1. Bag conveying means of the character described comprising a horizontal supporting table along which the bags are adapted to be intermittently moved, bag engaging elements adapted to engage the bags to move the same, vertically disposed racks serving to mount said elements to provide horizontally spaced groups of the same, means for imparting substantially rectangular motion to said racks and said bag engaging elements whereby said elements are caused to be projected alongside of the bags, translated longitudinally of said supporting table to move the bags therealong, retracted from the bags, and then returned to their initial positions, and means for causing a limited relative movement between adjacent racks to cause the elements of the same to engage both the trailing and advancing edges of bags while the bags are being moved over the supporting table.

2,773,342
MULTIPLE GANG DISK HARROW
Cyril M. Gladis, Aliquippa, Pa., assignor to Pittsburgh Forgings Company, Coraopolis, Pa., a corporation of Delaware
Application September 20, 1954, Serial No. 457,124
17 Claims. (Cl. 55—83)

1. In a disk harrow having front and rear pairs of laterally spaced gangs of disks, a frame arranged in a horizontal plane and having portions overlying each of said gangs, a universal mounting connecting each of said gangs to an overlying frame portion in a position with the longitudinal axis of each gang extending transversely of said frame, a linkage system controlling the angular movements of said gangs about their respective said universal mountings and including a front crossbar having connections with adjacent portions of said front pair of gangs, a rear crossbar having connections with adjacent portions of said rear pair of gangs, and means for moving said crossbars forwardly and rearwardly with respect to said frame for adjusting the angular positions of said gangs transversely with respect to said frame, and means interconnecting and mounting said linkage system for movement vertically with respect to said frame whereby tilting movement of one of said gangs about a horizontal axis imparts a vertical movement to said linkage system and is resisted by the remaining gangs through their said connections with said crossbars.

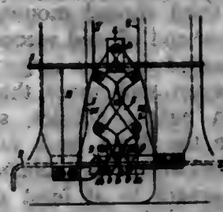
2,773,343
COOPERATING ROTATABLE DISK TYPE BEET HARVESTER
Heinz Carl Oppel, Boise, Idaho
Application October 16, 1952, Serial No. 314,145
3 Claims. (Cl. 55—100)

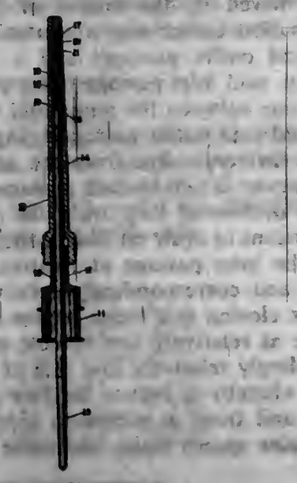
1. In a harvester for beets and like crops having a frame, a standard carried thereby, a pair of generally laterally, outwardly and downwardly extending axles fixed in generally opposed relation to the lower end of the standard, a wheel hub rotatably mounted on each axle, a one piece wheel casting secured to each hub, the wheel castings each comprising a central mounting portion, and a multiplicity of teeth extending radially outward from said portion, the teeth being trapezoidally shaped in cross section with wide flat faces facing toward the opposing wheel and narrowing in width to their outer faces.

---



2,773,344
VERTICAL TWISTING MACHINE
Charles F. van Heek, Fairhaven, N. J.
Application April 12, 1951, Serial No. 220,560
9 Claims. (Cl. 57—58.52)

1. In a vertical twisting machine of the kind described, the combination comprising a flyer mounted for rotation about a vertical axis, a cradle within said flyer, means for maintaining the cradle stationary during rotation of the flyer, a capstan box assembly including a box-like housing pivoted to the cradle, a shaft extending vertically thereof and rotatably mounted therein, a gear on the lower end of the shaft, capstans rotatably mounted in the housing, and gears connecting said shaft and said capstans.



2,773,345
SPINNING MACHINES, INCLUDING RING RAILS AND ANNULAR BALLOON LIMITERS
Walter W. Lenkert, Geneva, Switzerland, assignor to Rousselez, Tangier, a society of Tangier
Application June 29, 1955, Serial No. 518,985
Claims priority, application Luxembourg July 5, 1954
4 Claims. (Cl. 57—106)

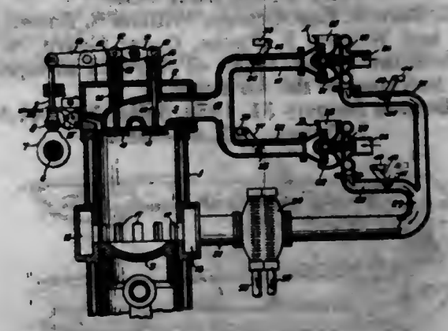
3. A spinning machine which comprises, in combination, a fixed frame, a plurality of spindles rotatable in said frame, a ring rail, said ring rail and the whole of said spindles being movable with respect to each other in a direction parallel to the axes of said spindles, said ring rail having with respect to said spindles a normal winding movement and a supplementary underwinding movement beyond the end of said normal winding movement, an annular balloon limiter coaxial with each of said spindles, a lazy-tongs device interposed between said ring rail and said balloon limiter for normally holding said balloon limiter at a substantial distance from said ring rail during the normal winding movement thereof, and abutment means carried by said frame and said lazy-tongs device for folding said lazy-tongs device toward said ring rail in response to said ring rail having a supplementary underwinding displacement.

---

2,773,346
TEXTILE SPINDLE
Richard L. Childs and Edward Crankshaw, Hopedale, Mass., assignors to Draper Corporation, Hopedale, Mass., a corporation of Maine
Application May 18, 1953, Serial No. 355,464
3 Claims. (Cl. 57—130)

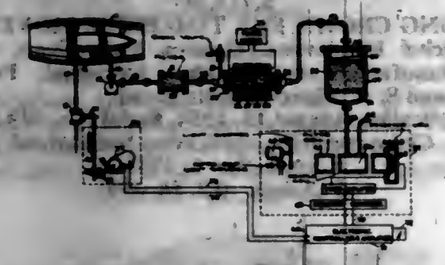
2. A top drive type textile spindle for supporting and driving a bobbin, said spindle having a blade, a whorl and means at the blade tip for imparting torque to a bobbin supported on the spindle which comprises an elongated blade end of reduced diameter, a shoulder defining the juncture between said blade and blade end, a cylindrical sleeve of a hard, resilient, moldable synthetic resin capable of longitudinal compression and corresponding lateral expansion when subjected to relatively great pressure directed against its ends, and thread means forming a part of said blade end for retaining said sleeve on said reduced end and further, being effective in conjunction with said shoulder, for developing that longitudinal compression in said sleeve such that the lateral expansion therein will cause it to grip the bore of a bobbin effectively to drive the same.

---



2,773,347
WINDING CROWN FOR TIMEPIECE MOVEMENT
Jean-Michel Froidevaux, Geneva, Switzerland, assignor to Manufacture des Montres Universal, Perret & Berthoud S. A., Geneva, Switzerland
Application August 13, 1954, Serial No. 449,591
Claims priority, application Switzerland September 1, 1953
6 Claims. (Cl. 58—90)

1. A tight watch-case crown construction comprising, in combination, a tubeless case having a stem opening in the side of the same, a crown having a tubular screw post of less diameter than said opening and extending freely therethrough, said crown having an inner annular recess about the post, a helical spring located in the recess and surrounding the post, an annular packing sleeve of compressible elastic material in close fitting engagement about the post, the inner surface of the packing sleeve being curved in axial section, a rigid washer arranged between the spring and the packing sleeve and axially movable within the recess of the crown, said sleeve being subjected to the action of the spring which urges it against the center of the watch-case about said stem opening therein and sealing the space between the case and the screw post extending therethrough, and a stop member arranged within the recess of the crown near the edge thereof in order to limit the displacements of the said washer.

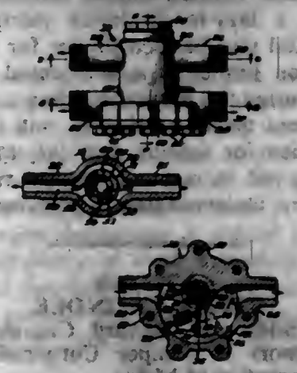


---

2,773,348
TURBO-CHARGER SYSTEM, INVOLVING PLURAL TURBINE DRIVEN SUPERCHARGERS
Emil Grieshaber and Paul S. Shirley, Milwaukee, Wis., assignors to Nordberg Manufacturing Co., Milwaukee, Wis., a corporation of Wisconsin
Application March 27, 1952, Serial No. 278,845
11 Claims. (Cl. 60—13)

1. The combination with a two cycle supercharged engine of a plurality of exhaust driven turbo-chargers, there being exhaust passages from the engine to the turbine of each turbo-charger and scavenging passages from the blower of each turbo-charger to the engine, valve means in each of the exhaust passages adapted to prevent flow of exhaust gas to at least one of the turbines and valve means in the scavenging passages between each blower and the engine to prevent counter flow of starting air from the engine to the blower during starting.

2,773,349
**INFRA-RED FUEL FLOW CONTROLLER**
Francis G. Bolle and Lucretia M. Whitney, Berkeley, Calif., assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware
Application April 28, 1953, Serial No. 351,572
1 Claim. (Cl. 60—35.6)

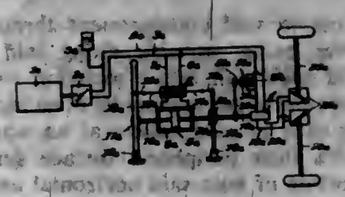


An apparatus for automatically regulating the fuel flow to an engine independent of the amount of air supplied thereto for controlling and maintaining the air-fuel ratio in said engine at a constant selected value, said apparatus comprising a jet engine, a fuel line to said engine, a fuel flow control valve in said line, conduit means for obtaining a portion of the exhaust gases from said engine, filter means in communication with said conduit means for removing solids from said exhaust gases, high temperature furnace means having a minimum operative temperature of 500° C. in communication with said filter for burning the unburned components of said gases, valved inlet means in communication with said furnace means for admitting oxygen thereinto to oxidize completely said exhaust gases to carbon dioxide, a drying chamber in communication with said furnace means for removing moisture from said gases, an infra-red gas analyzer adapted to analyze continuously the carbon dioxide content of the completely oxidized exhaust gases and to transmit an electrical signal proportional thereto, conduit means between said drying chamber and said analyzer for continuously circulating the dried gases through said analyzer, an electronic controller electrically connected to said analyzer, selector means on said controller adapted to be set at the air-fuel ratio at which the engine is to operate, valve-positioning means electrically connected to said controller and mechanically connected to said fuel flow control valve for varying the setting of said valve in response to variations in the signal from said controller.

2,773,350
**COMBUSTION CHAMBER ASSEMBLY FOR RAM JET FUEL BURNER**
Hilliard E. Barrett, East Orange, William S. Bower, Ridgewood, and William F. Payne, Cedar Grove, N. J., assignors to the United States of America as represented by the Secretary of the Air Force
Application January 31, 1950, Serial No. 141,562
7 Claims. (Cl. 60—35.6)

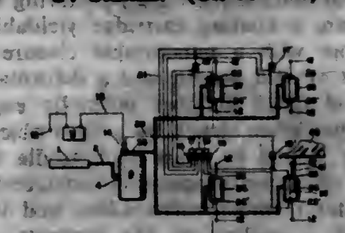
1. In a fuel burner adapted for ram jet operation a combustion chamber comprising a substantially cylindrical open end casing, a pilot burner mounted axially at one end of said casing, a first shroud surrounding said pilot burner, a plurality of gutters symmetrically mounted on the inner surface of said first shroud downstream from said burner said first shroud having also a plurality of openings between said gutters, louvers in said shroud adjacent to said openings disposed to give the flame of said burner a counterclockwise swirl, a pair of fuel annuli surrounding said first shroud, a plurality of main burner nozzles mounted exteriorly to but adjacent to said first shroud slightly downstream from the gutters therein, a second shroud concentric with said first shroud and extending downstream therefrom, said second shroud being attached to said first shroud by angled fins adapted to give the flame from said main burner nozzles a clockwise swirl, a third shroud mounted concentrically upon the downstream end of said second shroud and attached thereto by angled vanes, a larger number of main burner nozzles between said vanes than the first mentioned set of main burner nozzles, said vanes being angled to impart to the flame from said second set of main burners a clockwise swirl, connections from all of the aforesaid burners to at least one of said fuel annuli, and a plurality of structural members attached by one of their ends to a shroud for concentrically mounting said shroud assembly within said casing.

2,773,351
**POWER ACTUATED VEHICLE STEERING SYSTEMS**
Edwin Gustave Staude, Los Angeles, Calif.
Application December 30, 1955, Serial No. 556,606
12 Claims. (Cl. 60—52)

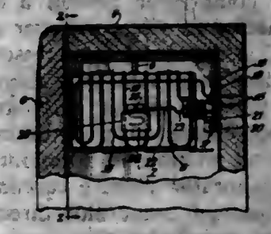


1. In a fluid volume control valve for a motor vehicle power steering system having a power unit operated by a pump driven by the engine of the motor vehicle, the combination comprising a control valve housing having inlet and outlet passages and a by-pass passage therebetween, said inlet passage being provided for connection in the line between the pump and the intake to the power unit, said outlet passage being provided for connection in the return line from the power unit to the pump, valve means in said by-pass passage, and means responsive to rate of flow of fluid from the pump for opening said valve means to draw off fluid through said by-pass passage from the inlet passage at relatively high vehicle engine speeds and correspondingly relatively high rate of flow and for closing said valve means to cut off said by-pass passage at relatively low vehicle engine speeds and correspondingly relatively low rate of flow of fluid from the pump, whereby to reduce the flow of fluid supplied to the power unit from a maximum supplied at said relatively low engine speeds when said valve means is closed.

2,773,352
**ROTARY PUMP AND MOTOR FLUID DRIVE**
Isao Fujii, Setagaya-ku, Tokyo-to, Japan
Application April 22, 1952, Serial No. 283,712
Claims priority, application Japan May 3, 1951
9 Claims. (Cl. 60—53)

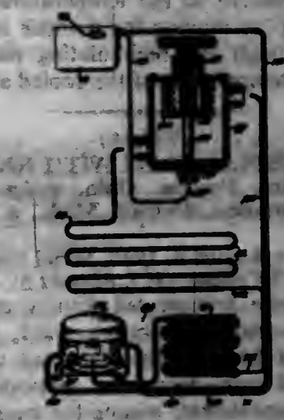


1. A pump and motor hydraulic system for use in transmitting power hydraulically from a prime mover to a driven means comprising, in combination, a fluid pump unit adapted to be driven by the prime mover, main fluid conduit lines for circulation of fluid from said pump to the driven means, and branch fluid conduit lines communicating with said main lines, said pump, said main conduit lines and said branch conduit lines providing a fluid circuit, and a control assembly acting upon the fluid in said circuit for varying the volume and direction of flow of the fluid supplied to the driven means, said control assembly including a direction control unit, a servo-motor mechanically connected to said direction control unit and supplied by fluid from said branch lines, a following valve connected in said branch lines for supplying fluid to said servo-motor for driving said motor in selected directions, and means for setting said following valve to control the movements of the servo-motor, said following valve comprising an outer cylindrical portion provided with first outlet and inlet connections communicating with said branch lines and second outlet and inlet connections communicating with said servo-motor, said inlet and outlet connections



communicating with the interior of said outer cylinder and a side opening axially spaced in said outer cylinder from said inlet and outlet connections and communicating with one of said second inlet and outlet connections, a valve cylinder member slidably positioned for axial movement inside said outer cylindrical portion, said valve cylinder having annular slots on its outer surface communicating with the interior of the valve cylinder, and a piston member slidably mounted inside said valve cylinder for axial movement therein, said valve cylinder being connected to a lever and said lever being connected to the piston of the servo-motor for simultaneous movement of said valve cylinder with said piston, and said piston valve member being connected to said setting means, whereby the fluid flow in said second outlet and inlet connections is reversed or cut off by moving said piston valve member and said valve cylinder to certain positions.

2,773,353
**WINDOW OPERATING OR ACCESSORY SYSTEM**
John R. Oishei, Buffalo, N. Y., assignor to Trico Products Corporation, Buffalo, N. Y.
Application May 18, 1953, Serial No. 355,473
14 Claims. (Cl. 60—60)



1. An accessory system for automotive vehicles, comprising in combination with a source of fluctuating suction, a fluid motor having a normally closed operational control valve, a suction line connecting the source to the motor, a reservoir having a normally closed inlet valve and a self-closing outlet valve interposed in the suction line between the source and the motor, the suction line beyond the reservoir being sealed off by said inlet valve to prevent the leakage of air into the reservoir, and a selector for simultaneously opening both normally closed valves.

2,773,354
**REFRIGERATOR DEFROST TERMINATION CONTROL SYSTEM**
Harry L. Tillman, Evansville, Ind., assignor, by mesne assignments, to Whirlpool-Seeger Corporation, a corporation of Delaware
Application May 4, 1953, Serial No. 352,918
3 Claims. (Cl. 62—2)

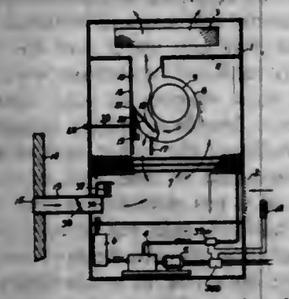
1. In a refrigeration system having an evaporator and a means for defrosting said evaporator, a defrost termination control comprising a container mounted to one wall of said evaporator in thermal contact therewith, a quantity of ice disposed within said container when said evaporator is operating on a refrigeration cycle, said container formed in the shape of an open trough so that any water frozen therein can expand without breaking said container and so that any water and ice lost therefrom by evaporation is replaced by defrost water flowing over the surfaces of said evaporator and into said trough-shaped container, a length of tubing being closed at one end thereof, a bellows, the other end of said length of tubing being connected to one end of said bellows, a certain amount of a gas disposed within said length of tubing and said bellows, said gas of an amount sufficient to cause the operation of said bellows on an expansion thereof responsive to a rise in temperature of the entire length of said length of tubing some temperature above the freezing temperature of water, said closed end of said length of tubing being disposed within said container whereby said closed end of said length of tubing is maintained at a temperature below the freezing temperature of water when said means for defrosting said evaporator is operating until said ice disposed within said container is melted, and means connected to the other end of said bellows and operating responsive to the operation of said bellows for terminating said means for defrosting said evaporator.

2,773,355
**TWO-TEMPERATURE REFRIGERATING SYSTEM**
Ralph W. Doeg, Detroit, Mich., assignor to Nash-Kelvinator Corporation, Detroit, Mich., a corporation of Maryland
Application June 23, 1953, Serial No. 363,460
3 Claims. (Cl. 62—3)

1. Refrigerating apparatus comprising, a refrigerant evaporator to function at a low temperature, a refrig-

2,773,361

erant compressor having a cylinder operatively connected to said evaporator having a relatively high capacity corresponding to the low temperature to be maintained by said evaporator, a refrigerant condenser operatively connected to the outlet of said compressor cylinder, a second refrigerant evaporator operatively connected to said condenser to receive liquid refrigerant therefrom, said compressor having a second cylinder operatively connected to said condenser and to said second evaporator, said second compressor cylinder having a capacity less than said first compressor cylinder and being in parallel circuit relationship therewith, and a pressure responsive valve connecting said evaporators in series circuit relationship to maintain the pressure in said second evaporator above a certain value and also connecting said second evaporator directly to said low capacity compressor cylinder.



---

2,773,356

## AIR COOLING SYSTEM WITH RECIRCULATING PASSAGEWAY

Robert C. Coblentz, Erie, Pa.

Application May 25, 1954, Serial No. 432,274
6 Claims. (Cl. 62—6)

1. In an air cooling system, a casing having an intake for air to be cooled and an outlet for cooled air, a subfreezing cooling heat exchanger within the casing in the path of the air flow between and spaced from the intake and outlet, a fan within the casing for producing a forced circulation of air from the intake over the heat exchanger to the outlet, the flow of air from the inlet side to the outlet side of the heat exchanger being unrestricted, a recirculating passageway within the casing spaced from and between the intake and the outlet from the casing and leading from the outlet side of the heat exchanger back to the intake side of the heat exchanger, a damper within the casing associated with the recirculating passageway and arranged on the outlet side of the heat exchanger at a point at which the cooled air has a positive pressure for deflecting part of the cooled air back from the outlet side of the heat exchanger through said passageway to the intake side of the heat exchanger for further cooling, and a thermostatic device within the casing and responsive to the temperature of the cooled air in the casing for moving the damper to cut down the flow of air through the recirculating passageway at a preselected low temperature of the cooled air in the casing.

---

2,773,357

## OPEN TOP DISPLAY CASE WITH NIGHT COVER

James A. Canter, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application August 4, 1955, Serial No. 526,502
7 Claims. (Cl. 62—89.5)

1. A self-service refrigerated display case comprising in combination, insulated bottom, back, front and end walls forming a horizontally elongated open top compartment in said case, means for supporting food products in said compartment, means for cooling air in said case, means for circulating the cooled air around said food supporting means and over food products thereon, substantially parallel members having integral horizontal and vertical walls mounted on top of the insulated end walls of said compartment, said members being disposed in opposite relationship relative to one another and forming tracks along said compartment end walls, a rigid night cover for said compartment extending continuously across the length thereof and overlapping a portion of said insulated end walls, said cover including a single roller at each of its corners adapted to support same on said tracks, said cover having a part thereof normally lying over said compartment back wall and

affording access to said compartment through its open top, said cover being movable along said tracks forwardly of said back wall into association with the front wall of said compartment to close its open top, and means for mounting each of said rollers at an acute angle on said cover with their peripheral surface simultaneously engaging a portion of both said horizontal and said vertical walls of said members whereby to prevent angular shifting of said cover on said tracks and binding of the cover during movement thereof along the tracks.

---

2,773,358

## SELF-COOLING CONTAINER

Paul C. Palmer, Phoenix, and Alfred O. Berry, Scottsdale, Ariz.

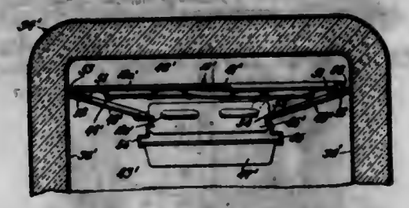
Application December 19, 1955, Serial No. 553,962
2 Claims. (Cl. 62—92)

1. A self-cooling container comprising, an inner receptacle, an outer member surrounding said receptacle, an insulative jacket surrounding said outer member, a bottom for said outer member, a puncturing needle fixed on said bottom, a cooling cartridge yieldably mounted on said bottom with a puncturable closure plug adjacent the point of said needle, and a deformable striking button on said outer member normally engaging said cartridge so that when struck by a hard object said cartridge will be moved to cause said needle to puncture said plug to cause an evaporative refrigeration gas to enter said outer member surrounding said inner receptacle to effect a cooling of the contents of said receptacle.

---

2,773,359

## ABSORPTION REFRIGERATION APPARATUS



Wilhelm Georg Kogel, Karl Gunnar Boren, and Axel Harald Ostergren, Stockholm, Sweden, assignors to Aktiebolaget Elektrolux, Stockholm, Sweden, a corporation of Sweden

Application July 1, 1952, Serial No. 296,672
Claims priority, application Sweden July 3, 1951
11 Claims. (Cl. 62—103)

1. A refrigerator comprising a cabinet having a thermally insulated interior defined by top, bottom, rear and

lateral side walls, an absorption refrigeration system comprising a gas circuit including a cooling unit having at least two sections disposed in the cabinet interior and comprising piping having active portions in which liquid refrigerant evaporates in the presence of an inert gas at a low average or mean temperature in one section and at a higher average or mean temperature in another section, means for flowing liquid refrigerant by gravity through said low and higher temperature cooling unit sections, respectively, means forming a part of said higher temperature cooling unit section which provides a relatively extensive heat transfer surface depending downwardly below said low temperature cooling unit section, said higher temperature cooling unit section taking up at least twenty-five percent less space between said lateral side walls than the overall width of said cooling unit

which extends a major portion of the distance between said lateral side walls, structure providing drip collecting and drainage surface means beneath said low temperature cooling unit section, said structure providing the drainage surface means having all parts thereof within a vertical range whose lower limit is at a level at least as high as the extreme lower portion of said higher temperature cooling unit section, said drainage surface means substantially in its entirety being offset laterally between said side walls with respect to said higher temperature cooling unit section and disposed alongside of the latter, said low and higher temperature cooling unit sections and drip collecting and drainage surface means forming a partition in the cabinet interior, and said higher temperature cooling unit section and drip collecting and drainage surface means, respectively, forming ceiling areas of that part of the cabinet interior which extends downwardly from said partition.

---

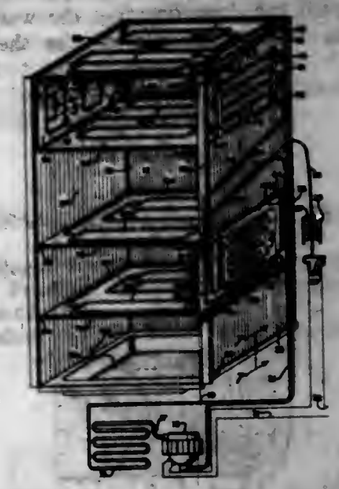
2,773,360

## VEHICLE REFRIGERATING APPARATUS

Marshall W. Baker, Hal C. Johnston, and Charles F. Heaney, Dayton, Ohio, assignors to General Motors Corporation, Dayton, Ohio, a corporation of Delaware

Application January 16, 1952, Serial No. 266,718
1 Claim. (Cl. 62—117)

In combination, a compressor, a variable speed power source for said compressor, a condenser, an evaporator, a receiver, refrigerant flow connections between said compressor, condenser, receiver and evaporator, said connections including a check valve between said condenser and said receiver, and a by-pass connecting the inlet of said compressor to said fluid flow means at a point between said condenser and said check valve whereby refrigerant may be circulated between said compressor and said condenser without passing through said receiver and said evaporator.



2,773,361

## REFRIGERATOR CABINET AND EVAPORATOR STRUCTURE

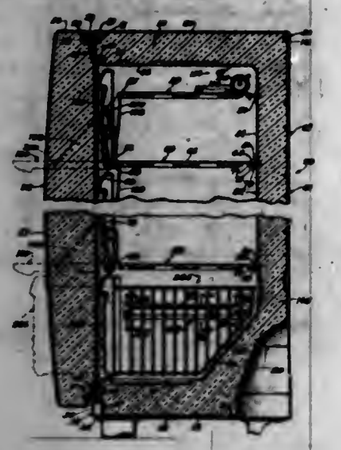
James W. Jacobs and Clifford H. Wertz, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application July 8, 1953, Serial No. 366,692
3 Claims. (Cl. 62—117.3)

2. In a refrigerator, a cabinet having an outer housing, an open ended substantially U-shaped metallic liner spaced from said housing forming the back and opposed side walls only of a chamber within said cabinet, a unitary substantially U-shaped sheet metal evaporator wholly disposed within said liner, the bight portion of said U-shaped evaporator intermediate arms thereof lying along and being secured to one of the opposed side walls of said chamber, one of said arms of the evaporator being substantially flush with the upper edge of said liner and secured thereto for closing the upper open end thereof to provide a top wall of said chamber, a pan member separate from and secured to said liner at its lower edge for closing the lower open end thereof to provide a bottom wall of said chamber, said one arm of said evaporator and said pan member tying the legs of said U-shaped liner to one another against relative movement therebetween, insulating material in the space between said housing and said liner, the other of said arms of the evaporator extending horizontally across said chamber and dividing same into an upper compartment and a lower compartment, said evaporator having refrigerant conveying passages formed in and traversing said arms and said bight portion thereof for cooling three walls of said upper compartment, means for supplying refrigerant to said passages and for withdrawing refrigerant therefrom, and said means including a conduit portion extending along said liner in contact therewith at a fourth wall of said upper compartment intermediate the ends of the arms of said evaporator whereby to cool four walls thereof.

---

2,773,362

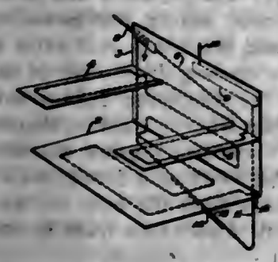


## REFRIGERATORS FOR FREEZING FOOD AND STORAGE OF FROZEN FOOD

Thomas G. Scheidler, Evansville, Ind., assignor, by mesne assignments, to Whirlpool-Seeger Corporation, a corporation of Delaware

Application May 18, 1953, Serial No. 355,615
8 Claims. (Cl. 62—117.3)

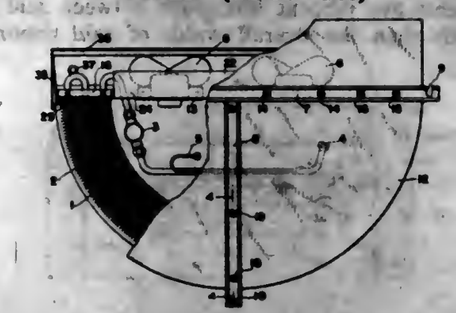
1. In a refrigeration system for frozen food storage, the combination of an insulated cabinet having an outer shell and an inner liner separated by insulation, and having a door opening and an insulated door; a motor compressor located at the rear bottom corner of said cabinet and partially housed in a recess in said shell, and including a motor with a motor housing, a compressor



carried below the motor and driven thereby, and located in an oil sump below the motor housing, a plurality of evaporator shelves carried by the walls of the liner, and having freezing coils connected in series with each other, a main condenser including said outer shell, and sinuous tubing carried by the sides, back, top, and bottom of the shell on its inside, the said tubing extending forwardly on both sides of the shell and having U-bends located adjacent the door opening, the warm condenser tubing raising the temperature of the shell about the

door opening and breaker strips to a point above the dew point to prevent condensation about the door opening, and a pre-cooler condenser carried by the motor compressor behind said cabinet, said compressor having its outlet directly connected to said pre-cooler, said pre-cooler discharging into the top of the motor housing, said motor housing having an upper conduit leading to said main condenser, a capillary tube restrictor extending from said main condenser to said evaporator shelves, and a suction conduit extending from the evaporator shelves to the suction inlet of the compressor.

---



**2,773,363**
**REFRIGERATOR EVAPORATOR WITH DEFROSTING MEANS**
**Si J. Williams, Jr., Evansville, Ind., assignor, by mesne assignments, to Whirlpool-Seeger Corporation, a corporation of Delaware**
**Application December 29, 1952, Serial No. 328,449**
**9 Claims. (Cl. 62—126)**

1. An evaporator adapted for use and disposition wholly within a compartment formed in a refrigerator cabinet comprising a horizontally disposed base and a vertically disposed rear wall attached thereto, a first length of serpentine tubing formed in said base and in said rear wall, a second length of tubing connected in parallel to said first length of serpentine tubing, a portion of said second length of tubing being convoluted and depending from said rear wall below said base, a section of said portion of said second length of tubing extending in a diagonally downward direction, whereby liquid refrigerant collects in said section of said portion of said second length of said tubing when said evaporator is connected in a refrigerator, heating means mounted in thermal contact with said section of said portion of said second length of tubing for heating said section to cause said liquid refrigerant to assume a hot gaseous state, said first length of serpentine tubing being convoluted so that the hot gases are projected throughout said first length of said serpentine tubing when said liquid refrigerant is heated to said hot gaseous state.

---

**2,773,364**
**COOLER UNIT**
**David B. Zipser, Baltimore, Md., assignor to Tenney Engineering, Inc., Newark, N. J., a corporation of New Jersey**
**Application December 21, 1953, Serial No. 399,290**
**2 Claims. (Cl. 62—140)**

1. In a ceiling-mounted cooler unit of generally semi-circular shape incorporating a coil located around the curved periphery of the unit, the combination of a ceiling plate; coil suspension means depending therefrom and supporting the coil at each of its ends; coil hanger means depending from the ceiling plate intermediate the ends of the coil; a fixed drain pan depending from the coil suspension means and extending across the diameter of the unit beneath the coil ends; a drip-closure plate extending beneath the coil and the space enclosed by it, with its rearward edge above and overlapping the forward edge of the drain pan; means associated with the coil suspension means for slidably supporting the rear of the drip-closure plate; and means for removably securing the forward edge of the said drip-closure plate to the coil hanger means.

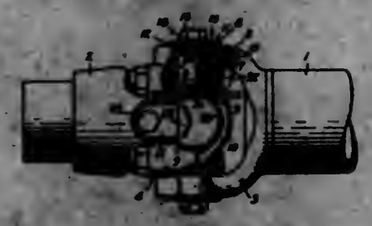
**2,773,365**
**VIBRATION-DAMPING HUB AND SHAFT ASSEMBLIES**
**George A. Delf and Glenn A. Delf, St. Louis, Mo.**
**Application November 23, 1953, Serial No. 393,838**
**6 Claims. (Cl. 64—11)**

1. In a shaft-driven rotary assembly subject to communication of vibrations between a rotary member and a shaft, a drive shaft, a hub secured to the shaft, a rotary member including a center disc, said center disc being provided with a plurality of apertures, a bushing structure of a non-metallic resilient material, the center disc being provided with a central hub aperture the margins of which are spaced from the hub, the resilient material being disposed between the hub and the center disc in the region of the central hub aperture, and overlying the opposite faces of the center disc under compression such that portions of the resilient material extend into said apertures of said center disc, a shoulder formation on said hub, said shoulder formation being provided with

a plurality of projections, a plate element provided with a plurality of recesses adapted to receive and be interfitted by said projections, the resilient material disposed adjacent said plate element under compression so that a portion extends into the recesses of said plate element, a second plate element mounted on said hub, and provided with a plurality of recesses, said resilient material having portions on the other side of said center disc that extend into the recesses of said second plate element, and means including portions of the hub for axially and angularly fixing the center disc, plate elements, and resilient material to the hub.

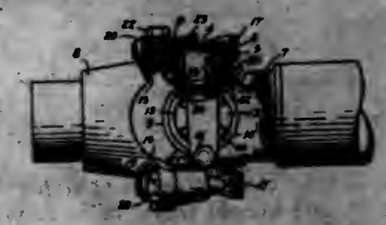
---



**2,773,366**
**SEALED UNIVERSAL COUPLING TRUNNION BEARINGS**
**William W. Slaght, Rocky River, Ohio, assignor to Cleveland Steel Products Corporation, Cleveland, Ohio, a corporation of Ohio**
**Application December 31, 1952, Serial No. 328,974**
**12 Claims. (Cl. 64—17)**

1. In a universal coupling having a yoke provided with an arm spaced laterally from the axis of rotation of the coupling and a cross having a trunnion journaled in said arm, the combination therewith of a sealed bearing for said trunnion comprising a cup bearing attached to said yoke and receiving said trunnion, means on said cross forming an annular channel concentric with said trunnion and receiving the inner end of said cup bearing, and an elastic and flexible sealing ring fitting in said channel and confined between the inner end of said cup bearing and the bottom of said channel, said sealing ring having inner and outer spaced annular bearing portions in sliding contact with said cup bearing and an annular channel between said bearing portions for retaining a body of lubricant so positioned that the lubricant will be pressed by centrifugal force against said cup bearing between said bearing portions during rotation of the coupling.

---

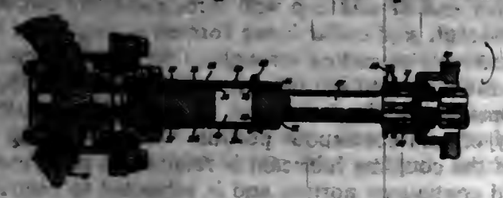


**2,773,367**
**SEALED TRUNNION BEARINGS IN UNIVERSAL COUPLINGS OF THE CROSS AND YOKE TYPE**
**William W. Slaght, Rocky River, Ohio, assignor to Cleveland Steel Products Corporation, Cleveland, Ohio, a corporation of Ohio**
**Application July 26, 1952, Serial No. 301,036**
**8 Claims. (Cl. 64—17)**

1. In a universal coupling having a yoke provided with an arm spaced laterally from the axis of rotation of the coupling and a cross provided with an arm extending outwardly from said axis of rotation and terminating in a trunnion, the improvement which comprises: a sealed bearing for said trunnion comprising a bearing cup on said trunnion and attached to said arm, said cup having a peripheral wall surrounding said trunnion and terminating adjacent the inner end thereof, and a flexible and elastic sealing collar surrounding said trunnion arm and having a circumferentially continuous portion engaging the inner end of said cup wall throughout the circumference thereof, said collar being formed to provide a lubricant reservoir extending throughout its circumference between the inner end of said cup wall and the coupling axis and opening to the inner end of said wall radially inwardly of said continuous portion, whereby during rotation of the coupling lubricant is retained in said reservoir by said continuous portion and is subjected to centrifugal force tending to cause outward flow between the outer end of said collar and said bearing cup.

---

**2,773,368**
**UNIVERSAL COUPLINGS WITH SEALED BEARINGS**
**William W. Slaght, Rocky River, Ohio, assignor to Cleveland Steel Products Corporation, Cleveland, Ohio, a corporation of Ohio**
**Application May 22, 1952, Serial No. 289,367**
**1 Claim. (Cl. 64—17)**



A universal joint comprising a cross with arms each terminating in a trunnion and having two pairs of axially alined trunnions, each of said arms having a yielding resilient sealing ring extending around the same inwardly of said trunnion, means for securing said rings to said arms and holding the same against bodily movements axially of the trunnions, a bearing on each trunnion that has an internally cylindrical sleeve and rollers within the sleeve that have rolling engagement with the trunnion and sleeve, said sleeve having an inner end face slidably engaging said sealing ring and being provided with an external groove extending around the same near its inner end, a combined sealing and bearing retaining collar of elastic rubber having an outer end portion embracing said sleeve and engaging in said groove, an inner end portion embracing said arm inwardly of said sealing ring and an outwardly bulged thin flexible tubular wall connecting said end portions, yokes having arms to which said bearing sleeves are attached, one of said yokes having arms provided with open sleeve receiving seats alined transversely of the yoke axis, stop plates attached to said arms for engagement with the outer ends of the sleeves engaging the seats, said plates having inclined outwardly flaring outer end portions for engagement with the outer ends of axially alined sleeves to move the said sleeves inwardly on said trunnions and press the same against said yielding resilient sealing rings, and means for clamping the bearing sleeves to said open seats.

---

**2,773,369**
**TORQUE LIMITING DEVICE FOR TRACTOR**
**Herman G. Klemm, Birmingham, Mich., assignor, by mesne assignments, to Massey-Harris-Ferguson Inc., Racine, Wis., a corporation of Maryland**
**Application March 9, 1954, Serial No. 414,923**
**5 Claims. (Cl. 64—28)**

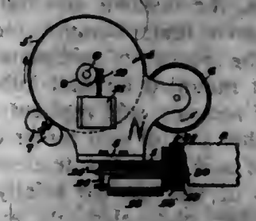
1. In a tractor having a low speed transmission the combination comprising a drive shaft, a driven shaft in alinement therewith, a metallic sleeve telescoped over said shafts and having a splined connection with each of them, said sleeve having a circumferential groove formed therein between said splined connections, disengageable means

for preventing telescoping movement between said sleeve and either of said shafts, one of said shafts extending into said sleeve beyond said groove so that upon shearing of

said sleeve at said groove both halves of said sleeve are maintained in their normal axial relation in place on said shafts.

---

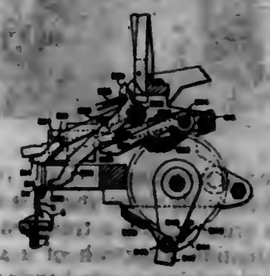
2,773,370
TORQUE LIMIT CLUTCH
Julius Istranik and Martin O. Kalb, New York, N. Y.
Application April 24, 1953, Serial No. 351,065
7 Claims. (Cl. 64—29)
(Granted under Title 35, U. S. Code (1952), sec. 266)



1. A torque limit clutch comprising a driver shaft and a driven shaft, one of said shafts being formed with an axial cylindrical recess at one end, one end of the other of said shafts nesting within the recess in said one of said shafts, the one end of said one shaft having the recess further formed with a plurality of radial passages, all of the passages being in a single transverse plane and communicating with the axial cylindrical recess, a circular series of depressions, each of predetermined configuration, formed adjacent the one end of said other shaft at such distance from the end thereof that the plane of the radial passages in said one shaft and the plane of depressions in said other shaft coincide when said other shaft is properly nested in the recess in said one shaft, a bearing sleeve between the contiguous ends of said two shafts, a plurality of torque transmitting members engaging said driver and said driven shafts, said torque transmitting members positioned in the radial passages in said one shaft and adapted to seat in the depressions in said other shaft, biasing means for said torque transmitting members, said biasing means including a plurality of flat springs equal in number to the radial passages in said one shaft and fastened at one of their ends to extend longitudinally of said one shaft so that their free ends overlay the radial passages, said flat springs being bowed when the free ends thereof abut said torque transmitting members in the corresponding radial passages for firmly seating them in the depressions in said other shaft, an adjusting means for said biasing means, said adjusting means comprising a nut adapted to vary the degree of bow in the flat springs to thereby vary the force exerted upon the torque transmitting members for seating them in the depressions in said other shaft, a locking means for said adjusting means, and a second locking means for preventing relative axial movement of said shafts.

---

2,773,371
APPARATUS FOR AND METHODS OF MAKING AN APPLIQUE KNITTED FABRIC
David Pelton Moore, Glen Oaks, N. Y.
Application January 10, 1952, Serial No. 265,782
11 Claims. (Cl. 66—9)



1. A method of making an applique knitted fabric, which consists in feeding basic yarn into the needles of a knitting machine during the knitting operation to make a jersey type fabric, and while so knitting jacquard-control feeding of short loose fibers to selected needles during

the knitting operation to knit in with the basic yarn scattered plush designs.

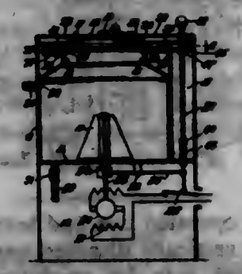
---

2,773,372
KNITTING MACHINE
Stanley R. Shelmire, Laconia, N. H., assignor to Scott & Williams, Incorporated, Laconia, N. H., a corporation of Massachusetts
Original application April 2, 1952, Serial No. 280,050. Divided and this application October 5, 1954, Serial No. 460,328
6 Claims. (Cl. 66—140)

1. A circular knitting machine comprising a needle cylinder, needles carried by said cylinder, yarn feeding means, means for producing relative reciprocatory movements between said cylinder and said yarn feeding means, said yarn feeding means comprising a group of yarn fingers associated at a common feed, means for selectively moving said yarn fingers into and out of action, and yarn clamping means located within the needle circle and associated with said group of yarn fingers, said clamping means comprising a pair of clamping elements, resilient means providing clamping pressure between said elements, and additional means for augmenting said clamping pressure.

---

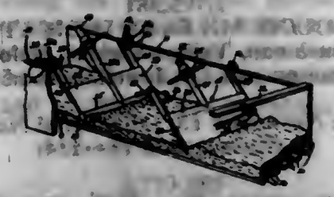
2,773,373
COMBINATION WASHER AND WASH TUBS
James W. Corson, Aztec, N. Mex.
Application September 28, 1954, Serial No. 458,736
3 Claims. (Cl. 68—13)



1. A combination washer and wash tub assembly comprising a washer, a wringer, means swingably mounting said wringer on said washer and enabling said wringer to be moved into overlying position with respect to said washer, a pair of tubs, one of said tubs being smaller than the other of said tubs said tubs being hingedly attached to said washer by means of hinges with the axes of said hinges being substantially horizontal and with

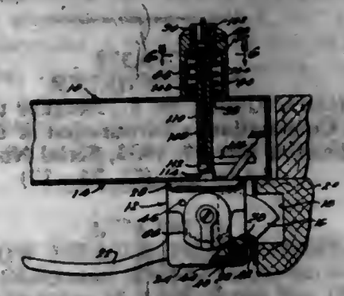
the tubs being swingable into overlying relationship with respect to said washer with a first of said tubs encasing said wringer and the other of said tubs encasing said first tub, said tubs having recesses in the bases thereof, a plurality of legs, and means attaching said legs to said tubs enabling said legs to seat in said recesses flush with said tubs when folded and enabling said legs to support said tubs when extended.

---



2,773,374
LAUNDRY MACHINE HAVING DETACHABLE COVER
Tord Erik Daniel Blide, Stockholm, Sweden, assignor to Aktiebolaget Elektrolux, Stockholm, Sweden, a corporation of Sweden
Application January 22, 1952, Serial No. 267,655
Claims priority, application Sweden January 23, 1951
9 Claims. (Cl. 68—133)

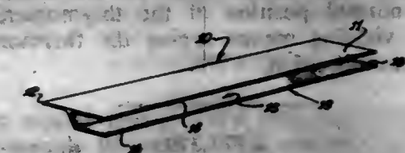
1. In combination with a laundry machine having a receptacle formed with an access opening and a cover therefor, the access opening being defined by a rim having an inner face, means for holding the cover in a closed position at the access opening with the peripheral edge thereof located against the inner face of the rim, mechanism for effecting at least one step in the washing of laundry in the receptacle, and control means for starting and stopping said mechanism, said control means including structure operable to stop said mechanism responsive to movement of the cover from its closed position at the access opening.



---

2,773,375
FIBER WET-TREATING APPARATUS
Charles W. Cox, Decatur, Ala., assignor to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware
Application May 25, 1953, Serial No. 357,164
14 Claims. (Cl. 68—205)

1. An apparatus for treating a running blanket of fibrous material, said apparatus including a conveyor having a permeable surface on which said fibrous material is adapted to be disposed, means for discharging a narrow stream of liquid angularly toward said permeable surface, said liquid stream being of sufficient velocity to substantially penetrate and convert said fibrous blanket on said permeable surface into a liquid suspension of fibrous material, baffle means connected in juxtaposed relationship with said liquid discharge means, said baffle means being adapted to prevent backwashing of said liquid suspension of fibrous material, and means for supporting said baffle and liquid discharge means for movement as a unit relative to said conveyor.

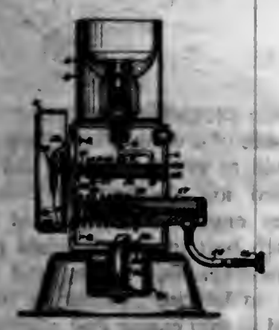


2,773,376
DOOR LATCH AND LOCK
George Wartian, Detroit, Mich., assignor to Wartian Lock Company, St. Clair Shores, Mich., a corporation of Michigan
Application June 10, 1954, Serial No. 435,813
11 Claims. (Cl. 70—150)

1. A door latch comprising a casing adapted to be mounted on one side of a door, a latch bolt pivoted in said casing and adapted to swing into and out of said casing between unlatched and latched positions thereof, an actuating member engageable with said latch bolt for swinging said latch bolt to its unlatched position, spring means reacting between said casing and latch bolt and urging the latter to latched position, a locking member movably mounted in said casing and adapted to be moved ipto the path of movement of said latch bolt to lock said latch bolt in its latched position against movement by said actuating member, a slidable and rotatable plunger adapted to be mounted on the other side of the door, said plunger being manually depressible and operable upon depression thereof for moving said latch bolt to its unlatched position, said plunger upon rotation thereof being engageable with said locking member for moving the same to and from its locking position, and key-operated lock means associated with said plunger for locking the latter against rotation.

---

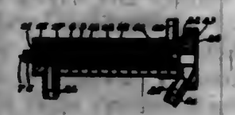
2,773,377
FEATHEREDGE
Robert K. Squire, Los Angeles, Calif., assignor to Superior Scaffold Company, Culver City, Calif., a corporation of California
Application July 10, 1953, Serial No. 367,145
2 Claims. (Cl. 72—136)



1. A featheredge comprising an elongated substantially flat plate member having a pair of substantially parallel and substantially straight line opposite longitudinal edges, a second substantially flat plate member disposed in a plane substantially parallel with and spaced from said first mentioned plate member and having a pair of substantially parallel and substantially straight line opposite edges, said members being oriented with all said edges substantially in parallel relationship with one another, a first of said second member edges being oriented over said first member and intermediate said two edges of said first member, and a third plate member having a pair of substantially parallel and substantially straight line opposite edges, a first of said edges of said third member being integral with said first member along a line intermediate said two edges of said first member and uniformly spaced from a first of said edges of said first member, and the second of said edges of said third member being integral with said second member along said first edge of said second member, said second edge of said third member being rearward of said first edge of said

third member relative to said first edge of said first member, to provide an inclined portion along said third plate member adapted to be contacted by fingers of a user when the second edge of the second member is grasped by the thumb, whereby said second and third plate members form a hand grip for grasping the featheredge in use.

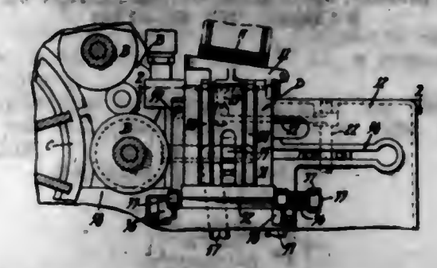
---



2,773,378
FREEZEMETER
E. Elliott Hood, Elmira, N. Y., assignor to Bendix Aviation Corporation, a corporation of Delaware
Application July 27, 1953, Serial No. 370,366
2 Claims. (Cl. 73—17)

1. In a freeze-test meter for arctic coolants for internal combustion engines, a thermometer having a movable indicating element and a cylindrical stem containing its heat-sensitive element, a frost tube of slightly larger internal diameter than the external diameter of the thermometer stem, surrounding the portion of said stem containing the heat-sensitive element, means including packing means for closing the space between the thermometer stem and the frost tube and maintaining the tube and stem in coaxial relation to provide a sample holder while permitting relative rotation thereof, means for introducing a sample of the liquid to be tested into the space surrounding the thermometer stem within the frost tube, means for cooling said tube below the freezing point of the sample, and means for accelerating the transfer of heat through the sample and for promoting solidification of the sample by oscillating the thermometer stem in the frost tube; including further a frame, means for rotatably mounting the thermometer in the frame, means for defining the normal position of the thermometer in the frame and yielding means urging the thermometer toward its normal position.

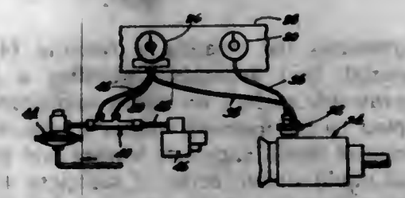
---



2,773,379
FREEZEMETER
E. Elliott Hood, Elmira, N. Y., assignor to Bendix Aviation Corporation, a corporation of Delaware
Application July 27, 1953, Serial No. 370,381
2 Claims. (Cl. 73—17)

1. In a device for determining the freezing point of liquid coolants for internal combustion engines, a thermometer having a smooth cylindrical stem, a frost tube of substantially larger diameter than said stem coaxially mounted thereon, means adjacent the ends of the tube for sealing the space between the thermometer stem and the interior of the tube, means for introducing a sample of liquid to be tested in said space, means for cooling the tube below the freezing point of the sample, heat conductive movable means in said space in contact with the thermometer stem and the interior wall of the frost tube, for agitating the sample of liquid and promoting transfer of heat through said space, and manually operable means for actuating said movable means; in which the movable means comprises a coiled spring having spaced convolutions loosely fitting in the space around the thermometer stem within said frost tube.

---

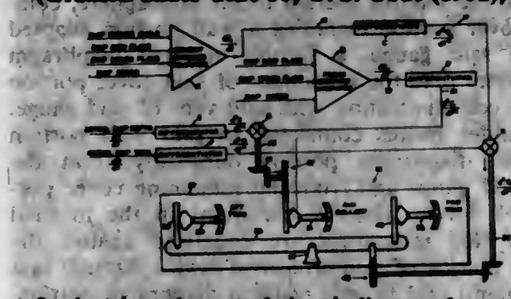


2,773,380
FEEDING DEVICE FOR CAN END TESTING MACHINE
Benjamin L. Hoyne, Jersey City, N. J., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application October 1, 1952, Serial No. 312,545
11 Claims. (Cl. 73—45.2)

1. In a power operated can end testing machine having a plurality of vertically disposed tester heads movable in a predetermined path for receiving can ends to be tested, the combination of a magazine for holding can ends in stacked formation, a substantially horizontal can end support under said magazine, means for separating the lowermost can end from said magazine and laying it on said support, means for propelling said separated can end along and from said support, a pair of spaced tracks leading from said support to a transfer station, a pair of vertically disposed curved guide rails aligned with and in spaced relation to said tracks for guiding the leading edge of said can end and thus cooperating with said tracks in receiving said separated can end in a substantially horizontal position from said propelling means and for guiding and turning said can end about an axis in transverse relation to its downward path as it drops from said support to a substantially vertical position at said transfer station, means disposed at said transfer station for locating the can end in alignment with a said tester head, and means for advancing the can from said station in said tester head for testing.

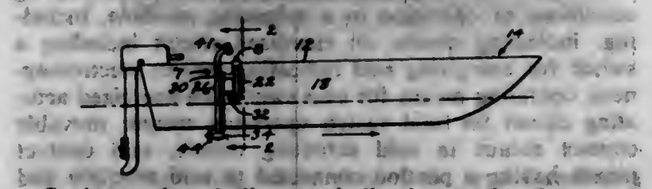
---

2,773,381
GASOLINE MILEAGE INDICATOR
William S. Touchstone, Yellow Springs, Ohio, assignor to Pere C. Sorensen and Lee Jewell, both of Wauwatosa, Wis.
Application November 15, 1952, Serial No. 320,760
12 Claims. (Cl. 73—114)



1. In an engine efficiency meter, the combination comprising a rotor member, at least three weight members equally circumferentially spaced about and mounted on said rotor member and normally extending at an acute angle to the axis of rotation of said rotor member, axle means for pivotally mounting each of said weight members on said rotor member, a plurality of levers respectively rigidly connected with said weight members and extending generally radially inwardly, a member freely supported by inner ends of said levers, pivot members respectively connecting the inner ends of said levers with said freely supported member, each of said pivot members being disposed radially with respect to the rotor member axis, each of said axle means having portions thereof freely disposed within recess means in one of said members, said recess means having dimensions greater than said portions of said axle means and partially defined by an elongated substantially flat bearing surface means extending radially of said rotor member to provide reduced frictional contact between said portions of said axle means and surfaces of said recess means and to permit said axial portions to shift along said flat bearing surface means upon pivotal movement of the weight members and levers under the influence of centrifugal force, means for driving said rotor member in response to engine performance, said weight members being movable by centrifugal force upon driving said rotor member to create a force on said freely supported member, means responsive to fuel flow through an engine fuel line for creating a force substantially proportional to the square of the fuel flow, and means for combining the forces created by the functioning of said fuel flow responsive means and the functioning of said weight members to indicate engine efficiency.

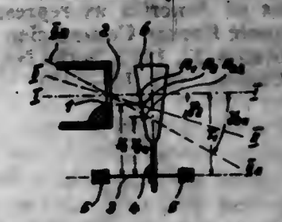
---



2,773,382
SUBMARINE TRIM INDICATOR
Woodford M. Read, Hicksville, N. Y.
Application July 3, 1952, Serial No. 297,192
2 Claims. (Cl. 73—178)
(Granted under Title 35, U. S. Code (1952), sec. 266)

2. A trim characteristics indicator for a submarine comprising a differential, rotatable means connected to said differential to indicate forward and aft trim, a multiple indicator unit comprising a plurality of spaced indicators and means connecting said first rotatable means with first and second of said indicators whereby the trim differences are detected automatically, said connecting means comprising an off-centered pivoted lever arm, means connecting one end of the arm to said first indicator, and means connecting the other end of the arm to said second indicator to display the difference between the forward and aft trim of the submarine.

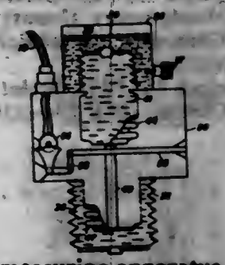
---



2,773,383
SPEEDOMETER AND ODOMETER FOR BOATS
Herbert H. Kersten, Fort Dodge, Iowa
Application February 11, 1955, Serial No. 487,583
8 Claims. (Cl. 73—187)

7. A speed and distance indicating device for small boats comprising an elongated supporting member having a lower end and an upper end, impeller means supported by the lower end of said supporting member, a speedometer-odometer mounted on the upper end of said supporting member, means forming a driving connection between said impeller means and the speedometer-odometer, a mounting clamp adapted to be secured to a part of a boat, a sleeve swivelly supported by said clamp in an outboard position, a supporting arm fixed to and extending laterally from said sleeve and connected to said supporting member for mounting the supporting member in substantially a vertical position and with the lower end thereof in a submerged position, said sleeve swivelling about a vertical axis whereby said supporting member will assume a trailing position relative to the sleeve with respect to the direction of travel of the boat.

---

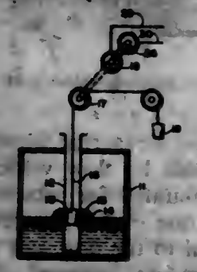


2,773,384
GAS FLOW MEASURING EQUIPMENT
Hans Gehre, Oberkassel (Rhine), Siegkreis, Germany
Application October 30, 1950, Serial No. 192,995
In Germany August 15, 1949
Public Law 619, August 23, 1954
Patent expires August 15, 1969
9 Claims. (Cl. 73—230)

1. In an axial flow measuring wheel meter for measuring volumes of fluids by flow velocity measurement, a measuring wheel mounted for rotation about an axis extending in the direction of flow, an orifice plate positioned substantially normal to the flow axis of the meter having a plurality of apertures arranged circularly about said axis, and collectively defining a throttle opening for directing fluid passing therethrough to impinge on said measuring wheel, said apertures being divided into a first section, a second section, and a third section, each of said sections consisting of at least one aperture, the aperture of said first section having two opposing profiles with contrasting flow characteristics, the aperture of said second section having two opposed profiles with flow characteristics similar to each other, the aperture of said third section having two opposing profiles with flow characteristics similar to each other, but contrasting to the flow characteristics of said second section.

---

2,773,385
SHORE WAVE RECORDER (SHALLOW WATER)
Joe W. Johnson, Berkeley, Calif., assignor to the United States of America as represented by the Secretary of the Navy
Application June 28, 1954, Serial No. 439,945
3 Claims. (Cl. 73—301)



2. In pressure measuring apparatus for measuring pressure changes due to the overhead passage of large waves and low swells from points below the surface of the water, underwater means responsive to the average sea water pressure around said means, underwater means responsive to an instantaneous sea water pressure, differential pressure responsive means connected to both said means and directly movable in response to the differen-

tial pressure between both said means, and combined sharp-based and underwater measuring means having an underwater portion connected to said differential pressure responsive means and a sharp-based portion connected to said underwater portion for measuring said differential pressure, said underwater means responsive to the average sea pressure comprising a housing, a bellows mounted in said housing, a non-corrosive bellows mounted over said first named bellows and in communication therewith, a quantity of fresh water filling the combined volume enclosed by said bellows, a closed container having a filter covered opening therein to admit sea water of average pressure, said non-corrosive bellows being disposed in said container and exposed to sea water of average pressure therein, said sea water being of an average sea water pressure around said non-corrosive bellows and including the pressure due to tides.

---

2,773,965
**LIQUID LEVEL INDICATOR**
Earl O. Swichard, Jr., Los Alamos, N. Mex., assignor to the United States of America as represented by the United States Atomic Energy Commission
Application February 21, 1955, Serial No. 489,816
3 Claims. (Cl. 73—313)

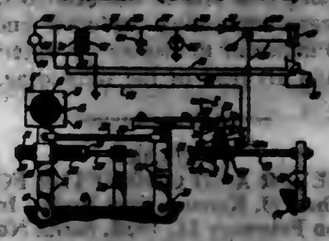
1. An apparatus for indicating the level of a liquid in a closed container comprising a high-mu ferromagnetic toroidal element supported inside a float, a non-ferromagnetic tube having a closed bottom end and a length greater than the depth of the container and being sealed to and supported vertically by the top of the container so that it depends in said container, said float surrounding and freely slidable along said tube and floating on the surface of said liquid, a differential transformer having a length approximately equal to the height of the float and being slidably supported within said tube, said transformer adapted to produce an unbalance voltage when asymmetric in relation to said toroidal element, remote means responsive to an unbalanced voltage for moving said transformer to a symmetric balanced voltage position, said symmetric position having a known relation to the level of the liquid.

---

2,773,967
**LIQUID LEVEL GAGE**
Frank W. Miller, Montgomery County, Pa., assignor to Yarnall-Waring Company, Philadelphia, Pa., a corporation of Pennsylvania
Application August 18, 1953, Serial No. 374,962
15 Claims. (Cl. 73—330)

1. In a liquid level gage, a gage body having an interior vertical passage with side openings, connections to the passage at the top and bottom, opposed gage glasses on opposite sides of the body closing the side openings and adapted to transmit light through the side openings, covers provided with openings generally corresponding to the openings in the body, located on the outsides of the gage glasses and means for applying pressure to the covers to anchor the gage glasses in place against the body, in combination with metallic shields, each having a thickness of between 0.004 and 0.040", each having an opening generally corresponding with the openings in the body, interposed between the gage glasses and the body and having a flange extending generally at right angles to the shield and in spaced relation to the gage body inwardly into the vertical passage continuously over the top and sides of the opening.

---

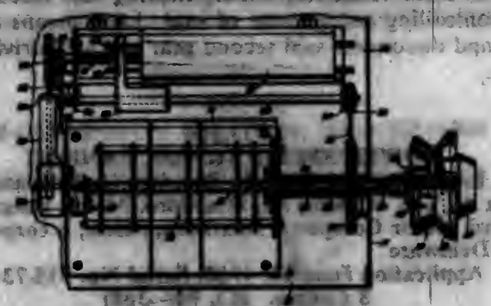


2,773,968
**PROTECTIVE HOUSING FOR INSTRUMENTS**
Thomas W. Preuss, Riverside, Calif.
Application August 18, 1952, Serial No. 304,896
10 Claims. (Cl. 73—431)

8. A protective device adapted to seal and prevent the entrance of dirt, moisture and other foreign matter into the interior of a vacuum gauge including a casing having a vent from the interior thereof to the atmosphere, comprising a cover portion including a wall portion adapted to envelop said gauge, a flexible resilient diaphragm portion thinner than the remainder of said cover portion which is in communication with said vent of said gauge, and a shoulder means connected to said wall portion spacing said diaphragm portion outwardly from the casing of said gauge and from the remaining cover portion of said device whereby variations in the internal pressure of said instrument are equalized against the atmosphere outside of said protective device through said vent and against said flexible resilient diaphragm portion.

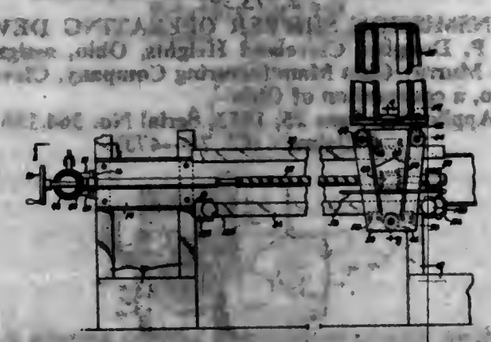
---

2,773,969
**BALANCING MACHINE INDICATOR**
William F. King, Royal Oak, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application March 15, 1951, Serial No. 215,715
9 Claims. (Cl. 73—462)



1. Apparatus of the character described for indicating conditions of operation in a balancing machine, including: indicating means; an energized circuit including a switch for energizing said indicating means; electromagnetic operating means for said switch; an energized actuating circuit for said switch operating means; movable contact means in said actuating circuit, said contact means having a portion connected to said machine and movable in accordance with the amount of unbalance in the operation thereof to close said actuating circuit periodically for time durations increasing with the amount of unbalance; and a condenser connected across said switch operating means to control the operation of said switch operating means as a function of time duration during which said actuating circuit is closed.

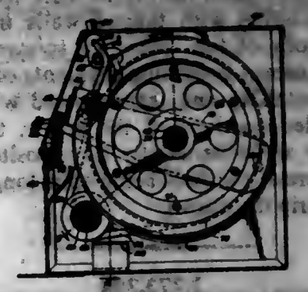
---



2,773,390
**PLURAL TUNER DRIVE**
Richard C. Osler, Elmhurst, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois
Application July 14, 1953, Serial No. 367,952
10 Claims. (Cl. 74—10.49)

1. A tuner assembly for a television receiver or the like including in combination, a first tuning unit having front and back ends, a drive shaft for said first unit extending from the front end thereof, a first indicator knob affixed to the end of said shaft remote from said first tuning unit and having a viewing aperture therein, a second tuning unit having front and back ends, said second tuning unit being mounted adjacent said first tuning unit, a main drive shaft for said second unit extending from the back end thereof, an auxiliary drive shaft for said second unit rotatably mounted within said drive shaft of said first unit and having a portion extending through the back end of said first unit, means for coupling said portion of said auxiliary drive shaft to said main drive shaft of said second unit to establish a driving connection to said second unit, an indicator drive shaft rotatably mounted on said drive shaft of said first unit in coaxial relation therewith, a second indicator knob mounted on said indicator drive shaft and nested within said first indicator knob to be viewable through the aforesaid aperture in said first indicator knob, and means for coupling said main drive shaft of said second tuning unit to said indicator drive shaft to establish a driving connection from said second unit to said second indicator knob.

---



2,773,391
**REELING DISTRIBUTOR**
Carl O. Brunelle, Metuchen, N. J., assignor to Syncro Machine Company, Perth Amboy, N. J., a corporation of New Jersey
Application August 24, 1955, Serial No. 530,247
8 Claims. (Cl. 74—89)

1. In a traversing mechanism of the type described a rotatably supported lead-screw shaft, means forming a guideway, a carriage movable on said guideway means and a driving connection between said shaft and carriage in combination with means for rotating said shaft in either direction comprising a power driven wobble plate, a pair of oppositely acting clutches having a driving connection with said shaft and means for selectively connecting said clutches to said wobble plate.

---

2,773,392
**POWER TRANSMISSION**
George J. Clark, Chester, Iowa
Application June 29, 1953, Serial No. 364,669
6 Claims. (Cl. 74—269)

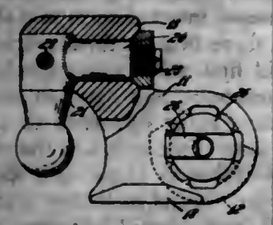
1. In a transmission, a frame, an input shaft supported by said frame, an output shaft supported by said frame, said shafts being movable toward and away from each other over a range of spacings, there being a first spacing at which a first driving means interconnects said shafts in a first driving relation, there being a second spacing of said shafts, smaller than said first spacing, at which a second driving means interconnects said shafts in a second driving relation, there being a third spacing of said shafts, intermediate said first and second spacings, where there is no driving interconnection between said shafts, one of said driving means being operative to cause said shafts to rotate in the same directions and the other said driving means being operative to cause said shafts to rotate in opposite directions, means including a toggle linkage for maintaining said shafts at said first spaced relation, means including a single spring so positioned and arranged and gravity operating opposite to said spring for maintaining said shafts at said third spacing, and means including a control member for overcoming the bias of said spring to adjust the spacing of said shafts to said second spacing.

---

2,773,393
**VARIABLE PITCH SHEAVES**
David Firth, South Bend, Ind., assignor to Dodge Manufacturing Corporation, Mishawaka, Ind., a corporation of Indiana
Application June 8, 1954, Serial No. 435,182
6 Claims. (Cl. 74—230.17)

1. A variable pitch sheave comprising a pair of confronting annular discs having conical faces for engaging an interposed V-belt, an exteriorly cylindrical hub on which said discs are slidably fitted, an adjusting screw

parallel with the hub and so arranged that an imaginary cylindrical surface coincident with the exterior surface of the hub intersects the screw, said screw having axially spaced threaded portions of opposite hands and an intermediate portion of smaller diameter than that of said threaded portions, said hub having axially spaced recesses accommodating said threaded portions of the screw and having a longitudinal groove connecting said recesses and accommodating said intermediate portion of the screw, said hub having means for holding the screw from axial displacement, said discs having in their inner peripheries longitudinal grooves with tapped walls into which said threaded portions of the screw are screwed, said tapped walls of said grooves providing segments of screw threads respectively matching and interengaged with the threads of said threaded portions of the screw, the discs being simultaneously shiftable axially in opposite directions by rotating the screw, the hub being split longitudinally and expansible to grip the discs.



---

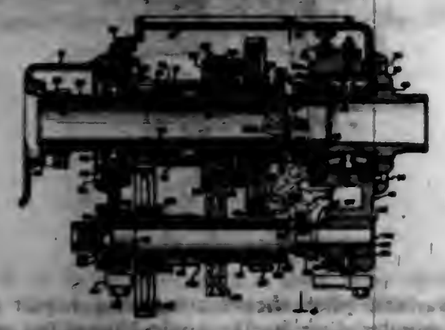
2,773,394

## TOOL CARRYING CHAINS FOR USE ON COAL CUTTERS AND THE LIKE

Sidney Ernest Procter, Aylesbury, England, assignor to Austin Hoy and Company Limited, Aylesbury, England, a British company

Application December 28, 1954, Serial No. 478,002
Claims priority, application Great Britain June 10, 1954
6 Claims. (Cl. 74—246)

1. A tool carrying chain having links which compriaes body-portions, sockets at one end of said body-portions adapted to receive balls of neighboring links, tool-carrying bosses disposed on said links and balls below said bosses adapted to fit into said sockets, said balls being formed on stems having shanks extending at an angle to said stems, the tool-carrying bosses being bored parallel to the length of the chain to receive said shanks, and means being provided to hold the shanks in the bosses, said bosses being shaped to fit the stem-portions of said balls whereby said shanks are prevented from turning in the bores of said bosses.



---

2,773,395

## POWER TRANSMISSION MECHANISMS

Eric A. Rellig, Milwaukee, Wis., assignor to Rockwell Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania

Application November 7, 1952, Serial No. 319,243
14 Claims. (Cl. 74—333)

1. In a machine tool having a rotatable spindle, a driving element rotatably mounted on said spindle and fixed against axial movement thereon, a first gear on said spindle mounted for rotation with said driving element, a second gear non-rotatably mounted on said spindle for axial movement thereon, cooperating clutch means on said element and said second gear for establishing a driving connection therebetween, a gear train adapted to drivingly connect said first and second gears, and manual means associated with said second gear and said gear train for selectively controlling the operative connection between said gear train, said driving element and said second gear, and for selectively axially moving said second gear for controlling engagement of said clutch means to connect and disconnect said second gear and said driving element.

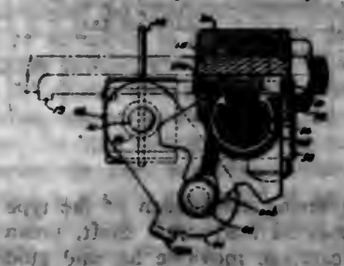
## POWER STEERING MECHANISM

Alex L. Haynes and Cecil E. Rawdon, Detroit, and Warren A. Van Wicklin, Jr., Dearborn, Mich., assignors to Ford Motor Company, Dearborn, Mich., a corporation of Delaware

Application June 15, 1955, Serial No. 515,734
8 Claims. (Cl. 74—388)

1. In a steering gear mechanism, a steering gear housing, a steering gear member rotatably mounted in said housing and having a bore formed therein, a torsion bar extending freely through the bore in said steering gear member and nonrotatably anchored at one end to said member, a manually operable member operably connected to said torsion bar at a point spaced from the anchored end thereof, a threaded part on said torsion bar, said part being axially spaced from the anchored end of said torsion bar, a second threaded part threadedly engaging said first threaded part and mounted for axially slidable and nonrotatable movement relative to said steering gear member so that torsional distortion of said torsion bar under load produces relative rotation between said parts and effects axial movement of said second part, a valve spool associated with said second threaded part, a hydraulic servo unit, a hydraulic power source, and means interconnecting said power source, valve spool and servo unit to enable said servo unit to be controlled by said axially movable valve spool.



---

2,773,397

## TRANSMISSION SHIPPER OPERATING DEVICE

Alvin P. Douglas, Cleveland Heights, Ohio, assignor to The Murray-Ohio Manufacturing Company, Cleveland, Ohio, a corporation of Ohio

Application June 25, 1953, Serial No. 364,156
4 Claims. (Cl. 74—473)

1. A shipper mechanism for a multi-speed bicycle transmission adapted to be keyed to and carried by the rear non-rotating axle of a bicycle, a non-rotating bicycle rear axle having an axially extending keyway, a bracket carried by the axle, a key member extending between the bracket and the axle to non-rotatably fix the bracket on the axle, said bracket having a depending bearing sleeve, a shaft supported by the sleeve, a rockable lever secured to the shaft adjacent the lower end of the sleeve, a detent segment fixed on the lower end of the bearing sleeve of the bracket, a yieldable detent lever pivotally mounted on the rocker lever operable with the fixed detent segment and the upper end of said shaft being adapted to operate a shipper member when rocked by said rockable lever.

---

2,773,398

## TRANSMISSION CONTROL AND GUARD

Norman R. Swain, San Leandro, Calif.

Application April 27, 1953, Serial No. 351,135
10 Claims. (Cl. 74—473)

1. In a bicycle or the like, a frame, an axle extending through and between the sides of a fork portion of the frame and having a tubular end portion, a drive wheel having its hub mounted on the axle between the fork portions of the frame and provided with change-speed mechanism controlled by a flexible line extending through and from the bore of the tubular end portion of the axle, a nut mounted on the extending tubular portion of the axle and fixing the axle to the frame thereat and extending outwardly beyond the axle extremity to provide an extension of the axle bore receiving the flexible line longitudinally through its bore and radially from its extremity in direct sliding contact with its annular outer end face to provide a bend in the pull member thereat, and a guard member mounted on the extending nut portion and cooperative therewith to laterally enclose the pull line bend at the outer nut extremity.

---

2,773,399

## STEERING COLUMN TRANSMISSION CONTROL MECHANISM

Harry R. Stocks, Greenways, Whipsnade, Dunstable, and Thomas C. F. Stott and Frank Westcott, Harpenden, England, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application February 2, 1955, Serial No. 485,646
Claims priority, application Great Britain
February 24, 1954
24 Claims. (Cl. 74—484)

1. A steering column transmission control mechanism for a motor vehicle comprising a steering shaft, a fixed support for said steering shaft, a transmission control rod reciprocably and rotatably mounted on an axis alongside said steering shaft and having an upper and a lower end, a ring secured to said upper end of said transmission control rod and surrounding said steering shaft, a hand lever, a universal mounting intermediate the ends of said lever on said fixed support about a pivot point on said axis of said rod, and a pivotal connection between one end of said lever and said ring, the pivotal axis of said connection being in a plane perpendicular to said axis of said rod and tangential to a circle about said pivot point.

---

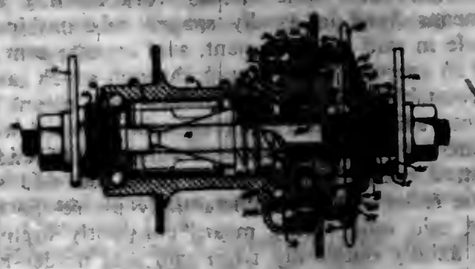
2,773,400

## BEARING STRUCTURE

Jakob Saiger, Geppingen, Germany, assignor to L. Schuler A. G., Geppingen, Germany

Application May 8, 1953, Serial No. 353,784
Claims priority, application Germany May 9, 1952
2 Claims. (Cl. 74—595)

1. Bearing structure for the drive shaft of machine tools subject to working pressure in a direction transverse to the shaft, comprising a drive shaft, a connecting rod journalled on the shaft, a pair of stationary bearings in which said shaft is supported at spaced locations, at least one movable auxiliary roller bearing connected to said shaft, and energy storing means connected to and acting on said auxiliary roller bearing in the same direction as the working pressure to urge said shaft into journal contact in said stationary bearings even when the working pressure is not present.



---

2,773,401

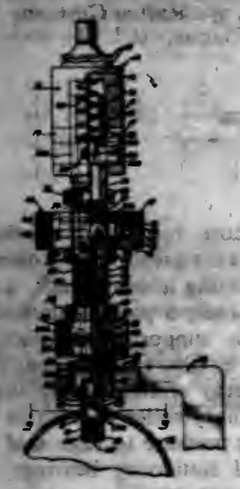
## TWO SPEED BICYCLE TRANSMISSION

Alvin P. Douglas, Cleveland, Ohio, assignor to The Murray Ohio Manufacturing Company, Cleveland, Ohio, a corporation of Ohio

Application December 10, 1954, Serial No. 474,411
4 Claims. (Cl. 74—781)

1. In a two speed planetary gear transmission for a sprocket driven rear wheel in a bicycle, a bicycle rear axle, an axle mounted rear hub structure, a cupped spoke anchor member attached to the hub inwardly of the sprocket end of the hub thereby to provide an external bearing support on the hub end, a planet carrier disposed within the cupped formation of the hub having a circumferential rim thereof overhanging the external bearing support on the hub end to be supported thereby, said planet carrier having a free wheeling connection with the hub, a driving sprocket, a sprocket carrying sleeve constituting a ring gear within said cup shaped anchor member and extending inwardly to overhang the circumference of the planet carrier thereby to afford a bearing on the planet carrier for the inner end of the sleeve adjacent the external bearing between the planet carrier and the hub end, a sun gear bearing on the sprocket sleeve, an adjustable bearing member for the sun gear mounted on the axle, planet gears on the carrier meshing wtih the sun gear and an axially shiftable plate operable within the sprocket carrying sleeve and having locking pins for locking the sun gear bearing plate and the carrier together at an in-

ward position of the plate and means on the plate engageable with the adjustable bearing member for causing the plate to lock the sun gear to said adjustable bearing member upon an outward shifting of the plate.



---

2,773,462

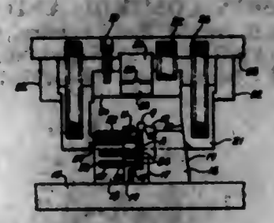
## MEANS FOR FORM CUTTING STRUCTURE AT THE PERIPHERIES OF ROUND HOLES IN CURVED ELEMENTS

Ralph A. Edens, Grosse Pointe Woods, Mich., assignor to Falcon Tool Company, a corporation of Michigan

Application November 12, 1954, Serial No. 468,336
2 Claims. (Cl. 77—58)

1. Means for form cutting structure at the peripheries of round holes in curved work elements comprising, in combination, a tool holder, a spindle reciprocably mounted in said tool holder and turnable thereby, a radially disposed cutting tool diametrically slidable in said spindle at the lower end thereof, cam means movable axially within said spindle engaging said cutting tool to advance and retract said cutting tool radially against the periphery of a hole in said work element, arcuate cam means fixed in axially spaced relationship above said hole in said work element, said arcuate cam means having an aperture therethrough through which said spindle is rotatably disposed, said arcuate cam means having the same radius as said work element disposed with the curvature thereof parallel to the curvature of said work element, a roller cam follower keyed on said spindle with the roller disposed substantially above the cutting edge of said tool, spring means constantly urging said spindle axially outwardly from said tool holder causing said roller cam follower to follow said arcuate cam, and means for advancing said first mentioned cam against said cutting tool to move said cutting tool into cutting engagement with the structure at the periphery of said round hole in said work element as the spindle reciprocates responsive to rotation of the tool holder and the action of the roller cam follower against said arcuate cam.

---



2,773,463

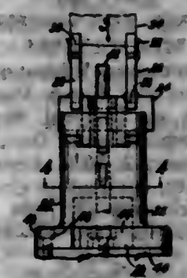
## PRESS WITH AUTOMATIC KICK-OUT MECHANISM

Roy E. McCleary, Rockford, Ill., assignor to Atwood Vacuum Machine Company, Rockford, Ill., a corporation of Illinois

Application June 17, 1953, Serial No. 362,253
12 Claims. (Cl. 78—17)

12. In a press comprising a bolster and a ram reciprocable toward and away from the bolster, the combination with lower die sections carried on the bolster, and a punch to cooperate therewith carried on the ram, of a kick-out shoe movable between the lower die sections when they are separated and arranged to strike and eject a blank disposed between said die sections, a drift pin guided for reciprocation laterally relative to one of said lower die sections and engageable with the blank to move it and the companion lower die section laterally toward a retracted open die position wherein the blank is in the path of movement of the kick-out shoe for ejection thereby, spring-pressed pins also guided for reciprocation laterally relative to the same lower die section as the drift pin and engaging the blank to help move it and the companion lower die section laterally toward the retracted open die position, said spring-pressed pins being extensible farther than the drift pin to open the dies fully and position the blank for ejection, a manually operable hand lever swingable relative to said bolster and engageable with one of the lower

die sections to move it partway toward closed position after a blank to be operated upon is inserted between the die sections, a control device controlling operation of the ram operable by said lever when it has moved the die section a predetermined distance, another means movable with the ram arranged to operate said drift pin in the upstroke of the ram to open said lower die sections, an air cylinder having a piston reciprocable therein and movable forwardly under air pressure, spring means returning said piston, means connecting said piston to said shoe for reciprocation of the latter, an air valve controlling the delivery of air to said cylinder from a source of compressed air, and means for opening said valve momentarily in timed relation to the opening of said die sections.



---

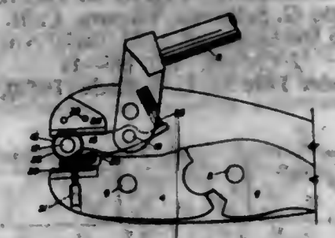
2,773,464

## METAL WORKING APPARATUS

Charles A. Nichols, Anderson, George L. Weiser, Middletown, and Robert W. Ewald, Anderson, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application August 20, 1952, Serial No. 305,474
5 Claims. (Cl. 80—26)

1. A workholder for use in connection with gap rolls comprising in combination, a standard, a workholder rotatably supported upon said standard, and including a split flange having clearance between the two portions of said flange, one of said portions being immovably secured to the standard and the other of said flanges being immovably secured to the workholder and being capable of limited rotation with respect to the standard, locking means in connection with the second mentioned flange for locking the flange in any given position to the standard and adjustment means in connection with the first flange for adjusting the second flange with respect thereto, and means for yieldably gripping a workpiece on said workholder.



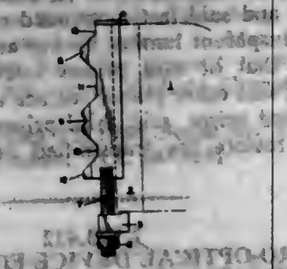
2,773,465

## TOOL AND METHOD FOR COMPRESSION SPLICING OF WIRES AND CABLES

Thomas A. Sanders and Frank Kaim, Philadelphia, Pa.

Application April 30, 1953, Serial No. 352,106
6 Claims. (Cl. 81—15)

1. A tool for splicing electrical conductors or the like disposed in parallel lapped relation within an enclosing ductile metal sleeve of generally oblong transverse shape by impressing a transverse indentation in said sleeve and conductors comprising a reciprocable roller, a lever connected with the roller for reciprocating it, a body supporting the lever, a jaw associated with the body for movement toward and away from the path of the roller, an anvil on the jaw proximate said path, and a second lever carried by the body and cooperative with the jaw to move the latter toward and away from said path, the transverse space on both sides of said anvil being unobstructed.



---

2,773,466

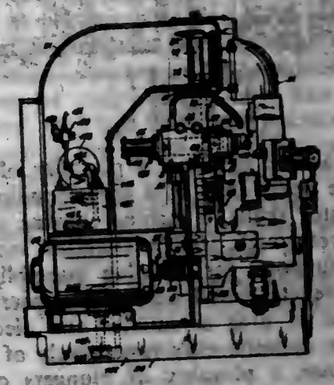
## AUXILIARY JAWS FOR VISES

Wilhelm Dechsner, Deutsch-Wagram, Austria

Application November 23, 1953, Serial No. 393,861
1 Claim. (Cl. 81—39)

An auxiliary jaw for a conventional vise jaw, said auxiliary jaw comprising a body having a plate integrally secured to an end thereof for engaging a corresponding end of such a vise jaw, a threaded stud extending into and secured at the other end of said auxiliary jaw body, a clamp member movably guided on said threaded stud for engaging an opposite side of such a vise jaw, and a nut on said threaded stud for exerting pressure on said clamp member whereby said auxiliary jaw body may be rigidly fastened to a conventional vise jaw.

---



2,773,467

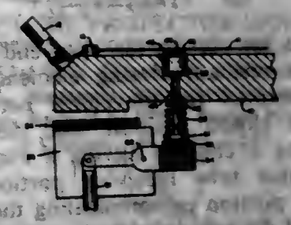
## TURNING MACHINE

Otis E. Staples, Euclid, Ohio, assignor to The Cleveland Hobbing Machine Company, Euclid, Ohio, a corporation of Ohio

Application June 30, 1951, Serial No. 234,608
2 Claims. (Cl. 82—14)

1. In a machine tool of the character described, the combination of a vertically extending stationary frame member, a second frame member mounted for vertical sliding movement on the first-mentioned frame member, a work spindle rotatably mounted on said second frame member, a work holding means carried by said spindle, a tool support movably mounted upon said stationary frame members for sliding movement transversely of said spindle and adapted to support a non-rotatable turning tool, means for urging said tool support towards said spindle to bring the turning tool into machining relationship with a workpiece carried by said work holding means, linearly movable cam means having a configuration determinative of the final shape of the workpiece, means supporting said cam means on said second frame member and cooperating with said tool support to regulate the position of the support relative to the spindle, means for effecting vertical movement of said second frame member, means to rotate said spindle so that a tool on said tool support sequentially turns a workpiece

supported on said spindle to the shape determined by the configuration of said cam means, a second tool support carried by said second frame member, means to move said second tool support transversely relative to said spindle so that a tool on said second tool support effects a machining operation upon the workpiece, and means responsive to movement of said second frame member to a predetermined upper position thereof to effect movement of the first-mentioned tool support away from the workpiece and the second tool support towards said workpiece whereby a tool on the second tool support is operative to effect a machining operation only after the tool on the first-mentioned tool support has completed its machining operation.



---

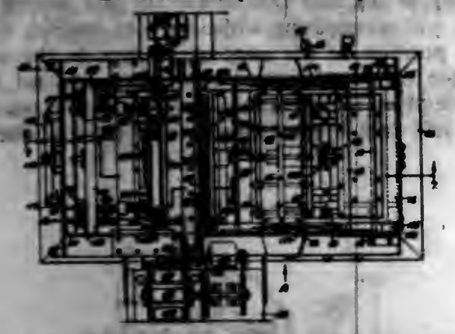
2,773,468

## DAMPER FOR MUSICAL INSTRUMENTS

Joseph F. Dvorak, Deer Park, Ohio, assignor of one-third to Ferdinand Machalek and one-third to Joseph Litschaleb, Cincinnati, Ohio

Application March 7, 1955, Serial No. 492,624
9 Claims. (Cl. 84—217)

1. A device for silencing the string of a musical instrument comprising a depressible key, a string mounted on said key and extending longitudinally thereof, means for exciting said string into vibration when said key is depressed, and means for silencing said string when the key is released including a damper mounted on said key beneath said string for movement into and out of contact with said string, means normally biasing said damper out of contact with said string, and means for moving said damper into contact with said string when the key returns to its undepressed position.

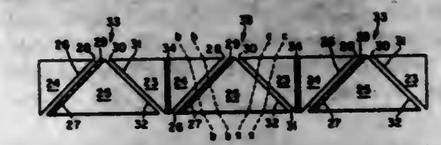


2,773,415

## APPARATUS FOR QUANTITATIVE

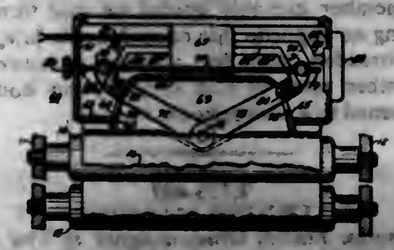
light reflected from the material and issuing out of the

2,773,409
**MULTIPLE ASSEMBLING MACHINE FOR ELECTRIC BLASTING INITIATORS**
Daniel D. Hayett, Wilmington, Del., assignor to Atlas Powder Company, Wilmington, Del., a corporation of Delaware
Application October 2, 1951, Serial No. 249,298
27 Claims. (Cl. 86—10)



4. In a machine to insert a plurality of plug assemblies into the open ends of a corresponding number of electric initiator shells, a member having a plurality of openings therethrough, feed mechanisms including a pair of movable supports for the plug assemblies and shells operable in predetermined sequence to insert corresponding pluralities of plug assemblies and electric initiator shells into the opposite ends respectively of the openings in said member, a plurality of plungers corresponding in number to the plug assemblies normally offset with respect to the axes of the plug assemblies and member openings, a support for said plungers, cam means engageable with said plunger support operable to position said plungers simultaneously with their axes coincident with the axes of said plug assemblies, and a member movable with the cam means to initiate actuation of the plungers as a group in an axial direction to engage the plug assemblies and force the same axially into the open ends of said shells.

2,773,410
**MACHINE AND METHOD FOR THE PRODUCTION OF BLASTING DETONATORS AND IMPROVED BLASTING DETONATORS**
Phillip C. Bishop, Saltcoats, Scotland, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
Application May 22, 1951, Serial No. 227,574
Claims priority, application Great Britain June 2, 1950
3 Claims. (Cl. 86—39)

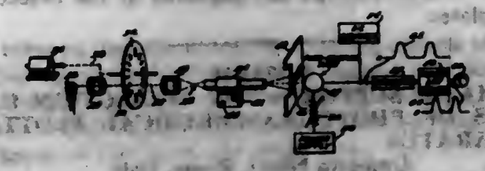


1. Apparatus for closing the open end of a detonator tube around a resilient closing element comprising a divided die mounted for movement between an open position and a closed position, said die in its closed position defining a channel having a longitudinally extending detonator tube receiving portion and an inwardly tapered portion communicating therewith, means for moving said die into its closed position, means movable through an operative path for effecting a relative longitudinal movement between said die and a detonator tube positioned adjacent thereto, means operatively associated with said relative movement effecting means and said die closing means for actuating the latter to close said die in response to the initial movement of said relative movement effecting means through said operative path, said relative movement effecting means being operable upon further movement through said operative path to effect an interengaging relative longitudinal movement between the inwardly tapered portion of said die channel and the open end of the detonator tube so as to deform the latter inwardly into engagement with a resilient closing element disposed therein.

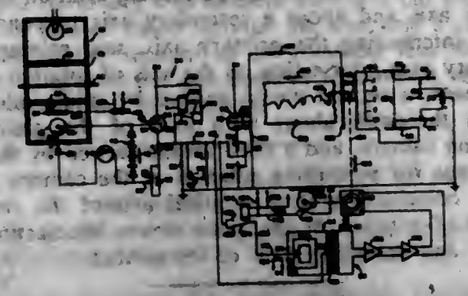
2,773,411
**ANGULAR DISCRIMINATING OPTICAL DEVICE**
Otto G. Schwede, Ventura, Calif.
Application December 30, 1955, Serial No. 556,756
2 Claims. (Cl. 88—1)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. An optical unit which comprises first and second transparent prisms each having an entrance face in a common plane and a planar surface disposed at an acute angle to each of said entrance faces such that a portion of the light rays entering the entrance face is totally reflected and a portion of said rays is transmitted by said planar surface depending on their angle of incidence, each of said first and second prisms having a third surface connecting corresponding ends of said entrance faces and said planar surfaces thereof, a third transparent prism having two entrance faces each positioned parallel to a separate one of said planar surfaces and having an emergent face parallel to and spaced from the entrance faces of said first and second prisms, an optical double layer disposed between one of said planar surfaces and the adjacent entrance face of said third prism, said double layer comprising a light filter in contact with said last mentioned entrance face and a transparent lamina having an index of refraction less than that of said prisms adjacent to and in continuous contact with said filter and said last mentioned planar surface, and a second transparent lamina having an index of refraction less than that of said prisms interposed between and contacting said other planar surface and the adjacent face of said third prism, said third prism functioning to substantially restore the transmitted rays to their original direction.

2,773,412
**ELECTRO-OPTICAL DEVICE FOR MEASURING THICKNESSES OF COATINGS ON MATERIALS**
William F. Huck, Forest Hills, N. Y., assignor to Hack Company, New York, N. Y., a partnership of New York
Application April 16, 1953, Serial No. 349,151
2 Claims. (Cl. 88—14)



1. In a device for measuring the thickness of a transparent coating upon the surface of a material, said device including a casing arranged in operative proximity to the coating on the said material, a member arranged in the casing, said member being translationally movable and turnably mounted in the casing, a pair of links swingably associated with and movable by the member, said links having end portions protruded exteriorly of the casing, a source of light secured to one of the links and projecting light through the coating and onto the material, a photoelectric cell secured to the other of the links and receiving



light reflected from the material and issuing out of the coating, and indicating means mounted on the casing and electrically connected to the photo-electric cell; whereby the thickness of a transparent coating on a material may be indicated by said indicating means.

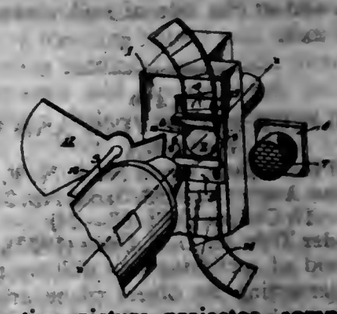
2,773,413
**APPARATUS FOR AND METHOD OF MEASURING THE QUALITY OF OPTICAL DEVICES**
Otto H. Schade, Sr., West Caldwell, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application April 1, 1955, Serial No. 498,682
9 Claims. (Cl. 88—14)

1. Apparatus for measuring the optical equivalent passband $N_e$ of an optical device comprising means for cooperating with said device to form a plurality of successive line-images, means to convert said line-images into a first series of uniformly spaced electrical impulses, means to derive from said first series of electrical impulses a second series of electrical impulses having intensities equal to the square of said first series, and means to measure said second series of electrical impulses.

2,773,414
**DIRECT READING INTENSITY PHOTOGRAPHIC PHOTOMETER**
Milton Green, Little Silver, N. J., assignor of twelve and one-half percent to David M. Greenberg, Berkeley, Calif., twelve and one-half percent to Max M. Greenberg, New Orleans, La., five percent to Mrs. Jessie Spoken, and five percent to William Greenberg, both of Pueblo, Colo.
Application February 18, 1954, Serial No. 411,175
14 Claims. (Cl. 88—14)

1. A photographic photometer comprising means responsive to the light transmittance of a medium of predetermined density to provide a signal proportional to the logarithm of said light transmittance, a thermionic tube circuit having parameters to provide a current output curve which corresponds to the density versus logarithm of intensity of exposure photographic curve, said tube having a variable voltage source connected to its input circuit to provide signal output therefrom, means operable in response to the difference between said first mentioned signal and said signal output to vary the voltage applied to said input circuit to equalize the signal output from said tube with said first mentioned signal, whereby the magnitude of said applied voltage is proportional to the logarithm of the intensity of the light which produced the density of said medium.

2,773,415
**METHOD AND APPARATUS FOR QUANTITATIVE SPECTRAL ANALYSIS**
John John Wolfe, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application January 26, 1955, Serial No. 484,263
16 Claims. (Cl. 88—14)



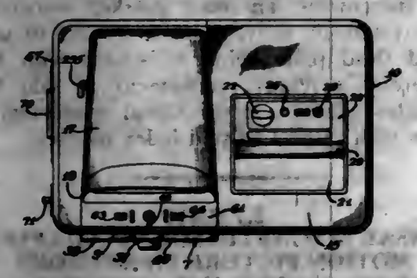
3. A computing device for use in spectrograph analysis comprising a first scale derived by projection on the log intensity axes of a curve obtained by relating a measurable function of photographic image intensity of an intensity graduated spectrum line recorded on a photographic plate of an element to the logarithm of the line intensity, a second scale derived in a like manner for another element, said first and second scales being movable with respect to one another, a third scale calibrated in linear increments, an index marker associated with and being relatively movable with respect to said third scale, said third scale being associated with said first scale whereby a relative movement of said first and second scales causes a proportional movement of said third scale with respect to said index marker.

2,773,416
**UNIVERSAL MAGNETIC SOUND ADAPTER FOR MOTION PICTURE PROJECTORS**
Ben Kleinerman, Flushing, N. Y., assignor, by mesne assignments, to Coastal Commercial Corporation, New York, N. Y., a corporation of New York
Application April 23, 1953, Serial No. 350,667
17 Claims. (Cl. 88—16.2)

1. The combination with a motion picture projector including a spindle normally adapted to support a film reel, of an adapter including a support, attachment means on said support for operative connection to said projector at said spindle, an auxiliary spindle on said support spaced from said attachment means for mounting said film reel, and transducing means on said support which the film traverses during operation of said projector.

2,773,417
**MOTION PICTURE PROJECTOR HOUSING AND LIGHT CONDENSING MEANS**
Heinz Ulfers, Kiel-Wik, Germany, assignor to Zeiss Ikon, A. G., Stuttgart, Stuttgart, Germany
Application August 6, 1953, Serial No. 372,785
3 Claims. (Cl. 88—24)

1. In a motion picture projector, comprising a lamp casing and projecting head having a projection aperture



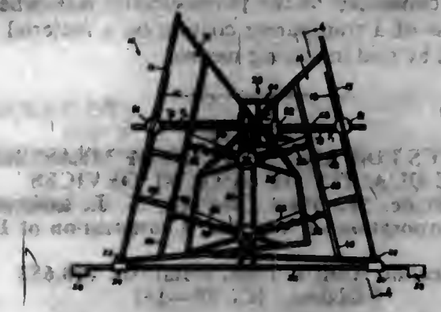
able mark with the rays from the plate, the rays emerging

2,773,424

therein, said lamp casing and projecting head being arranged independently one from the other in operative optical alinement, and a removable and insertable honeycomb condenser collimating unit supported by the projection head between the projection head and aperture for uniformly illuminating the projection aperture, means on said projection head for supporting said honeycomb condenser collimating unit and arranged in front of the lamp casing, said condenser unit being supported by the projecting head and arranged in front of the projection aperture looking into the direction of the light rays from the lamp casing.

---

2,773,418
**PHOTOGRAPHIC COPYING AND VIEWING APPARATUS**
Thomas R. Perezutka, Niles, and Stuart C. Plattner, Evanston, Ill., assignors to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Application January 26, 1955, Serial No. 484,291
6 Claims. (Cl. 88—24)



1. In a combined copying and viewing apparatus, the combination of photographic copying means for progressively photographing records on a sensitized strip, viewing means for progressively viewing records on a record bearing strip, and said copying and viewing means being provided respectively with an exposure station and a projection station arranged in spaced opposite relation with and directed toward an axis and comprising two reflectors individual thereto and spaced longitudinally of said axis in the same direction from and directed toward said stations and displaced from each other perpendicularly to a plane of said axis normal to said stations, a reflector common to said copying and viewing means and arranged between said stations and inclined to said axis and directed toward said individual reflectors and adapted to alternately cooperate with said individual reflectors and stations in opposite positions thereof angularly about said axis, a mounting mounted for pivotal movement on said axis and carrying said common reflector for the selective positioning thereof in either of said positions, said common reflector being decentered from said axis perpendicularly to the plane of the angle of inclination of said common reflector to said axis for alternate cooperation of said common reflector with said individual reflectors in said different positions of said common reflector, and a light shield carried by said mounting and extending from said common reflector toward said individual reflectors in a plane parallel to said plane of said angle of inclination and at the side of said common reflector nearest to said axis.

---

2,773,419
**LOW OBLIQUE RECTIFYING AND RATIO CAMERA**
Sol Domenick, Great Neck, N. Y.
Application August 6, 1953, Serial No. 372,822
16 Claims. (Cl. 88—24)
(Granted under Title 35, U. S. Code (1952), sec. 266)

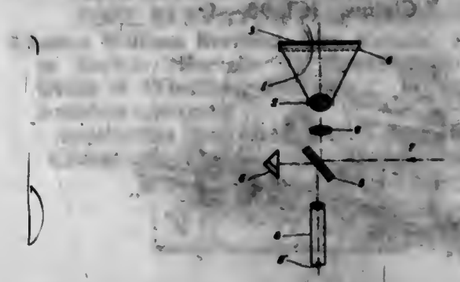
1. The method of rectifying low oblique photographs comprising, intersecting an object plane and an image plane at a remote line, intersecting the principal plane of a projection lens at the same remote line providing angular and translatory movement between object and image planes relative to each other, and referencing all

such movement through the isopoints of the object and image plates.

---

2,773,420
**KINEMATIC SUPPORTS FOR PROJECTION CAMERAS OF PHOTOGRAMMETRICAL PLOTTING APPARATUS**
Umberto Nistri, Rome, Italy
Application January 18, 1954, Serial No. 404,683
Claims priority, application Italy January 26, 1953
3 Claims. (Cl. 88—24)

1. In a projector for photogrammetric apparatus having a support permitting linear displacement about three orthogonal axes, the combination of a first means carried by said support for permitting rotation about a fixed axis parallel to one of the orthogonal axes, a gimbal carried by the first means for permitting rotation about a primary axis and about a secondary axis perpendicular to and intersecting the primary axis, said primary and secondary axes intersecting on the axis of rotation of the first means, a second means carried by said gimbal for rotation therewith about both axes of the gimbal, a projection camera, and a third means carried by the second means for permitting rotation of the camera about an axis coincident with the optical axis of the camera, the axis of rotation of the third means intersecting the primary and secondary axes of the gimbal.



---

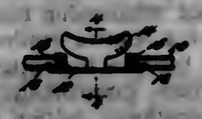
2,773,421
**PHOTOGRAMMETRIC PROJECTION PLOTTING DEVICES**
Umberto Nistri, Rome, Italy
Application January 18, 1954, Serial No. 404,681
Claims priority, application Italy August 19, 1953
5 Claims. (Cl. 88—24)

1. An optical system for use in a photogrammetric plotting system based on Porro's principle in which the objective of a plotting camera differs from the objective of a shooting camera, said system including a mount for a photogram plate, means for shifting the mount parallel to the optical axis of the objective of the plotting camera, the distance from the plate to the objective of the plotting camera thereby differing from the focal length of the objective of the plotting camera, a movable mark, a collimator for bringing the mark rays into parallelism, a movable mirror and prism for fusing the rays from the mov-

able mark with the rays from the plate, the rays emerging from the objective of the plotting camera being non-parallel due to the difference between the focal length and the distance from the plate to the objective of the plotting camera, whereby fusion is prevented and a lens unit lo-

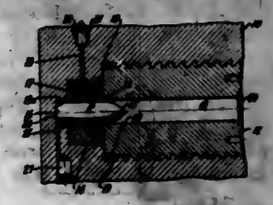
cated between the objective of the plotting camera and the movable mirror and prism and so shaped and disposed as to bring into exact parallelism the inclined rays issuing from the objective of the plotting camera thereby to obtain fusion of the mark and plate rays.

---



2,773,422
**POLARIZING UNIVERSAL SUN GLASSES**
William D. Flynn, Sr., Washington, D. C., and William D. Flynn, Jr., Morrow, Ga.
Application November 25, 1953, Serial No. 394,272
5 Claims. (Cl. 88—41)

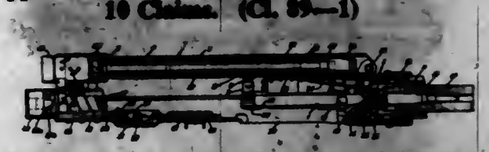
1. A sun glass comprising a frame, lens combinations supported by said frame, each lens combination embodying a stationary polarizing lens element and a superposed polarizing lens element rotatable on the stationary lens element regulating the passage of light through that part of the stationary lens element covered by one of said lens elements being colored, the other element being clear, said stationary lens element having a cut out portion in the line of vision through the lens, and a colored polarizing shutter secured to the rotatable lens element movable over said cut out portion, to cover a selected portion of said cut out portion.



---

2,773,423
**BRIDGE STRUCTURE**
Frank W. Lindblom, Warwick, R. I., assignor to Welsh Manufacturing Company, a corporation of Rhode Island
Application October 21, 1952, Serial No. 316,004
2 Claims. (Cl. 88—43)

1. In an ophthalmic mounting, a pair of eye wires each having a peripheral outwardly offset portion along its nasal edge, a bridge extending between said eyewires in front of the rims at said offset portions and of a width wider than said offset portion and covering said offset portions, arms attached to the outer ends of the bridge and of a width narrower than the bridge and the offset portions and extending rearwardly from the bridge and through said offset portion and embracing the same to secure the bridge and eyewires together.



2,773,424
**GUN PERFORATOR**
Thomas A. Andrew, Pasadena, Calif., assignor of one-fourth to Mordica O. Johnston, one-eighth to Mordica O. Johnston, Jr., and one-eighth to Warren C. Johnston, all of Glendale, Calif.
Application June 1, 1951, Serial No. 229,506
13 Claims. (Cl. 89—1)

12. In a casing perforator: a gun having a bore to receive a projectile, said bore having a portion of enlarged diameter adjacent its rear end, said enlargement constituting a propellent chamber, a projectile in said bore, said projectile bridging said propellent chamber when in its firing position, means forming a restricted passage from said propellent chamber to the gun bore in front of said projectile only when said projectile is in its firing position, means forming a restricted passageway communicating between said propellent chamber and the gun bore behind said projectile when said projectile is in its firing position, the ratio of the total volume of the last mentioned restricted passage and the space behind the projectile to the cross-sectional area of said restricted passage being greater than the ratio of the total volume of the forwardly directed restricted passageway and the space in front of the projectile to the cross-sectional area of the forwardly directed restricted passage whereby the pressure will initially build up faster in front of the projectile than in the rear thereof to restrain said projectile against movement until the pressure in front thereof exceeds the hydrostatic well pressure and clears the well fluids from the bore and whereby the pressure behind the projectile subsequently exceeds the pressure in front thereof and forces the projectile outwardly through the cleared bore, said projectile completely filling said bore after moving from its firing position to prevent further bypass of gases forwardly thereof.

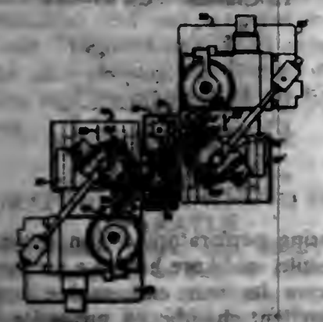
2,773,425
**GUN RELOADER**
Walter R. Weeks, Hamden, Conn., assignor to General Electric Company, a corporation of New York
Application July 19, 1945, Serial No. 605,971
10 Claims. (Cl. 89—1)

10. A reloader for an automatic gun provided with a reciprocating loading member, said reloader comprising a tubular reciprocating operating member arranged to be connected to the reciprocating loading member, a screw shaft extending through said reciprocating operating member, a traveling nut on said screw shaft engaging said operating member, an electric motor, a driving connection between said electric motor and said screw shaft comprising a shaft member connected to said motor and a tubular member surrounding said shaft member connected to said screw shaft, a helical spring having a portion encircling said shaft member and a portion inside said tubular member so that forward or reverse rotation of said motor tends to wind or unwind said spring to provide a predetermined limiting torque for said motor, and switching means for controlling said motor for forward or reverse rotation for operation of the reciprocating loading member.

2,773,426

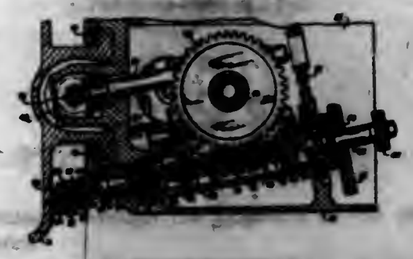


2,773,428

and then moving the cutter relative to the work in the

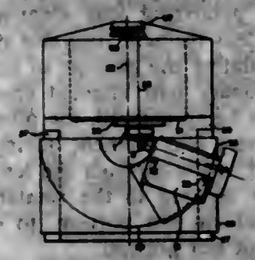
said support, the axial center of said disc-shaped hub

2,773,426
GEAR CUTTING MACHINE
Norman W. Fowler and Leonard C. Michelson, Brighton, N. Y., assignors to The Gleason Works, Rochester, N. Y., a corporation of New York
Application September 25, 1951, Serial No. 248,158
23 Claims. (Cl. 90—1)



1. In a gear cutting machine, first and second units each comprising a work spindle, means for cutting gear teeth on a work piece that is mounted on the spindle, and a carrier operable during each loading cycle to carry a work piece from the spindle to an unloading station and then to carry another work piece from a loading station to the work spindle; a transfer device for conveying work pieces from the unloading station of the first unit to the loading station of the second unit; sequence control means for each unit to cause the cutting means and the spindle of the unit to operate through a cutting cycle upon the completion of each loading cycle and the carrier of the unit to operate through a loading cycle upon the completion of each cutting cycle; and means controlled conjointly by both sequence control means for operating the transfer device while both carriers are away from their respective stations at the device.

2,773,427
HOBBING MACHINE
Thomas Barish, Washington, D. C., assignor to The Cleveland Hobbing Machine Company, Cleveland, Ohio, a corporation of Ohio
Application April 9, 1949, Serial No. 86,482
2 Claims. (Cl. 90—4)

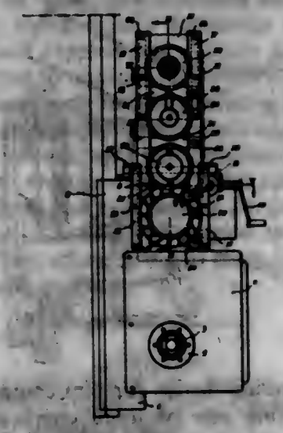


1. In a hob head for a hobbing machine, a hob arbor, means journalling said hob arbor for rotary and axial movements, driving means operatively connected with said hob arbor to rotate the same, a member rotatably supported concentrically with said hob arbor and having a threaded engagement with said hob arbor for rotation therewith and relative thereto, means preventing axial movement of said member, a first gear supported coaxially of said hob arbor and connected thereto for rotation therewith, a second gear of substantially the same diameter as said first gear supported coaxially of said hob arbor and connected to said member for rotation therewith, and a pair of gears having substantially the same diameter connected to rotate together about a common axis with the gears of said pair meshing respectively with said first and second gears, the diametral pitches of said pairs of connected gears being unequal while the meshing gears having the same diametral pitch.

2,773,428
HOBBING MACHINE
Edward J. Batorski, Chagrin Falls, Ohio, assignor to The Cleveland Hobbing Machine Company, Euclid, Ohio, a corporation of Ohio
Application July 10, 1953, Serial No. 367,183
7 Claims. (Cl. 90—4)

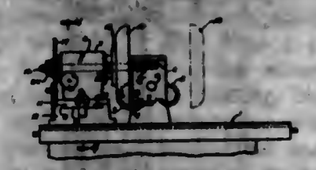
1. In a hobbing machine, a frame, a workhead movable with respect to said frame comprising a rotatable work spindle and a gear train for rotating said spindle, said gear train including a worm wheel and a worm gear in mesh therewith, an axially movable shaft for supporting said worm gear for axial movement while in mesh with said worm wheel, said shaft being rotatably supported in said workhead and extending outwardly therefrom, means for rotating said shaft, a cam mounted on said frame, a cam follower fixed to the outward end of said shaft and cooperating with said cam to impart axial movement to said shaft, and means yieldably urging said shaft axially toward said cam.

2,773,429
MACHINE AND METHOD FOR GENERATING TAPERED GEARS
Ernest Wildhaber, Brighton, N. Y., assignor to The Gleason Works, Rochester, N. Y., a corporation of New York
Application July 12, 1952, Serial No. 298,544
19 Claims. (Cl. 90—5)

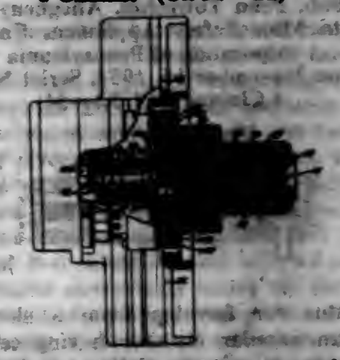


1. A machine for generating tapered gears comprising a spindle for a rotary cutter, a work spindle, a cradle on which one spindle is mounted, means for rotating the cutter spindle, drive means for rotating the cradle and in time therewith rotating the work spindle to cause the rotating cutter to effect tooth profile generation, and means for oscillating one spindle relative to the other, in a direction depthwise of the teeth being cut, the last-mentioned means being connected to the drive means to operate in such timed relationship therewith that during gear tooth generation a relative depthwise motion in one direction is effected between the cutter and the work as the generation proceeds approximately to its mid-point and that a relative depthwise motion in the opposite direction is effected as the generation proceeds beyond said point.

12. The method of generating a tapered gear with a rotating cutter, by relative motions of work and the cutter respectively about the axis of the work and about the axis of an imaginary gear represented by the cutter, comprising moving the cutter relative to the work in one direction depthwise of the teeth being cut as the tooth surface generation effected by said relative motions about said axes proceeds toward approximately its mid-point and then moving the cutter relative to the work in the opposite direction as the generation continues beyond said point.

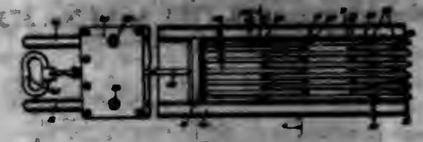


2,773,430
TOOL ELEVATOR FOR MACHINE TOOL
Charles William Berthier, Bizy Vernon, France, assignor to Societe Nouvelle de Construction de Machines-Outils et d'Outillage Precedes C. W. B., Paris, France, a societe anonyme
Application December 3, 1951, Serial No. 260,075
Claims priority, application France January 4, 1951
3 Claims. (Cl. 90—11)



1. A device for transporting an object to be mounted on a supporting member from an inoperative position to an operative position with reference to an axis fixed with respect to said supporting member, said device comprising an element adapted to be mounted on said supporting member, a member carrying a linear trackway, means mounting said trackway member on said element so that said trackway extends transversely of said fixed axis and said trackway member has limited movement in the direction along said fixed axis, a carriage mounted on said trackway member for movement of said carriage along said trackway, means carried by said carriage for supporting said object on said carriage, and means operatively connected to said trackway member and to said carriage and operable for moving said carriage along said trackway between positions in which said object respectively is in said inoperative and said operative positions.

2,773,431
MILLING MACHINE
Earl A. Thompson, Ferndale, Mich.
Application July 23, 1951, Serial No. 238,050
6 Claims. (Cl. 90—18)



1. In a milling machine, a support, a disc-shaped hub arranged on said support with a portion of said hub overlapping said support and with the remaining portion of said hub projecting outwardly beyond the periphery of said support, means fixedly connecting said overlapping portion of said hub with the adjacent portion of said support, a milling cutter in the form of an annulus journalled on said disc-shaped hub, the portion of said disc-shaped hub projecting outwardly beyond the periphery of said support having a thickness no greater than the width of said milling cutter whereby said milling cutter is capable of milling to a depth equal to the distance between the outermost portion of said cutter and the periphery of said support, the axial center of said disc-shaped hub being disposed on that portion of the sub which projects outwardly beyond the periphery of said support.

2,773,432
MACHINE FOR FORMING PREDETERMINED IRREGULAR SURFACES
Charles B. De Vleg, Farmington, Howard R. De Vleg, Grosse Pointe Woods, and Charles R. De Vleg, Birmingham, Mich., assignors to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Original application May 16, 1947, Serial No. 748,282, now Patent No. 2,660,930, dated December 1, 1953. Divided and this application October 9, 1953, Serial No. 385,099
8 Claims. (Cl. 90—22)

1. In a metal working machine, a work head comprising a housing, a spindle mounted for rotational and axial movement and having an annular gear at one end, a lead screw for controlling the axial movement of said spindle, a shaft having a gear thereon and arranged to drive said lead screw, an anti-backlash nut disposed between said spindle and said lead screw for preventing relative axial movement between the spindle and the lead screw, and opposed pairs of gear trains disposed between said annular gear on the spindle and said gear on the shaft for effecting rotational motion of said spindle in a predetermined timed relation with the axial movement of the spindle.

2,773,433
SUCTION BOX HAVING ROLLER FACE
Ernest A. R. Mathias, Newport, England, assignor of one-half to Alfred Robertson, London, England
Application December 11, 1952, Serial No. 325,496
Claims priority, application Great Britain December 13, 1951
3 Claims. (Cl. 92—51)

1. A suction box for applying a reduced pressure to a web of material comprising a box-like frame, a series of rollers disposed across the upper part of the box-like frame in parallel lines transverse to the direction of movement of the web, each line of rollers extending substantially completely across the frame, adjacent ends of rollers in each line being bridged by a roller in the next line, said rollers having end spindles thereon of less diameter than the rollers, said spindles being separate from those of other rollers so that each roller can rotate independently of the other rollers, said frame being adapted to be maintained under reduced pressure, at least five of said rollers being provided in each transverse line, said rollers having a diameter of between three eighths of an inch up two inches, the uppermost parts of the rollers being in the same plane as the sides of the box-like

frame, a plurality of bearings for the roller spindles be-

body of the bag to leave an upstanding fin running trans-

frame, a plurality of bearings for the roller spindles between the ends of each line, said bearings carrying said spindles in a freely rotatable manner, said bearings being supported only by means located below the rollers, slidably adjustable bearings for alternate rollers at the ends of the lines, upper and lower sealing strips carried by said adjustable bearings and extending across the frame, means for closing said end portions of the frame in the region of said last mentioned bearings but having the central portion of the frame open, and means for lubricating said bearings.

---

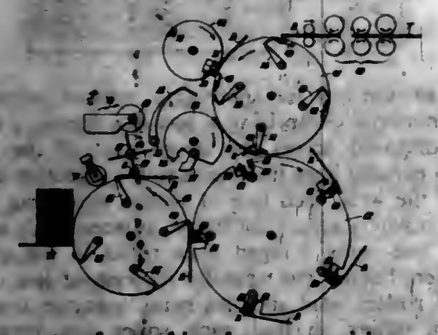
2,773,434

## APPARATUS FOR FORMING FIBROUS ANNULAR MEMBERS

Robert A. Bub, Penn Township, Allegheny County, Pa., assignor to Mine Safety Appliances Company, Pittsburgh, Pa., a corporation of Pennsylvania

Application November 16, 1954, Serial No. 469,253
4 Claims. (Cl. 92—54)

1. Apparatus for forming from a slurry of fibers and water an annular member having several smooth sides, comprising a pair of axially spaced rings provided with opposed annular recesses each having radially spaced inner and outer side walls, a pair of screens between the rings and extending across said recesses and walls, and means for holding the rings together, said screens being clamped between the walls at only one side of the recesses, the walls at the opposite side of the recesses being spaced much farther apart than the clamping walls, the screens in the recesses and between said spaced walls being spaced apart to form a radial chamber having only one side open, and said rings being provided with outlet openings adapted to be connected to a source of suction to draw slurry into said chamber through the open side, whereby water will be drawn through the screens and out of the rings and fibers will be trapped in the chamber to fill it and thereby form said annular member.



---

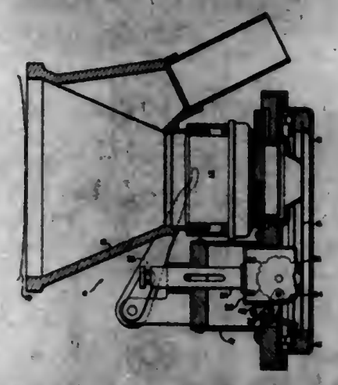
2,773,435

## CONTINUOUSLY OPERATING APPARATUS FOR MAKING BAGS

Arthur W. Richens, Chester County, Pa., assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application August 10, 1953, Serial No. 373,283
6 Claims. (Cl. 93—22)

1. Apparatus for making bags comprising: means for gripping a bag length of flattened gussetted tube, said means also being operative to open one end of said tube to form an open rectangular box having its bottom in the flattened body of the tube; positively acting means being operative to collapse said box like structure against the body of the bag to leave an upstanding fin running transverse the length of the tube; heated jaws receiving said upstanding fin and subjecting the same to heat and pressure; means operative thereafter for applying adhesive within the area of the fin and means operative thereafter for folding the fin against the body of the bag.



---

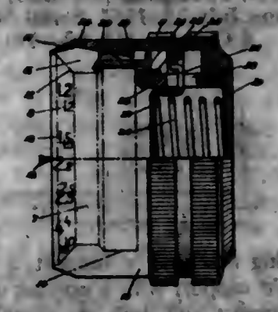
2,773,436

## PHOTOGRAPHIC FILM IDENTIFICATION

Edward G. Martin, Cambridge, Mass.

Application February 24, 1954, Serial No. 412,261
3 Claims. (Cl. 95—1.1)

1. An identification device for film comprising a marking member having one or more characters formed in radioactive material, an enclosure for the marking member to serve as a shield against radiation, the enclosure having an opening through which the marking member may be exposed, a cover shield member for said opening, a support for the enclosure, means for effecting relative movement of the enclosure with respect to the support to bring the marking member into immediate proximity with a film to be marked by direct radiation from the radioactive material on to the film, and means operated by said movement for moving the cover shield away from said opening.



---

2,773,437

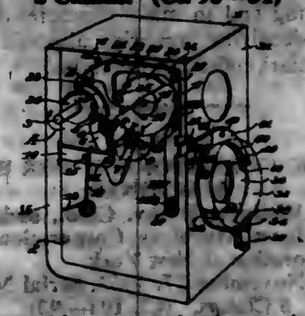
## SUPPLEMENTARY OPERATING KNOB FOR PHOTOGRAPHIC CAMERAS

Wilhelm Kaase, Braunschweig, Germany, assignor to Franke & Heidecke, Fabrik Photographischer Präzisions-Apparate, Braunschweig, Germany, a German firm

Application June 18, 1952, Serial No. 294,135
Claims priority, application Germany June 20, 1951
3 Claims. (Cl. 95—11)

1. A supplementary knob for an operating knob projecting from a wall of a photographic camera, comprising a hollow ring-like first portion for encircling the camera knob and having a rear end faced toward said camera wall and a front end away from said wall, said first portion having near its rear end an internal tapered part expanding toward said rear end and contracting toward said front end, a second portion constituting an end closure for the front end of said first portion and movable axially in said first portion, and a plurality of clamping members

extending approximately axially within said first portion in circumferentially spaced relation to each other, for clamping on a camera knob encircled by said first portion, said clamping members each having a front end operatively connected to said second portion to move axially therewith and having a hooklike rear end movable approximately radially inwardly and outwardly to clamping and unclamping positions with relation to the camera knob encircled by said first portion and also having near its rear end a contact surface for engaging said internal tapered part of said first portion, to move the hooklike rear ends of said clamping members radially inwardly to clamping position when said clamping members and said second portion move axially forwardly relative to said first portion, said supplementary knob in clamped position being adapted to transmit clockwise and counterclockwise turning movements to said operating knob, said front end of each of said clamping members including a projection extending toward said first portion, said projections being adapted to engage with said first portion when said clamping members and said second portion move axially rearwardly relative to said first portion to cause said rear ends of said clamping members to move radially outward to an unclamping position.



---

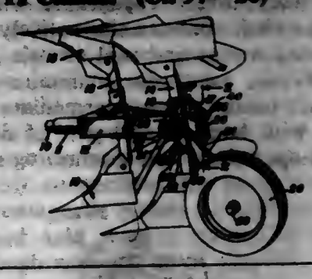
2,773,438

## PHOTOGRAPHIC CAMERA WITH INTERCONNECTED SHUTTER MECHANISM AND FILM WINDING MECHANISM

Hermann Brethauer and Gustav Bethmann, Braunschweig, Germany, assignors to Franke & Heidecke, Fabrik Photographischer Präzisions-Apparate, Braunschweig, Germany, a firm

Application January 30, 1953, Serial No. 334,304
Claims priority, application Germany January 31, 1952
2 Claims. (Cl. 95—31)

1. A photographic camera having a shutter and comprising an oscillatable member shiftable in a first direction to tension the shutter ready for operation and shiftable in a reverse direction to trip the tensioned shutter to make an exposure, film winding and metering means including a ratchet and a shiftable pawl movable from a disengaged position to a position engaging said ratchet to stop further winding of film after a predetermined length of film has been fed, spring means tending to move said pawl to its engaged position, blocking means engaging said oscillatable member and shiftable from a first position blocking said oscillatable member against movement in its said first direction to a second position in non-blocking relation to said oscillatable member, a shiftable link operatively connecting said pawl and said blocking means to each other to move said blocking means from its first position to its second position when said pawl moves from its disengaged position to its engaged position and to move said pawl from its engaged position to its disengaged position against the force of said spring means when said blocking means is moved from its second position to its first position, and a cam on said oscillatable member for engaging said blocking means to move said blocking means from its second position to its first position when said oscillatable member is shifted in its said reverse direction.



---

2,773,439

## PLOW TAIL WHEEL

Roy L. Chandler, Bell, Calif.

Application November 24, 1953, Serial No. 393,062
11 Claims. (Cl. 97—26)

8. In a two-way plow having a plow carrying frame supported for rotation from side to side on a substantially horizontal axis, a ground contacting wheel structure comprising: an arm; a wheel rotatably carried by said arm; pivot means connecting said arm to one side of said frame for pivotal swinging movements about a first axis transverse to said horizontal axis; adjustable vertically spaced first members carried by said one side of said frame; a second member movable with said arm; means supporting said first members and said second member for limited relative movements under the force of gravity to positions out of a path of engagement during movement of the frame from one of said sides to the other, and into a path of engagement of said second member and the lowermost of said first members as the frame approaches the end of its rotational movement in either direction.

---

2,773,440

## SURGE RELIEF MEANS

Robert A. Arthur, Culver City, Calif., assignor to The Garrett Corporation, Los Angeles, Calif., a corporation of California

Application February 24, 1949, Serial No. 78,195
11 Claims. (Cl. 98—1.5)

11. In mechanism for controlling the pressure in an enclosure, including: a balanced valve for controlling the flow of air; a pressure sensitive control element subjected on one side to enclosure pressure, said pressure sensitive element being operatively connected with said valve; walls defining a pressure chamber, the other side of said control element being subjected to pressure in said chamber; a fixed calibrated restricted connection between said chamber and the enclosure providing the sole communicating means with the interior of said control chamber; yielding means urging the pressure sensitive element in a valve closing direction; and means for positively opening said balanced valve.

---

2,773,441

## CONTROL FOR POWER-OPERATED TOASTER

Murray Ireland, Elgin, Ill., assignor to McGraw Electric Company, Elgin, Ill., a corporation of Delaware

Application April 10, 1953, Serial No. 347,936
8 Claims. (Cl. 99—329)

2. A power operated toaster comprising a toasting oven, electric means for toasting bread in said oven, bread carrying means including a sensing element movable by a bread slice, means for moving said carrying means between toasting and non-toasting positions, said moving

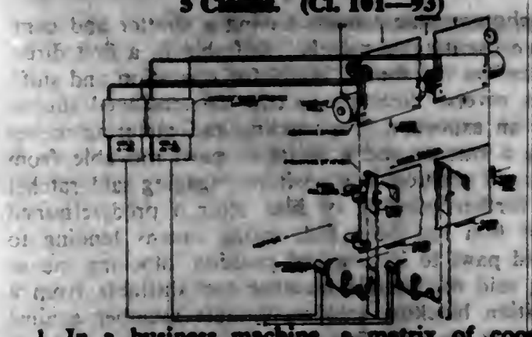
means including electric power means and spring return means, latch means for holding said carrying means in toasting position, electric input means for said toaster, a pair of spaced apart switch contacts, movable switch contact means alternatively engageable with said pair of spaced apart switch contacts alternatively to connect said electric toasting means and said electric power means to said input means, means for maintaining said movable switch contact means in an intermediate position out of engagement with both of said pair of fixed switch contacts, means operatively interconnecting said sensing ele-

ment and said movable switch contact means for moving said movable switch contact means upon placement of a bread slice on said bread carrying means from said intermediate position into engagement with one of said pair of switch contacts to effect energization of said electric power means for moving said carrying means to toasting position, and means operatively interconnecting said latch means and said movable switch contact means for moving said movable switch contact means from said one pair of switch contracts to the other to deenergize said power means and to energize said electric toasting means.

---

2,773,442
**TACO COOKING MACHINE**
Waldo L. Contreras, Scottsdale, Ariz.
Application March 15, 1954, Serial No. 416,022
2 Claims. (Cl. 99—404)

1. A taco cooking machine a work holding wheel having a horizontally journaled shaft, a pair of axially spaced thin work holding discs fixed at right angles to said shaft, work supporting fingers formed on said discs by cutaway radially disposed V-shaped notches having outwardly divergent work engaging edges on said fingers lying in planes parallel to the axis of rotation of said wheel, said edges providing the sole means for wedgingly engaging and supporting the tacos on said wheel, a semicircular guide member adjacent the periphery of the lower half of said wheel, and upwardly and outwardly sloping unloading devices between the axis of rotation of said wheel and said guide member to automatically remove tacos from said work holding wheel during the rotation thereof.



2,773,443
**APPARATUS FOR DEFINING CHARACTERS ON IMPRESSION-RECEIVING MATERIAL**
Donald Rudolf Lambert, Carshalton, England, assignor to Powers-Samas Accounting Machines Limited, London, England, a British company
Application February 16, 1954, Serial No. 410,656
Claims priority, application Great Britain March 18, 1953
9 Claims. (Cl. 101—93)

1. For defining characters on impression-receiving material, e. g. paper, apparatus comprising a platen, at least one stylus supported for movement lengthwise towards and away from the platen, a first stylus reciprocating element supported for reciprocation in a path determining one maximum dimension of a character, a second stylus reciprocating element co-acting with the marking end of the stylus and movable with said first element and relative thereto in a path normal to the path of said first element to determine the other maximum dimension of a character, a first operating means operatively coupled to said first element to effect reciprocation thereof, a second operating means operatively coupled with said second element and actuated in timed relation with said first operating means to effect a predetermined number of reciprocations of the second element for each reciprocation of the first element, and actuating means operable during movement of said first element in one direction of movement thereof to apply discrete impulses to the stylus to effect lengthwise movements thereof to cause its marking end to make character-defining marks on impression-receiving material disposed between the platen and the marking end of the stylus.

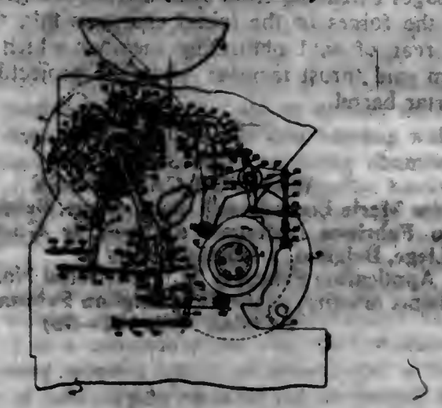
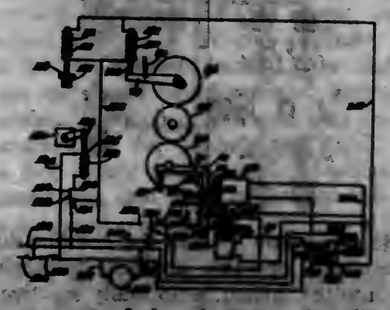
2,773,444
**MAGNETIC CORE STORAGE FOR BUSINESS MACHINES**
Gordon Earle Whitney, Derby, Colo., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application November 27, 1953, Serial No. 394,570
5 Claims. (Cl. 101—93)



1. In a business machine, a matrix of coordinately arranged bistable magnetic memory elements for registering in duplicate configuration coded information from a business record, a business record, means for sensing said business record and transmitting sensed information to said matrix in successive lines along one coordinate direction thereof to change the magnetic state of each magnetic element in said line corresponding to sensed bits in a correspondingly sensed line of said record, means for successively energizing groups of said elements in lines along another coordinate direction thereof to change the magnetic state of each said element changed during said operation of sensing said business record, the elements in each said last lines being equal in number to the number

of places in a code and means controlled by said elements responsive to a change in state for transmitting correspondingly coded electrical pulses suitable for the operation of a code responsive recording means.

---



2,773,445
**THROWOFF MECHANISM FOR PRINTING PRESSES**
James R. Wood, De Bary, Fla., assignor to Harris-Seybold Company, Cleveland, Ohio, a corporation of Delaware
Application March 19, 1953, Serial No. 343,297
18 Claims. (Cl. 101—218)

1. In a printing press, first, second and third cylinders, said second cylinder being adapted to occupy a position in printing relation to each of said first and third cylinders and having a shaft the axis of which is disposed to one side of the plane through the axes of said first and third cylinders, throwoff mechanism consisting of two oscillatable units, the first unit comprising a pair of inner eccentrics in which said shaft is mounted, and the second unit comprising said inner eccentrics and a pair of outer eccentrics in which the inner eccentrics are mounted, means for turning one of said units to throw said second cylinder out of contact with said first cylinder, means set in motion by the turning of said one unit for arranging the other unit to subsequently throw said second cylinder out of contact with said third cylinder, interconnecting means between said pairs of inner and outer eccentrics effective to tie them together during the turning movement of said second unit, and means effective upon said interconnecting means for moving the same independently to turn said first unit.

---

2,773,446
**ENDORSING APPARATUS OR THE LIKE**
Henry J. Keeber, Jr., Norridge, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Application May 27, 1953, Serial No. 357,777
8 Claims. (Cl. 101—233)

1. In apparatus of the character described, the combination of printing and impression rollers, sheet feeding means for sequentially feeding sheets to said rollers, means for positioning said rollers in and out of impression relation comprising electromagnetic means effecting said impression relation when deenergized, a switch connected in controlling relation with said electromagnetic means and under the control of a sheet fed by said feeding means for deenergizing said electromagnetic means during passage of said sheet between said rollers and while under said control, latch means for retaining said rollers out of impression relation and adapted to be rendered inoperative, electromagnetic means connected with said latch means for rendering said latch means inoperative when said second mentioned electromagnetic means is energized, a switch connected in controlling relation with said second mentioned electromagnetic means, and circuit connections for energizing said first mentioned electromagnetic means through said first mentioned switch and said second mentioned electromagnetic means through said second mentioned switch.

2,773,447
**VENTLESS DELAY ELECTRIC INITIATORS**
Cecil R. L. Hall, Saltcoats, and Idwal O. Lewis, Ardrossan, Scotland, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain
Application February 18, 1953, Serial No. 337,622
Claims priority, application Great Britain April 21, 1952
3 Claims. (Cl. 102—28)

1. A ventless short delay electric detonator comprising an electrically actuated igniting charge, an initiating charge and an interposed short delay element comprising a core of red lead and silicon and a lead sheath of a thickness less than the diameter of the core enclosed in a ventless container consisting essentially of copper, wherein the lead sheath of said short delay element is of such thinness as to be melted at substantially the same rate as that at which the flame front advances along the delay element on reaction of its core of delay composition and wherein the said sheath has a gas-permeable textile covering of a thickness to occupy the space between the said sheath and ventless container.

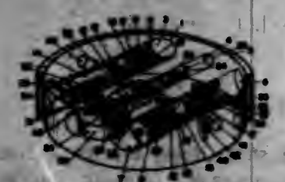
2,773,448
**ROCKET PROJECTILE**
Joseph Raymond Jasse, Paris, France, assignor to Societe Nouvelle des Etablissements Brandt, Paris, France, a French body corporate
Application January 7, 1955, Serial No. 480,565
Claims priority, application France January 21, 1954
6 Claims. (Cl. 102—49)



1. Self-propelled projectile comprising in combination: a hollow strong outer body the cavity of which communicates with the exterior at the front end through an axial tapped hole, this cavity extending up to the rear end of said body where it terminates in a tapped portion; a conventional fuse fitted in this axial hole in such manner as to extend partially into said cavity; an annular base fixed to the rear in said tapped portion of the cavity; an axial nozzle fixed in said base for connecting said cavity with the exterior; an offensive charge in said

mate contact with the entire surface of said cavity and with the portion of the fuse which extends into said cavity, this fuse being adapted to ignite said charge at the required moment and said charge comprising a blind axial longitudinal hole open at the rear in front of the entrance of said nozzle; an airtight thin container which is incombustible, provided with a front end and open at the rear, disposed in said longitudinal hole, the shape of which it matches exactly, and in intimate contact over its entire outer surface with said offensive charge; a propelling charge disposed in said container, an empty annular space being provided between said container and the propelling charge; an elastic device between the front end of said container and said charge for applying the rear end of the latter against the front annular face of said nozzle around the passageway in the latter; a firing device for igniting said propelling charge; and a sealing joint interposed between the rear ends of said container and said charge and, moreover, against the concentric front faces of said base and said nozzle.

---

2,773,449
**SAFETY DEVICE FOR A PROJECTILE**
Lars Anders Birger Karsberg, Karlskoga, Sweden, assignor to Aktiebolaget Bofors, Bofors, Sweden, a corporation of Sweden
Application February 10, 1953, Serial No. 336,156
Claims priority, application Sweden February 26, 1952
8 Claims. (Cl. 102—76)

1. A safety device for a projectile comprising a generally disc shaped base having two transverse bores and a third bore extending between said two bores, an arming member fitted in each of said transverse bores axially slidable between a safety position and an armed position and spring biased into its armed position, each of said arming members being formed with a circumferential groove situated in alignment with said third bore when the arming members are in the safety position, two lock bars disposed axially slidable in said third bore, the distal ends of said bars coacting with said grooves for locking the arming members in the safety position and the combined length of the bars being such that in the groove coacting position thereof the juxtaposed ends of the bars are spaced apart, a safety control member mounted for movement between a position filling said space between the respective bar ends for retaining the bars in the locking position and a position withdrawn from said space to release the bars from coaction with the grooves for movement of the arming members into the armed position by spring action, and release means for movement of the safety control member into its withdrawn position.

---

2,773,450
**MORTAR PROJECTILE**
Hans Otto Donner, Tampere, Finland, assignor to Soltam Ltd., Haifa, Israel
Application May 28, 1953, Serial No. 357,944
Claims priority, application Finland April 18, 1953
3 Claims. (Cl. 102—93)

1. In a mortar projectile for discharge from a mortar and having fins on its rear end, a frusto conically shaped thrust member extending rearwardly from the rear end of the projectile and having an internal cavity housing an initial charge, an obturating member removably mounted on said thrust member and having an outer diameter slightly greater than said fins and a reduced rearward extension surrounding said thrust member, said thrust member and said rearward extension having radially aligned

passages extending from said internal cavity for discharging the forces of the initial charge within the barrel to the rear of said obturating member which is removed from said thrust member when the projectile leaves the mortar barrel.

2,773,451
**WAD FOR CARTRIDGE**
Andre Marie Louis Rene Laloux, Liege, Belgium, assignor to Fabrique Nationale d'Armes de Guerre, Herstal-Liege, Belgium, a Belgian society
Application February 21, 1952, Serial No. 272,807
Claims priority, application Belgium February 21, 1951
1 Claim. (Cl. 102—95)

A one-piece wad for effectively separating the powder from the shot in a shotgun cartridge case comprising a cylindrical tubular body having a thin pliable wall and a transverse partition integral with the thin wall located between the ends of the tubular body and dividing the body into two back-to-back cups, one cup serving as the guiding means for the wad in the cartridge case and the other cup serving as the sealing means in the cartridge case; the height of the guiding cup being of a size to prevent the sealing cup from swinging or axial misalignment within the cartridge case.

---

2,773,452
**PUMP CONTROL SYSTEM**
Kenneth L. Berninger and William A. Weis, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application November 15, 1952, Serial No. 320,797
10 Claims. (Cl. 103—11)

1. In a fluid pressure system, the combination including, a continuously operable pressure developing source discharging into the system, a normally inactive auxiliary pressure developing source connected to said system, activating mechanism operatively associated with said auxiliary pressure developing source and including a servo actuated brake for activating said auxiliary pressure developing source, and pressure responsive means connected with said system for actuating said brake.

2,773,453
**ROTARY PUMPS**
William Gemeinhardt, Philadelphia, Pa.
Application September 12, 1952, Serial No. 309,233
4 Claims. (Cl. 103—83)

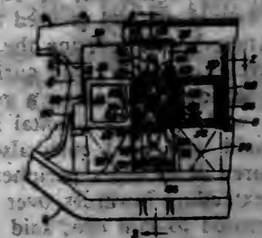
1. A rotary liquid pump comprising a closed housing having a pumping chamber therein and a flexible end closure wall, inlet and outlet connections in communication with said pumping chamber, a rotary driving member exteriorly disposed with respect to said housing wall, a vane type liquid impeller in said pumping chamber movable in a circular orbital path, said impeller having oppositely disposed vanes, and driving means for said impeller interposed between said impeller and said driving member and extending through said wall in fluid tight relation, said driving means including a shaft connected to said driving member with the longitudinal axis thereof disposed in a common plane with the rotational axis of said driving member and at an acute angle to the rotational axis of said driving member for movement of said driving means in a conical path with an apex point of the conical path intermediate the driving member and the impeller, said driving means including a spring for supporting said impeller, and said vanes being radially disposed with respect to said longitudinal axis.

---

2,773,454
**PUMP FOR LIQUID FOODS, DRUGS, AND LIQUID CHEMICALS**
Philipp Berdelle-Hilge, Philipp Schreiner, Wilhelm Blessing, and Richard Stifler, Mainz, Germany, assignors to Philipp Hilge, Mainz (Rhine), Germany, a firm
Application September 18, 1951, Serial No. 247,062
4 Claims. (Cl. 103—97)

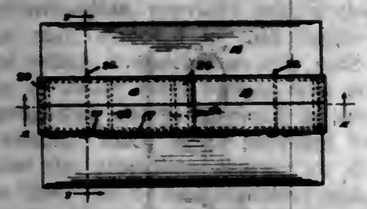
1. A pump for use especially with liquid foods and beverages, and pharmaceutical and chemical liquids, comprising a plurality of adjoining annular sections forming an externally cylindrical housing, at least two identical pump members disposed within said housing and each comprising an impeller and two guide members therefor, an electric driving motor, and a shaft common to said pumping members and said motor, said housing having formed therein at its end opposite to that at which said driving motor is located, inlet and discharge openings for the liquid being pumped, and suction and pressure passages associated with said inlet and discharge openings respectively for guiding said liquid within the housing, a first rotary slide, means associated with the slide for connecting said units in parallel and series, said slide being arranged transversely with respect to the shaft and between said pump units, said slide being also capable of changing the cross-sections of the inlet passage for admission of liquid to be pumped and of the outlet passage for withdrawal thereof, and a second rotary member arranged coaxially with said shaft and being capable of alternately connecting as known per se the openings of the housing with the suction channel and the pressure channel.

---



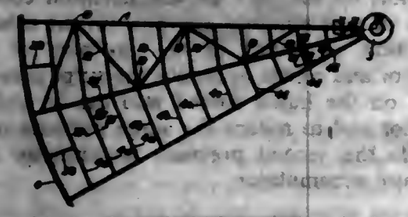
2,773,455
**ACCUMULATOR SYSTEM FOR PRESSURE SURGE RELIEF**
John Mercier, New York, N. Y.
Application June 25, 1953, Serial No. 364,117
18 Claims. (Cl. 103—223)

1. A system of the character described comprising a pump of the pulsating output type for delivering a liquid under pressure, a pressure accumulator having a liquid port connected to the outlet of said pump, a gas port and a movable partition intervening between said ports, a feed line connected to the outlet of said pump and a second pressure accumulator having a movable partition, a liquid port on one side of said partition connected to the outlet of said pump, a gas port on the other side of said partition connected to the gas port of said first accumulator and means to reduce the surge pressure from the pump on the liquid forced into the second pressure accumulator and to reduce the surge pressure on the gas forced into the second pressure accumulator from the first pressure accumulator.



---

2,773,456
**SNUBBED TRUCK**
George W. Crabtree, Granite City, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application July 30, 1952, Serial No. 301,663
16 Claims. (Cl. 105—197)



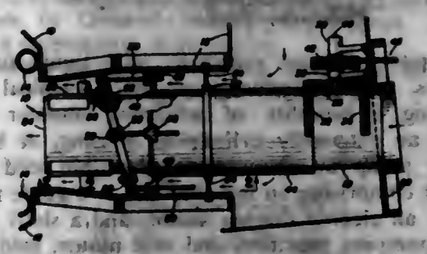
8. In a railway car truck, a pair of relatively movable truss type side frames, each side frame having a bolster opening defined by tension and compression members and spaced columns, an auxiliary column centrally disposed within said bolster opening and extending vertically between said members, a bolster spring-supported on said side frame and having a bifurcated end providing spaced legs having opposed friction faces disposed at opposite sides of said auxiliary column, said auxiliary column having a diagonal web disposed between said legs, and wedge-shape friction shoes in wedge engagement with opposite faces of said diagonal web and frictionally engaging their related friction faces on said bolster legs.

2,773,457
**STORAGE STRUCTURE HAVING ROOF OPENING AND CLOSURES THEREFOR**
Edward H. Prendergast, Ponde, Iowa
Application May 22, 1953, Serial No. 356,685
1 Claim. (Cl. 108—1)

In a storage structure, a housing having an opening in its top, sills projecting upwardly from the edges of said opening and coterminous therewith, a plurality of cover members for said opening, flanges depending from said cover members to interfit with said sills, said flanges and sills having registering openings therein, bolts extending through said openings to hold said cover members in position, and each of said cover members having at one end thereof a projection overlapping and interfitting with the end of the adjacent cover member.

2,773,458
**ROOFS FOR STORAGE TANKS OR SIMILAR STRUCTURES**
Robert Henry Foster, London, England, and James McLean, Motherwell, Scotland
Application February 19, 1953, Serial No. 337,844
4 Claims. (Cl. 108—32)

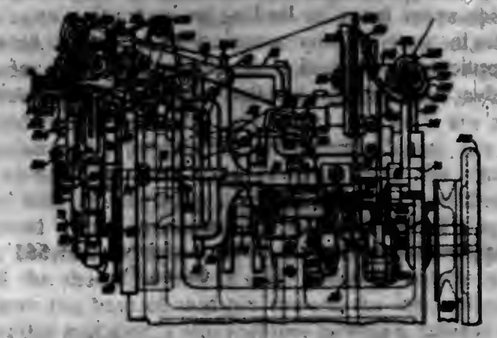
1. In a tank having a vertical cylindrical wall and a conical roof, said roof comprising a peripheral curb, a plurality of upwardly convex, radially disposed and diametrically opposite ribs having their outer ends abut against the curb, a centrally disposed crown member to which all the ribs are secured at their inner ends, each pair of diametrically opposite ribs having rigid continuity through the crown member and constituting a two-pin arch, roof sheets secured together to constitute a continuous spherical membrane and secured at its periphery to the curb, said membrane covering the arches formed by the ribs and crown member; said curb comprising a continuous angle section ring having a vertical limb secured to the side wall and a horizontal limb projecting outwardly from said wall, said curb also including an annular plate secured at its outer periphery to the angle section ring and extending inwardly over the outer ends of the ribs and secured to said ribs; said crown member comprising a cylinder and a pair of superimposed horizontal plates secured respectively to the upper and lower ends of the cylinder, and a plurality of circumferentially disposed purlins extending between each pair of adjacent ribs and supporting the roof sheets.



2,773,459
**PROTECTIVE WALL FOR USE AGAINST RADIATION AND EXPLOSIVE FORCES**
Paul S. Seehy, New York, N. Y.
Application September 23, 1950, Serial No. 186,332
2 Claims. (Cl. 109—82)

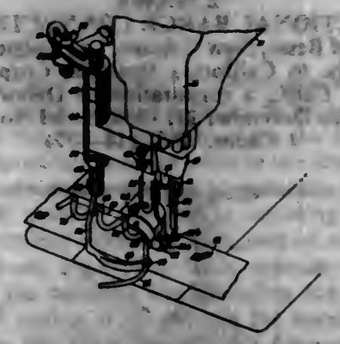
1. A radiation and explosive force proof wall comprising an inner layer of concrete, a layer of resilient material at the inner side of the concrete layer, a plurality of stacked frames each having a top plate, a bottom plate, and side plates interconnecting the ends of said top and bottom plates, said top and bottom plates extending at right angles to said layers, and said side plate extending at right angles to said layers and top and bottom plates, and said frames further comprising a plurality of corrugated sheets with the crests of each sheet contacting the troughs of adjacent sheets, and said sheets

extending generally at right angles to said top, bottom and side plates, the inner edges of said top, bottom and side plates being embedded in said resilient layer, the bottom plate of one frame contacting the top plate of the next adjacent frame therebelow, a layer of heat resisting material at the outer sides of said frames with the outer edges of said top, bottom and side plates being embedded in said heat resisting layer, and an outer sheet metal layer contacting the outer side of said heat resisting layer.

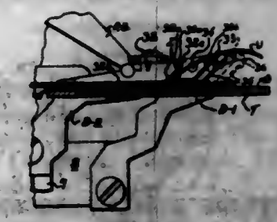


2,773,460
**TILTING BURNER MECHANISM**
Konrad S. Svendsen, Bellerose, N. Y., assignor to Combustion Engineering, Inc., a corporation of Delaware
Application March 11, 1953, Serial No. 341,693
6 Claims. (Cl. 110—28)

1. A tiltable burner comprising a straight conduit having a terminus disposed in a plane inclined at a predetermined angle to the axis of the conduit, tip means comprising a relatively short straight conduit member having an end disposed in a plane inclined at a similar angle to its axis, means joining said terminus of the first mentioned conduit and said end of the relatively short conduit so that said terminus and said end are juxtaposed to one another and said short conduit forms an extension of the first named conduit, said joining means substantially preventing relative axial movement between said terminus and said end while permitting relative rotary movement therebetween, and means including common drive mechanism operative to simultaneously rotate said conduits in opposite directions and equal angular increments.



2,773,461
**SHOE SEWING MACHINES**
Alfred S. Clark, Beverly, Mass., assignor to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application January 9, 1952, Serial No. 265,660
11 Claims. (Cl. 112—47)



1. A shoe machine adapted for sewing an upper to a sock lining attached to the inner surface of a platform sole, the inner edge of which beneath the sock lining is rabbeted, having stitch forming devices including a curved needle and a work support disposed with its work engaging surface at an angle to that part of the needle path along which the needle engages the work to cause the needle to enter the upper and sock lining and to emerge adjacent to the edge of the sole through the rabbet, in combination with means for securing and feeding the work comprising a non-feeding clamp and a feeding clamp, each of which includes a presser foot and a gage member having its extremity disposed between the corresponding presser foot and the work support to fit within the rabbet of the platform sole beneath the upper and sock lining, the work feeding clamp being actuated relatively to the non-feeding clamp to transfer the point of operation along the margins of the upper and sock lining.

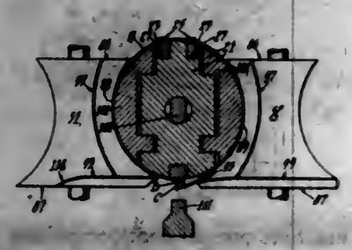
2,773,462
**LOOPED CORD TRIMMING ATTACHMENT FOR SEWING MACHINES**
Edward L. Seaman, Garden City, N. Y., assignor to S. & W. Sewing Machine Attachment Co., New York, N. Y., a partnership
Application March 6, 1953, Serial No. 340,743
6 Claims. (Cl. 112—100)

1. An attachment for a sewing machine of the type having a standard, a work support, an arm, a head, a rotating main shaft having a drive pulley at one end, a vertically reciprocating needle driven thereby, and a presser foot, said attachment forming loops of cord-like material on a base fabric and comprising: a first bracket attachable to said head to extend rearwardly thereof and having a vertical bore, a feed shaft rotatably supported in said bore, an actuating arm secured to said shaft; a second bracket attachable to said standard, a cam shaft carried thereby, driving means adapted to connect the cam shaft to the drive pulley end of the main shaft of the machine, a cam on the cam shaft, and means actuated by said cam having a driving connection with said actuating arm; a forwardly extending arm carried by said feed shaft and having a cord-guiding forward end adapted to swing across a vertical plane parallel to the direction of feed in which the needle reciprocates and closely in front of said needle, and loop forming means adapted to be fixed to said presser foot and disposed close to said work support laterally of said plane around which said material is wrapped by the swinging of said arm to form loops.

2,773,463
**SHIRRING DEVICE**
Joseph T. Jolle, Minneapolis, Minn., assignor, by mesne assignments, to The Singer Manufacturing Company, Elizabeth, N. J.
Application March 11, 1954, Serial No. 415,515
1 Claim. (Cl. 112—132)

A sewing machine presser-foot comprising an elongated rear section having a substantially flat under surface, a forwardly and upwardly inclined toe portion, and a laterally offset attachment arm at one side thereof; a forward presser and guiding section spaced forwardly of said rear section and including an attachment arm; said two attachment arms being splined together whereby the said forward section may be slidingly shifted lengthwise of said rear section; said forward section having an inclined plate extending laterally from the forward attachment arm to be disposed in parallelism with and forwardly of the toe portion of said rear section; a thin L-shaped plate having one limb thereof secured flat against the forward inclined face of said plate with the other limb thereof extending beneath said plate and terminating in a transverse edge spaced a short distance forwardly of the toe portion of said rear section to provide a transverse slot; and a screw releasably locking said two attachment arms together in various selected positions of relative adjustment thereby to vary the width of said slot.

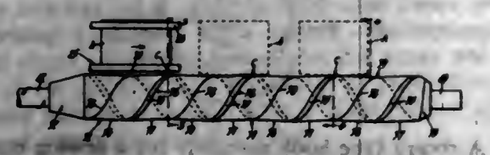
2,773,464
**SEWING MACHINE HOOK AND BOBBIN RACE ASSEMBLY**
Hector Rabezzana, Fenton, Mich.
Application September 28, 1953, Serial No. 382,656
3 Claims. (Cl. 112—228)



1. A rotary type hook assembly for a sewing machine, said hook assembly comprising a bobbin case having an annular flange, a hub member adapted to be secured to a rotary driving shaft, a hook member mounted on said hub member, said hub member and said hook member having co-operating surfaces engaging said flange to support said bobbin case and defining a race for said flange, circumferentially spaced radially extending projections on one of said members, co-operating circumferentially spaced locking surfaces on the other of said members,

said members being rotatable relative to each other between a locked position in which said projections engage said co-operating locking surfaces to prevent relative axial movement of said members and an unlocked position in which said projections are disengaged from said locking surfaces and in which said members may be moved axially apart, and key means mounted on and interconnecting said members to hold said members in said locked position.

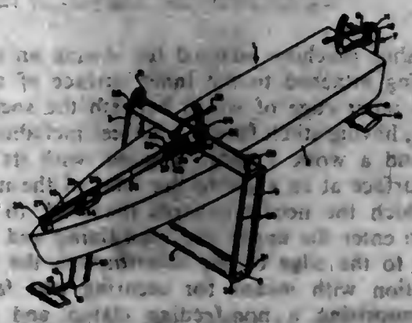
---



**2,773,465**
**CAN BODY MAKING MACHINE WITH ROTATABLE SEAM ASSEMBLING MECHANISM**
Erik Godde, Park Ridge, Ill., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application October 1, 1953, Serial No. 383,548
10 Claims. (Cl. 113—8)

2. In a can body making machine and the like, the combination of a can body mandrel for supporting a partially formed can body having an outwardly extending side seam hook and an inwardly extending side seam hook initially separated from one another, means for advancing said can body along said mandrel, eccentrically mounted rotatable means disposed adjacent opposite sides of said mandrel, said rotatable means having body engaging surfaces movable opposite to the direction of travel of the advancing can bodies for directly engaging the sides of said can body and forcing these sides inwardly towards and into contact with said mandrel, cam means on said rotatable means for sequentially directly contacting said can body sides adjacent their side seam hooks for pressing said hooks against said mandrel and into overlapping relation, means for actuating said rotatable means in time with said body advancing means, and means on said rotatable means to release the pressure against said can body sides whereby said sides bulge outwardly to interengage said overlapping side seam hooks.

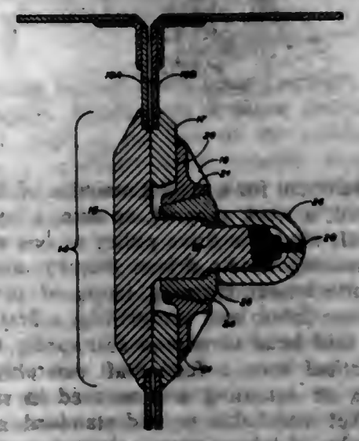
---



**2,773,466**
**METHOD OF SOLDERING CAN BODY SIDE SEAMS**
Erik Godde, Park Ridge, Ill., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application July 22, 1952, Serial No. 300,256
3 Claims. (Cl. 113—120)

1. The method of soldering the side seams of can bodies with a rotating spiral solder applicator having a long lead, greater than the length of the individual can bodies, said side seams being subject to bowing by the heat applied thereto incidental to soldering, which method comprises the steps of advancing can bodies in processional order with their side seams in substantially longitudinal alignment while maintaining the axes of said can bodies parallel to the axis of said spiral solder applicator, applying solder to each side seam with only a single spot of the rotating spiral applicator in solder applying contact with the seam at any time, said spot of solder application being moved along the seam in a direction opposite to said advancement of the can bodies, whereby successive spot applications of solder traverse each side seam from its leading to its trailing edge at a said single spot thereby assuring full contact between said applicator and said seam throughout each of said successive applications whether the seam is bowed or not.

---

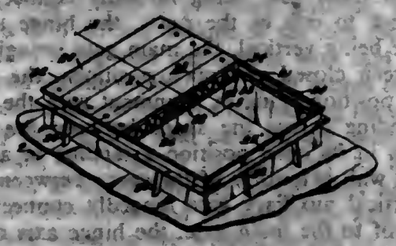


**2,773,467**
**HYDROFOIL CRAFT**
David Z. Bailey, Charlestown, R. I.
Application January 9, 1952, Serial No. 265,551
7 Claims. (Cl. 114—66.5)

7. In a water craft having a main hydrofoil pivotally supported below the level of the underside of the craft; the improvement which comprises a control hydrofoil; means supporting said control hydrofoil below the level of the underside of the craft, said control foil being movable about a horizontally extending pivot axis forward of said control foil whereby said control hydrofoil assumes an approximately streamline path through the water beneath the surface thereof when said craft has forward velocity with respect to the water; and linkage connecting said control hydrofoil and said main hydrofoil, whereby changes induced in the angular position of said control hydrofoil are reflected by corresponding changes in the angular position of said main hydrofoil.

---

**2,773,468**
**SECTIONAL BARGE CONNECTION**
Celestino Paul Bosso, New Orleans, La., assignor, by mesne assignments, to California Research Corporation, San Francisco, Calif., a corporation of Delaware
Application December 21, 1954, Serial No. 476,626
1 Claim. (Cl. 114—77)



In apparatus for assembling a work structure from a plurality of barge hull sections while said sections are afloat wherein a plurality of pin members project outboard from the side of one of said hulls, and pin-receiving openings are formed in corresponding wall portions of an opposed hull, the combination comprising a pin member having a shank portion, a threaded end portion and an enlarged head portion adapted to be secured to the side wall of one of said hulls, a backing ring surrounding the pin-receiving opening in the opposing hull side wall, said backing ring having an opening substantially larger in diameter than the shank of said pin to permit free passage of said pin therethrough and to permit rough registration of said opposed hulls while said hulls are afloat, a tapered collar member of appreciably larger size than said threaded portion to pass freely over the threaded end of said pin to bring its flange portion into flush engagement with the inboard face of said backing ring, said collar member having a tapered surface adapted to surround the shank portion of said pin and radially diverging from the base of said pin toward the inboard side of said collar member, a slip member having a tapered outer surface of lesser size than the tapered collar member and an inner surface of generally the same size as said shank to closely engage said shank of said pin and adapted to have its tapered surface substantially fully received within the tapered surface of said collar member, and cap means for threadably engaging the outer end of said pin to force said slip member into seating engagement within said collar member and to center said pin within said backing ring and thereby seal said opposed barge hulls together as an enlarged working structure.

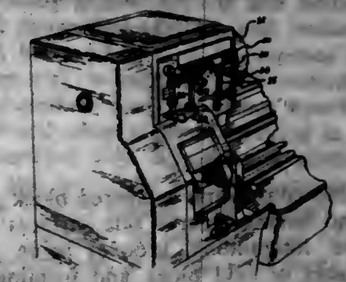
---

**2,773,469**
**HATCH COVER**
Edward G. Carruthers, Arlington, and Robert Lowry, Falls Church, Va.
Application August 5, 1953, Serial No. 372,468
2 Claims. (Cl. 114—201)

2. In a hatchway, a cover, a coaming having a lower ledge and an upper ledge, the upper ledge being located further from the hatch opening than the lower ledge, and a plurality of hatch cover units in the hatch opening, each cover unit being a unitary structure which is of angular cross section and has a covering leg and a beam leg extending vertically with respect to the covering leg, the beam leg resting at its opposite ends on the lower ledge, the covering leg extending out beyond the beam leg and resting at its ends on the upper ledge, and a ledge along the beam leg of each covering unit supporting the side of the cover leg of an adjacent hatch cover unit.

---

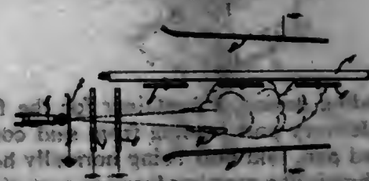
**2,773,470**
**SURVEYOR'S STAKES**
John Alger, Lakewood, Colo.
Application September 29, 1954, Serial No. 459,159
6 Claims. (Cl. 116—114)



1. A surveyor's stake comprising a length of structural angle iron, an inclined lower extremity on said length forming a point at the intersection of the two legs of the angle iron, the upper extremity of said length being cut at right angles to form a flat driving extremity, and a metallic strip extending longitudinally of said length adjacent said driving extremity and being secured

at its sides to the two legs of the angle iron to form a triangular socket at the upper extremity of said stake.

---



**2,773,471**
**SPEED INDICATING PLATE FOR MACHINE TOOLS**
Harold J. Siekmann, George J. Kasselmann, and William Okvit, Cincinnati, Ohio, assignors to The R. K. Le Blond Machine Tool Company, Cincinnati, Ohio, a corporation of Delaware
Application November 7, 1955, Serial No. 545,352
3 Claims. (Cl. 116—115.5)

1. A speed indicating plate for a machine tool transmission having a pair of shifter levers comprising, a series of vertically extending horizontally spaced boxes located directly above the shiftable positions of one of said levers, a series of horizontally spaced pointer indicating marks on the bottom edge of said plate to one side of said vertically extending boxes and positioned directly above the shiftable positions of said other lever, and horizontally extending vertically spaced indicating boxes merging with said pointer indicating marks extending upwardly from the lower edge of said plate, said horizontally extending box being arranged transversely across said vertically extending boxes.

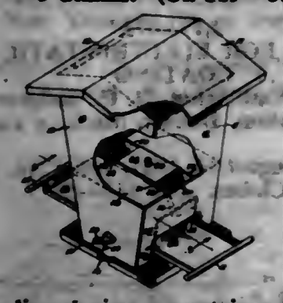
---

**2,773,472**
**APPARATUS FOR ELECTROSTATIC SPRAY COATING**
Lewis J. Lamm, Washington, D. C., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application August 14, 1951, Serial No. 241,858
4 Claims. (Cl. 118—51)

1. Apparatus for electrostatic spray coating of articles to be coated including, in combination, means structurally supporting and conveying said articles in a given direction through a coating area; a spray gun projecting particles of coating material in a direction parallel to the direction of

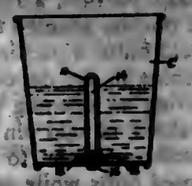
movement of said articles through said area; means charging said particles including a plurality of discharge electrodes disposed in a plane normal to the direction of the spray from the gun and in the path of the spray, a collector electrode spaced from said plane of discharge electrodes and located between the discharge electrodes and the gun, and a high potential power source connected to said discharge electrodes and said collector electrode and establishing a highly ionized current conducting atmosphere therebetween through which said particles are projected; a broad, flat deflecting electrode of large surface area relative to said discharge electrode disposed subtantially parallel to and along the path of said spray particles passing through said charging means within said coating area and means for electrically charging said deflecting electrode relative to said articles to a polarity similar to that of said particles, said flat deflecting electrode being substantially free of discharge points and providing an electrostatic repulsion zone of substantially uniform intensity to deflect the particles from the direction in which they are projected from said spray gun and in a direction toward said articles.

---



2,773,473
**BIRD NIBBLES**
Jonathan Martin, Preston, England
Application February 28, 1955, Serial No. 491,140
1 Claim. (Cl. 119—18)

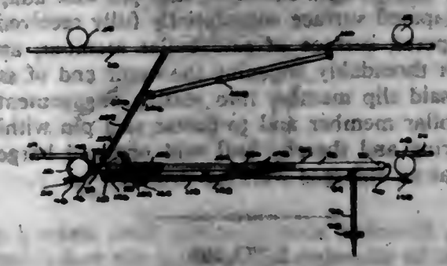
A bird nibble comprising a tapered block of palatable ingredients and having tapered side surfaces and a front and rear face, longitudinal grooves being provided in the side surfaces of said block and forming a dovetail thereon, and a tapered holder complementary to said block, said holder comprising a flat plate having upstanding and turned-in marginal portions extending its entire length and adapted to engage into the grooves in said block, the grooves in said block extending from one end of the block to the other end and disposed substantially nearer the rear face than the front face thereof.



---

2,773,474
**BIRD FEEDER**
Nugent Dodds, Washington, D. C., assignor to George Hume, Washington, D. C.
Application November 10, 1954, Serial No. 467,923
8 Claims. (Cl. 119—55)

1. In a feeding device, a container for the feed to be dispensed, a delivery port leading from said container to a rockable feed pan, said port being normally held closed by a resilient brush-like member forming part of said port, and feed release means for said feed comprising a reciprocable member disposed in said port to force a portion of said feed past said resilient member, said feed release means being operatively connected to said rockable feed pan and movable therewith.

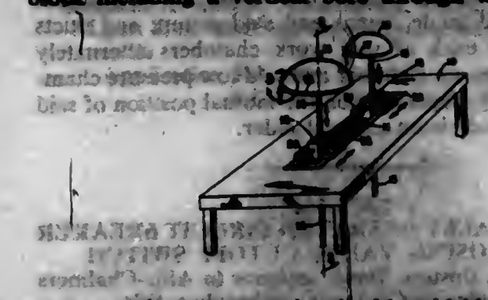


2,773,475
**DEVICE FOR WEANING YOUNG ANIMALS**
Robert A. Zottoli, Brunswick, Maine
Application October 14, 1954, Serial No. 462,177
3 Claims. (Cl. 119—71)

1. A device for weaning an animal comprising a container having a bottom, a false nipple extending substantially normally from a midportion of said bottom a distance less than the height of said container.

---

2,773,476
**CATTLE GATE AND CHUTE**
Jess W. Thomas, Decker, Mont.
Application August 14, 1953, Serial No. 374,169
3 Claims. (Cl. 119—99)



1. The combination, with a chute including laterally spaced, parallel, vertical, back and front walls, the front wall including vertical gate posts spaced longitudinally of the front wall, of: a main gate of a width approximately equal to the horizontal distance between the gate posts, said main gate being hingedly connected at one side thereof to one of the posts, the hinge axis of the main gate being vertical, the main gate swinging on said axis between closed and open positions, the gate when in closed position being in alignment with the front wall and extending across the space between the posts, the gate when in its open position extending at an angle to said front wall exteriorly of the space between the walls; and a vertical auxiliary gate hingedly connected at one side thereof to the main gate, the hinge axis of the auxiliary gate extending in closely spaced parallel relation to the hinge axis of the main gate, the auxiliary gate being of a width at least substantially equal to the distance between said walls, said auxiliary gate being swingable on the main gate, in each of said positions of the main gate, between closed and open positions, the auxiliary gate in its closed position extending across the chute from one to the other wall and in its open position being disposed against the main gate.

---

2,773,477
**VETERINARY TABLE**
Robert B. Michael, Culver City, Calif.
Application December 2, 1955, Serial No. 550,596
4 Claims. (Cl. 119—103)

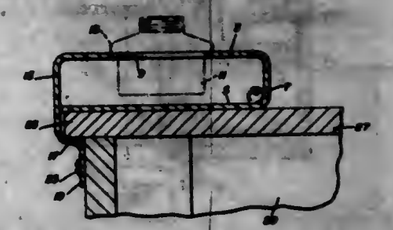
4. An elongated veterinary table for holding animals, comprising, in combination: a pair of horizontal tracks longitudinally secured to said table substantially midway between and parallel to the longitudinal edges of said table; animal support means including at least one vertical rod extending upwardly from said tracks and terminating at its upper end in an engaging means for supporting the underside of an animal; and a block member having lateral flanges adapted to ride on the upper surfaces of said tracks and having downwardly depending flanges extending between said tracks, said block including a vertical bore through which said rod passes; and means associated with said block adapted to bear against said rod to retain said animal engaging means at a desired level above said table.

---

2,773,478
**CARTRIDGE PROJECTING AND RETRACTING MECHANISM FOR BALL POINT PENS**
William Bernard Poloucek, Culver City, Calif.
Application March 6, 1953, Serial No. 340,754
4 Claims. (Cl. 120—42.03)

1. A writing implement comprising a tubular body, writing means axially slidable in the body between projected and retracted positions, spring means in the body urging the writing means into retracted position with respect to the body, advancing means reciprocable in the body for engaging and forcing the writing means from its retracted position to its projected position against the action of said spring means, locking means engageable with the writing means and means on the advancing means for holding the writing means in projected position, spring means urging the locking means laterally with respect to the body and into a position wherein it may lock the writing means in projected position, said body presenting a cam surface oblique to the axis thereof, said locking means being also engageable with said cam surface, and said means on the advancing means engageable with the locking means to force the locking means axially of the body and against said cam surface, when the advancing means is retracted in the body to cause the locking means to move laterally in the body against the action of the last-mentioned spring means and clear the writing means allowing the writing means to retract.

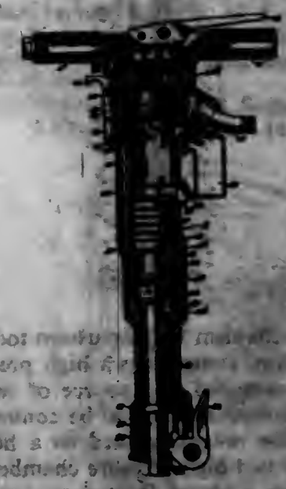
---



2,773,479
**FOUNTAIN PEN**
Nolan Kent Rhoades, Milton, Wis., assignor to The Parker Pen Company, Janesville, Wis., a corporation of Wisconsin
Application March 1, 1952, Serial No. 274,371
11 Claims. (Cl. 120—50)

4. In a fountain pen, a barrel having a bore opening through its forward end, the bore including a rear relatively large portion and a forward reduced portion, and a self-contained writing unit removably mounted in the bore including a rigid cartridge casing having a reduced tubular portion extending into the reduced portion of the bore, a writing nib supported by said tubular portion, a capillary reservoir element in said casing having a portion in ink feeding relation with said nib, said casing having radially extending channel shape projections rearwardly of said tubular portion engaging in complementally shaped grooves in the barrel operative for preventing rotation of the writing unit in the barrel, said casing having openings into said projections forming passages communicating with said reservoir element, and the bore of the barrel being so shaped as to form a passage from the exterior communicating with the first passages in bypassing relation to said tubular portion of the casing.

---

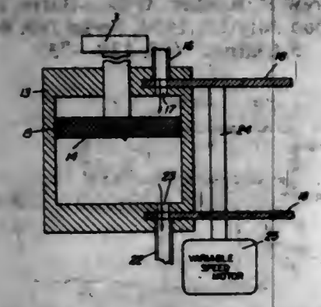


2,773,480
**HOLDERS FOR BOTTLES AND OTHER CONTAINERS**
Andrew R. Kosher, Wilkes-Barre, Pa.
Application July 19, 1954, Serial No. 444,169
5 Claims. (Cl. 120—73)

1. A holder for attachment on a desk top at one edge to support a container in upright position comprising an oblong rectangular frame of resilient strip material including vertically spaced flat top and bottom walls and a front wall connecting said top and bottom walls, said bottom wall being adapted to be imposed on said desk top, said top wall terminating in a vertical rear flange depending therefrom past and being seperate from said bottom wall and adapted for positioning in front of said edge and provided with a horizontal portion, said vertical flange and horizontal portion being vertically movable relative to said bottom wall whereby said horizontal portion is adapted to underlie said edge and coact with said bottom wall to clamp said frame to said edge, said top wall having a central opening therein for receiving the container therein.

---

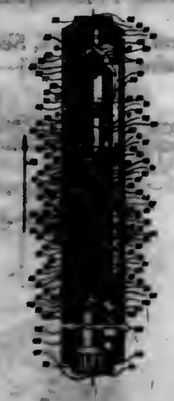
2,773,481
**PERCUSSION TOOLS**
Archie Blake, Buffalo, N. Y., assignor to Mechanical Research Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application January 14, 1954, Serial No. 404,115
6 Claims. (Cl. 121—12)



1. In combination with a pressure fluid percussion tool having a cylinder and a hammer actuated by the pressure fluid and mounted for reciprocation in the cylinder for actuating a work member, at least one expansion tank communicating through a manually operable valve

with said cylinder adjacent the upper end thereof, whereby the stroke length of said hammer is increased when the valve is open and said tank is in open communication with said cylinder.

---



2,773,482
**FLUID-OPERATED VIBRATION TEST EXCITER**
John A. Dickie, Hamden, Conn., assignor, by mesne assignments, to Textron Inc., a corporation of Rhode Island
Application July 21, 1954, Serial No. 444,242
16 Claims. (Cl. 121—38)

1. A fluid-operated vibration test exciter comprising a cylinder, piston means and stationary head means jointly forming with the piston means two chambers of variable capacity in the cylinder, rod means rigidly attached to the piston means and lying longitudinally in the cylinder, there being inlet and discharge ports in the cylinder in each of the chambers and rotary disk means in direct contact with the cylinder having holes therein adapted to act as valve ports for said inlet and discharge ports in continuous succession; whereby displacement of the piston in sinusoidal motion is obtained.

2,773,483
**DRIVE MECHANISMS FOR PERCUSSION TOOLS OPERATED BY A PRESSURE MEDIUM**
Endre Gál and Károly Gerber, Budapest, Hungary, assignors to "Licencia" Találmányokat Értékesítő Vállalat, Budapest, Hungary
Application November 3, 1952, Serial No. 339,496
Claims priority, application Hungary November 3, 1951
13 Claims. (Cl. 121—30)

1. A drive mechanism for percussion tools operated by a pressure medium, comprising a high pressure chamber adapted to be connected to a source of such medium; a low pressure chamber adapted to be connected to the atmosphere; a guide means formed as a hollow rod and situated between said high pressure chamber and said low pressure chamber; a piston formed as a tool carrier and slidably arranged between two extreme positions along and around said guide means; a slider formed as a control means and slidably arranged between two extreme positions along said piston; a pair of work chambers arranged between said guide means and said piston on opposite ends of said guide means, the volumes of said work chambers varying alternately depending on the mutual position of said guide means and said piston; and ducts for connecting each of said work chambers alternately to said high pressure chamber and said low pressure chamber, respectively, depending on the mutual position of said guide means, said piston and said slider.

---

2,773,484
**PNEUMATICALLY OPERATED CIRCUIT BREAKER WITH CLOSING VALVE CUTOFF SWITCH**
Henry L. Peek, Boston, Mass., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Application December 27, 1952, Serial No. 328,215
13 Claims. (Cl. 121—38)

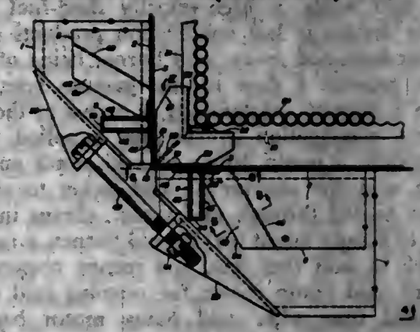
6. In an operating mechanism for circuit breakers, a motor operable by gas under pressure and comprising a cylinder and a piston movably arranged therein, a source of gas under pressure, electrically operated valve means for admitting gas under pressure from said source to said cylinder to close the breaker, and a gas blast cutoff switch for controlling the deenergization of said valve means comprising a pair of arcing contacts actuated by gas under pressure from said cylinder passing through said switch.

---

2,773,485
**SELF-LOCKING ACTUATOR**
Howard M. Geyer, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application September 9, 1954, Serial No. 454,916
11 Claims. (Cl. 121—40)

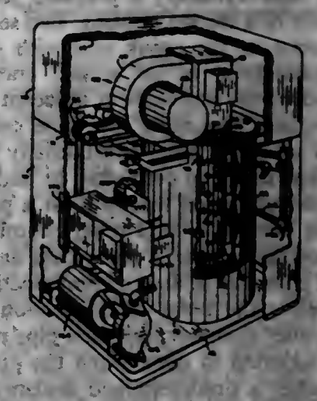
1. A fluid pressure operated rotary actuator, including in combination, a cylinder, a reciprocable piston disposed in said cylinder capable of fluid pressure actuation in either direction, an output member rotatably supported in said cylinder, means interconnecting said piston and said output member for imparting rotation to said output member upon reciprocation of said piston, and releasable locking means operatively connected with said piston for preventing movement thereof and hence locking said output member against movement, said locking means being independent of said rotary output member.

2,773,486
**VALVE MEANS FOR A FLUID PRESSURE SYSTEM**
Kenneth A. Albers, Minneapolis, Minn., assignor to Char-Lynn Co., Minneapolis, Minn., a corporation of Minnesota
Application February 16, 1955, Serial No. 488,552
2 Claims. (Cl. 121—158)



1. Automatic reversing valve means for a fluid pressure system comprising housing structure defining a pair of spaced longitudinally extending cylindrical cavities each having five longitudinally spaced radially enlarged portions intermediate the ends of said cavities which define valve chambers, the opposite ends of said cavities defining pressure chambers, the pressure and valve chambers of each cavity being separated one from another by reduced bore portions of the cavity; said housing structure defining: a passage from the central valve chamber of one cavity to the central valve chamber of the other cavity, a pair of passages each from a different one of the two valve chambers on each side of the central valve chamber of said one cavity to and communicating with a different one of the pressure chambers of said other cavity, a pair of passages each from a different one of said two valve chambers to a different one of two outlet ports adapted to be connected to the opposite ends of the cylinder of a fluid motor, a pair of passages each from a different one of the two valve chambers on either side of the central valve chamber of said other cavity to and communicating with a different one of the pressure chambers of said one cavity, passages interconnecting the four end valve chambers of said cavities, a fluid pressure inlet port, a fluid pressure outlet port, a passage connecting one of said fluid pressure ports to the interconnected end valve chambers, and a passage connecting the other fluid pressure port to the connected central valve chambers; two longitudinally extending cylindrical valve plungers each mounted for reciprocating movement in a different one of said cavities between two positions, each plunger having longitudinally extending end portions thereof in engagement with the structure defining the reduced portions of its associated cavity which are between the end valve chambers and pressure chambers thereof for preventing communication between the pressure chambers and end valve chambers of said cavities during the movement of said plungers, said plungers having alternating normal and reduced diameter portions, the normal portions of said plungers engaging portions of said structure defining reduced bore portions of said cavities for preventing communication between adjacent valve chambers and said reduced diameter portions of said plungers permitting communication between two adjacent valve chambers, the normal and reduced portions of said plungers being so disposed with respect to said cavities that each intermediate valve chamber is in communication with the valve chamber on one side thereof and not in communication with the valve chamber on the other side thereof at one position of each plunger and so that at the other position of each plunger communication between adjacent valve chambers is reversed and each intermediate valve chamber is not in communication with said valve chamber on the one side thereof and is in communication with said valve chamber on the other side thereof; and means for releasably latching the plunger mounted for movement in said other cavity at each of the two positions between which said plunger is movable.

---



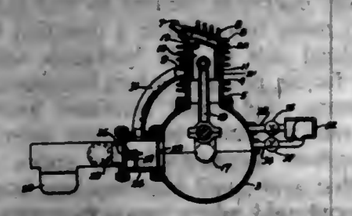
2,773,487
**FURNACE HAVING WALLS ORGANIZED FOR CUBICAL EXPANSION**
Paul R. Walter, East Orange, N. J., and Ernest C. Witzke, Bayside, N. Y., assignors to Combustion Engineering, Inc., a corporation of Delaware
Application August 27, 1952, Serial No. 306,604
16 Claims. (Cl. 122—6)

3. In a furnace of the type described, wall structure having an inner facing exposed to hot combustion gases generated within said furnace and an outer casing spaced from and supported by said inner facing with thermal insulation interposed between said inner facing and said outer casing, said outer casing including a plurality of generally parallel buckstays secured to said inner facing in a manner to move therewith in a direction transverse to the longitudinal axis of said buckstays and parallel with said inner facing, panel members interposed between adjacent buckstays, said panel members having edges juxtaposed to said buckstays and rigidly interconnected therewith throughout substantially the entire length of said edges so that said panel members are integral with the buckstays and said edges move therewith and are joined therewith in a fluid tight manner, a flexible flange formed at one of the edges of said panel members in overlying relation with the adjacent buckstay, and flexible means fluidly sealing the ends of said flange with said adjacent buckstays in a manner permitting relative movement therebetween in said transverse direction.

---

2,773,488
**BOILER-BURNER UNIT**
Calvin D. MacCracken, Tenafly, N. J., George N. Miles, Orangeburg, N. Y., and Tesfai N. Ashfaie, Bergenfield, N. J., assignors to Jet-Heet, Inc., Englewood, N. J., a corporation of New York
Application February 21, 1952, Serial No. 272,783
9 Claims. (Cl. 122—161)

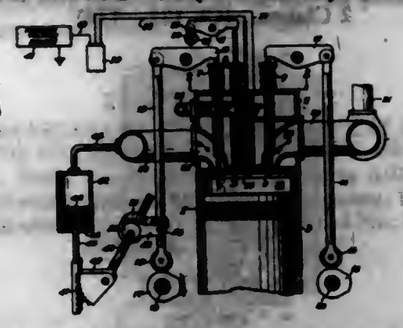
3. In a boiler-burner unit, a multilayer heat-exchanging water jacket, said jacket layers comprising pairs of thin sheet metal walls sealed together at their edges and



ated cylinder into two compartments, one of said pair

2,773,494

at a plurality of spaced points intermediate said edges and separated except where sealed together to provide multiple fluid paths within said jacket, said jacket layers being coupled together to provide a continuous fluid path from the innermost to the outermost of said layers, the innermost of said layers encompassing a substantially cylindrical space, said jacket being shaped to define between said layers a continuous path extending from said space encompassed by the innermost of said layers to the outermost of said layers, the maximum spacing between the walls of adjacent ones of said layers being no greater than about three times the maximum inside separation of said walls, a high-velocity fluid-fuel burner mounted to discharge hot combustion products directly into said encompassed space, said burner being of a type adapted to provide a flow of hot gaseous combustion products at a velocity substantially in excess of the velocity of flame propagation of the fuel supplied to said burner, a motor, a pump driven by said motor and communicating with the interior of said jacket to circulate water to be heated through said jacket, means including a fuel line to supply liquid fuel to said burner, a normally closed valve in said fuel line, and means responsive to operation of said pump motor for opening said valve a predetermined time after said pump motor begins to operate.



---

**2,773,489**
**INTERNAL COMBUSTION ENGINE**
**William C. Estes, Redding, Calif.**
**Application May 2, 1955, Serial No. 505,432**
**3 Claims. (Cl. 123—59)**

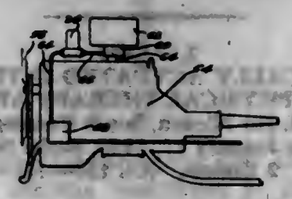
1. An internal combustion engine comprising a cylinder; a crank case; a crankshaft; a piston slidably mounted in the cylinder and working off the crankshaft; intake and exhaust ports located in the cylinder to permit communication from the interior of the cylinder to the exterior thereof only when the piston is substantially at its lowest stroke position; one wall of the crank case transverse to the longitudinal axis of the crankshaft formed with an aperture, a flexible pressure responsive diaphragm sealing said aperture; a chamber formed interiorly of a housing secured on the exterior wall of said crank case; said diaphragm forming a portion of one wall of said chamber; valve means operable to admit carbureted air to said chamber; a conduit communicating the chamber with the intake port of said cylinder; a pressure relief chamber formed interiorly of a second housing; said second housing positioned exterior of the crank case with said chamber above the normal level of oil in said crank case; said chamber vented to the atmosphere adjacent the top portion of said second housing; a first pipe communicating with said crank case at a point substantially above the oil level in said crank case and connected to said relief chamber in fluid communication therewith at a point substantially above the bottom of said relief chamber; a second pipe communicating with said crank case and connecting with said relief chamber in fluid communication at a point substantially below the point of connection of said first pipe with said relief chamber; said first pipe provided with a check valve adjusted to open when the pressure in the crank case reaches a predetermined maximum; and said second pipe provided with a check valve adjusted to open when the pressure in the crank case falls below a predetermined minimum.

**2,773,490**
**HIGH EXPANSION, SPARK IGNITED, GAS BURNING, INTERNAL COMBUSTION ENGINES**
**Ralph Miller, Milwaukee, Wis.**
**Application September 23, 1952, Serial No. 311,032**
**16 Claims. (Cl. 123—75)**

1. In a gas-fueled, spark-fired internal combustion engine adapted to operate under varying loads, a valve-and-port mechanism for the cylinders of the engine for the admission of fresh air and the expulsion of burnt gases, means for supplying fresh air to the cylinders through at least a part of the valve-and-port mechanism, a gas valve for the cylinders for separately supplying gaseous fuel to mix with the air, means for varying the quantity of fuel supplied in relation to the load on the engine, and a valve actuating mechanism for opening and closing at least a part of the valve-and-port mechanism, including means to entrap a volume of air at full load which is substantially less than the full volumetric capacity of the cylinders, and means for maintaining an approximately constant air-fuel ratio mixture in the cylinders during all loads, said means including a device for timing only the closing of the valve-and-port mechanism so that as the load varies, the quantity of air entrapped, when mixed with the fuel supplied, will result in an approximately constant air-fuel ratio mixture.

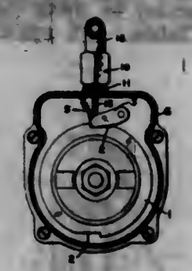
---

**2,773,491**
**PRESSURE CONTROL VALVE**
**Virgil C. Reddy, Farmington, Mich., assignor to General Motors Corporation, a corporation of Delaware**
**Application February 14, 1952, Serial No. 271,519**
**5 Claims. (Cl. 123—120)**



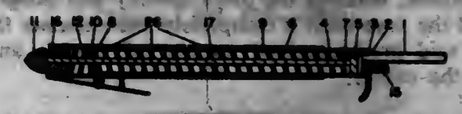
1. In a gas fuel flow regulating means for an engine having an air intake system including an engine driven blower and a lubricating system including an engine driven oil pump, said means including a valve housing having a gas inlet and a gas outlet, cylinders respectively associated with said inlet and outlet, a valve passage connecting said inlet with its associated cylinder, a duct in said housing having one end connected with said inlet associated cylinder, a valve passage connecting the other end of said duct with said outlet associated cylinder, said outlet being in communication with its associated cylinder, a valve seat and a passage closable valve in each said valve passage, elastic members supported by said housing and urging the valves against their seats to effect closure of said passages, stems carried by the respective valves and slidably supported by the housing, a pair of opposed flexible diaphragms dividing said inlet associated cylinder into two compartments, one of said pair of diaphragms having a smaller effective area than the other diaphragm of said pair and being connected to the stem of said inlet associated valve, the compartment adjacent said other diaphragm being adapted for connection to the delivery side of the engine blower, a thrust transmitting spacer between said pair of diaphragms, an elastic member supported by said inlet associated cylinder to cooperate with the blower delivery pressure to transmit thrust to said other diaphragm to open said inlet associated valve in opposition to said gas supply pressure and said first named elastic member, and a flexible diaphragm in said outlet associated cylinder having one of its sides in abutment with the stem of said outlet associated valve, said outlet associated cylinder being adapted on the opposite side of its diaphragm for connection to the delivery side of the engine oil pump.

---



**2,773,492**
**FUEL FEED**
**Emil Richard Klemm, Jr., Lincolnwood, Ill.**
**Application November 5, 1954, Serial No. 467,052**
**6 Claims. (Cl. 123—136)**

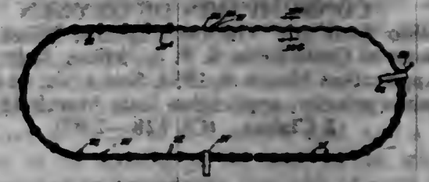
1. Fuel feed means for an internal combustion engine having a carburetor located at an elevation not materially less than the top of said engine, comprising, in combination: a fuel intake conduit located at a level near the bottom of said engine; a fuel pump at substantially the same level as said intake conduit; a riser for conveying fuel from said pump up to said carburetor; and a chamber for segregating vapor associated with said riser and located at the highest point in said riser.



---

**2,773,493**
**AIR OPERATED ENGAGEMENT MEANS FOR IMPULSE COUPLED MAGNETOS**
**George Steven, Kenmore, N. Y., assignor to Worthington Corporation, Harrison, N. J., a corporation of Delaware**
**Application December 5, 1952, Serial No. 324,302**
**5 Claims. (Cl. 123—179)**

1. In combination with an internal combustion engine including a starting air system, a magneto and an impulse coupling for said magneto, of pressure actuated means for engaging said impulse coupling in operative condition upon application of pressure thereto and disengaging said impulse coupling upon release of pressure from said pressure actuated means, and a three-way valve in said air starting system for controlling the delivery of engine starting air to said pressure actuated means.

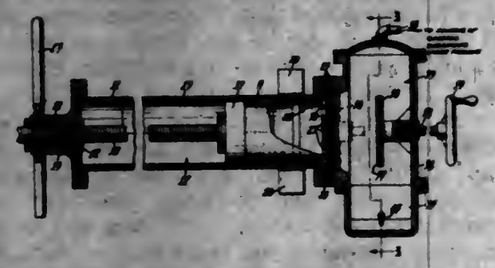


**2,773,494**
**FISHING LINE CASTING GUNS**
**Theodore Lester Thompson and Bernadine G. Thompson, Anaconda, Mont.**
**Application July 6, 1953, Serial No. 366,253**
**2 Claims. (Cl. 124—15)**

1. A fishing line casting gun comprising an air chamber, a sleeve fitted over said air chamber and being rotatable and longitudinally movable thereon, a piston in said air chamber, a shaft engaging said piston, a spring carried by said shaft and engaging said piston, a trigger lock carried by one end of said shaft and having sliding movement longitudinally of said sleeve, a spring abutment carried in said air chamber and engaged by one end of said spring, said sleeve having a longitudinal slot, said sleeve also having spaced lateral slots communicating with said longitudinal slot, a pin carried by said air chamber and adapted to travel in said longitudinal slot and adapted to selectively fit into said lateral slots as said sleeve is moved longitudinally of and rotated upon said air chamber to hold said sleeve in a selected adjusted position on said air chamber, a barrel communicating with said air chamber and projecting therefrom, said barrel having a tapered portion at its inner end, a projectile frictionally fitting in said inner end, a fishing line connected to said projectile and extending longitudinally of the barrel, the barrel having an outer end through which the line extends, and means carried by the air chamber adjacent the barrel for supporting a fishing rod to which said line is attached, said sleeve adapted to compress said spring and retract said piston within said air chamber when said sleeve is moved longitudinally of said air chamber, a spring-pressed trigger on said sleeve releasably engaging said trigger lock to hold the trigger lock in a set position until said trigger is released, and said spring being adapted to expand when said sleeve is released for free sliding movement upon said air chamber to drive said piston toward said barrel and to thereby eject said projectile from said barrel.

---

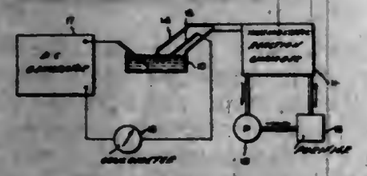
**2,773,495**
**METHOD OF FABRICATING A CABLE VARIETY STONE CUTTING SAW**
**Hubert M. Lefevre, Bonnevil-en-Valois, France**
**Application December 9, 1953, Serial No. 397,126**
**5 Claims. (Cl. 125—21)**



3. That improvement in the fabrication of an endless flexible cable of predetermined length and in the form of a normally straight core and a predetermined number of side by side spiral wire strands around the core, which comprises the following steps: first, cutting the core of the cable from normally straight core stock so that the length thereof is slightly less than the predetermined length of the cable to be formed; second, manipulating the cut core so that it is in the form of a loop and has the ends thereof disposed in opposed but spaced apart relation; third, cutting from conventional wire cable stock having the same number of spiral wire strands as the cable to be formed a section of cable the length of which is substantially equal to the desired total length of the cable multiplied by the number of spiral strands that the complete cable is to have; fourth, unwinding

one of the strands of the cut section of conventional wire cable stock in order to provide a single pre-set spiral wire piece; fifth, straightening the extremity of one end of the piece; sixth, positioning the straightened extremity of the piece in the space between the ends of the core; and seventh, winding the piece spirally and progressively around the core until it completely encompasses the core, forms said predetermined number of strands and completes the cable.

---



2,773,496
**MACHINE FOR MELTING AND FEEDING SOLIDIFIED MATERIALS**
John D. Czarnecki, Oak Park, Ill., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application December 21, 1951, Serial No. 262,861
5 Claims. (Cl. 126—343.5)

1. A machine for feeding and melting a solid block of thermoplastic material comprising in combination a hollow cylinder for holding the material, a grid element disposed adjacent an open end of said cylinder in communication therewith, said end being constricted to engage tightly around the periphery of said block of material disposed in said end to form a seal between said grid element and the portion of said cylinder remote from said grid element, said grid element having a plurality of discrete passages therethrough, means in said cylinder for advancing said material against said grid element, means for heating said grid element to melt said material to a flowable condition so that it will flow through said passages for subsequent use, and cooling means surrounding and in contact with said cylinder adjacent said constricted end to keep portions of said material remote from said grid element in a solid state.

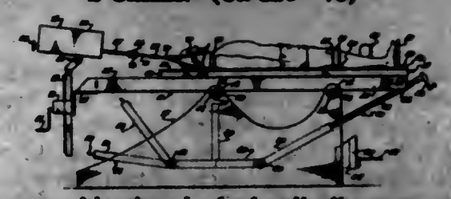
2,773,497
**METHOD AND APPARATUS FOR MEASURING CONSUMPTION OF OXYGEN**
Costantino Amdi and Vittorio Caprare, Milan, Italy, assignors to Carlo Erba, S. P. A., Milan, Italy, a firm
Application March 8, 1954, Serial No. 414,816
Claims priority, application Italy March 10, 1953
2 Claims. (Cl. 128—2.07)

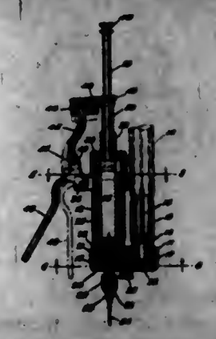
1. Apparatus for the determination of oxygen consumed by an oxidation variable process in biological substrates comprising an electrolytic dissociation cell, a collection chamber around the oxygen-producing electrode of said cell immersed in the cell electrolyte to seal said collection chamber, a constant temperature chamber in which said oxidation process occurs, a conduit connecting said collection chamber with said constant temperature chamber, and means for measuring the quantity of electricity consumed by said cell.



2,773,498
**KINESITHERAPY DEVICE**
Louis F. Hunsaker, Teaneck, N. J.
Application July 31, 1953, Serial No. 371,590
5 Claims. (Cl. 128—33)

4. A kinesitherapy device including, in combination, a motor, a main drive shaft driven by said motor, a plurality of worms on said shaft, a plurality of intermediate drive shafts each having a worm gear engaging one of said worms, a multiplicity of body contacting applicators located on each side of said main shaft and in spaced relation one to the other along the length of said main shaft, an eccentric means driven by each of said intermediate shafts and driving one of said applicators in a predetermined path, individual clutch means for phasing each of said applicators relative to said main shaft, and dial means for indicating the phase condition of each applicator.

---



2,773,499
**HYDRAULICALLY ACTUATED INTERMITTENT DRIVE IN PHYSICAL THERAPY APPARATUS**
Harald H. zur Nieden, South Pasadena, Calif.
Application January 27, 1956, Serial No. 484,476
2 Claims. (Cl. 128—75)

1. In a combination in hydraulically actuated intermittent drive in physical therapy apparatus reciprocating means adapted to be connected to a patient for producing pulling and releasing movements, said reciprocating means including pressure fluid responsive means, a valve for shifting fluid flow, solenoid means for shifting said valve; and pressure switches sensitive to the pressures in said reciprocating means for energizing said solenoid means and therewith shifting said valve.

---

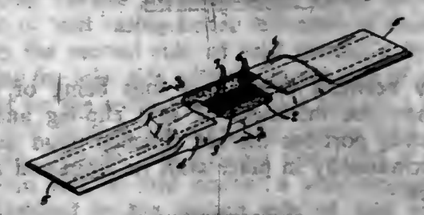
2,773,500
**INTRAOSSEOUS FLUID INJECTION INSTRUMENT**
Harold S. Young, Washington, D. C.
Application January 26, 1955, Serial No. 484,136
9 Claims. (Cl. 128—218)

1. A dental instrument for effecting intraosseous fluid injections, comprising a body member having a chamber adapted to house a receptacle containing the fluid to be injected; a shaft rotatably and non-slidably journaled in said body member below said chamber and provided with a longitudinal passage communicating with the chamber; a drill element carried by said shaft and having a longitudinal duct communicating with said shaft passage; means for rotating the shaft, whereby said drill element may penetrate a bone to the medullary section thereof; and means in said chamber engageable with a portion of a fluid-containing receptacle disposed therein and operable by the hand holding the instrument immediately upon said penetration of the drill element to said bone section to expel fluid from said receptacle and force it through said shaft passage and drill duct into said bone section.

---

2,773,501
**DRILL ELEMENT FOR EFFECTING INTRAOSSEOUS FLUID INJECTIONS AND THE LIKE**
Harold S. Young, Washington, D. C.
Original application January 26, 1955, Serial No. 484,136. Divided and this application March 10, 1955, Serial No. 493,393
1 Claim. (Cl. 128—221)

An anti-clogging tubular dental drill element for use in sequentially effecting penetration of the hard outer layer of a bone and the passage of a fluid to or from the medullary section thereof, said drill element comprising a body member arranged for ready attachment to a power driven rotating means, said body member having a stem extending axially therefrom, the terminal portion of which stem is tapered to a point and is provided with a beveled flat face extending at an acute angle to the axis of the stem and the lateral boundaries of which face provide rotationally operative bone-cutting edges extending from said point, said stem also having an axial fluid duct provided with a sharply angular terminal portion adjacent said point which opens through said flat face between said cutting edges, such terminal duct portion extending substantially perpendicularly to said face whereby to exclude drill cuttings from the duct.



---

2,773,502
**DEVICE FOR TREATING ALIMENTARY TRACT**
Arthur L. Kaslow and James J. Saporito, Los Angeles, Calif.
Application December 21, 1953, Serial No. 399,304
6 Claims. (Cl. 128—260)

1. In a device for positioning medicine at a predetermined zone in the alimentary tract; a weighted carrier; a medicinal pellet having a hole therethrough, whereby said pellet may be strung on said carrier; and means associated with said carrier having coaction with a strung pellet to determine its location on the carrier depending upon the diameter of said hole.

2,773,503
**ABSORBENT PRODUCT**
Robert Nelson Brownlee, Trenton, N. J., and Hector Wallace Griswold, Longmeadow, Mass., assignors to Personal Products Corporation, a corporation of New Jersey
Application September 3, 1954, Serial No. 454,152
6 Claims. (Cl. 128—290)

1. A sanitary napkin comprising an absorbent pad, a gauze web in the form of a narrow reinforcing strip adjacent the pad and having ends extending beyond the ends of the pad, a separate woven fabric covering said pad and said web and having ends substantially coextensive with the ends of the gauze web, the threads of the web being secured at a multiplicity of points where they intersect each other whereby the gauze web has imparted to it the characteristic of resisting those forces encountered during conditions of normal use which cause a gauze web to distort.

---

2,773,504
**LOOSE-LEAF BINDERS**
Daniel Donald McGervey, Pittsburgh, Pa.
Application December 30, 1952, Serial No. 328,648
2 Claims. (Cl. 129—41)

1. A loose-leaf binder comprising two folds each formed by turning material back on itself to produce a bend along one edge of each fold, one fold being at least twice the width of the other fold, a cover sheet for each fold, fastener means passing through each fold and its cover sheet to secure it with its opposite edge along one edge of its cover sheet, a back section hinged to said cover sheets along said one edge thereof and extending therebetween, a plurality of leaf holding flexible binding straps each materially longer than the cross dimension of said back section, said straps secured in spaced relation along the bend of the narrow fold, and a keeper in the form of an opening at the bend of the wide fold and in alignment to receive the free end of each flexible binding strap attached to the narrow fold to permit the free end of said straps to slide through said keepers when the binder is opened and closed.

---

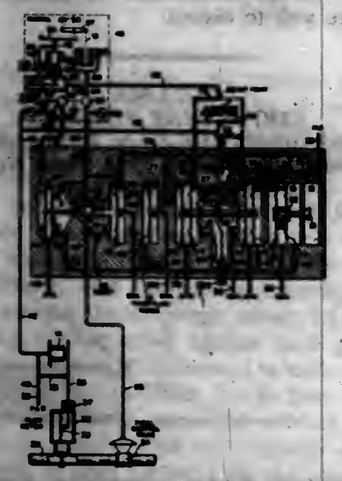
2,773,505
**HAIR CLIP**
Jacob Goodman, Brooklyn, N. Y., assignor to Delaware Company, Inc., a corporation of Delaware
Application October 4, 1954, Serial No. 460,065
1 Claim. (Cl. 132—46)

A hair clip comprising a spring clip having a pair of legs connected at one end by a loop, and a face member, said member having an anchor block at its front end having a recess therein into which the front end of one clip-leg fits tightly, a stop at the other end of the face

member against which the loop of the clip rests to prevent sliding movement of said member on the clip-leg, said face member having at its sides, adjacent the stop, a pair of lugs spaced apart a distance to receive said clip-

leg tightly between them, said lugs being of a height greater than the thickness of said clip-leg and having the projecting portions thereof clinched upon said leg to hold it permanently in place with its front end anchored in the block.

---



2,773,506

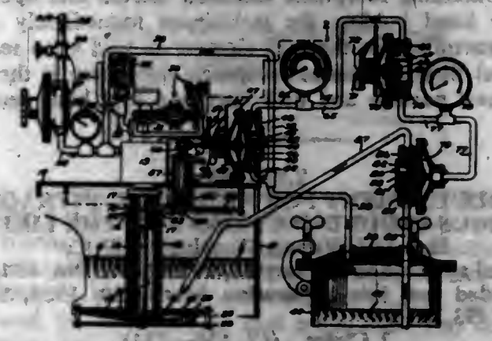
**ELASTIC-FLUID-PRESSURE-ACTUATED MEANS FOR ADJUSTING THE PROPORTIONAL BAND OF A CONTROLLER**

William E. Bauer, Palmyra, N. J., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

Application December 28, 1950, Serial No. 283,151

4 Claims. (Cl. 137—86)

1. Fluid-operated means for adjusting the proportional band of a controller, including, a fluid-operated motor, mechanism exercising the control action of said controller under the control of said motor in response to the variations in the measured variable, a pressure-reducing fluid-conducting network, a source of fluid pressure connected to said network to furnish a pressure variable in proportion to the variations in the measured variable and under the control of said motor and said mechanism, a manually adjustable restriction connected in said network and located between said source and said motor and comprising a stationary cylindrical conduit of the order of 0.0625 inch in internal diameter and a frusto-conical needle having its minimum diameter smaller and its maximum diameter larger than the internal diameter of said conduit and movable axially of said conduit, the angle of taper of said needle being of the order of 2 degrees and 22 minutes, the resistance of this restriction to fluid flow being substantially independent of the flow through it, a reference source of fluid pressure connected to said network, and a second restriction connected in said network and located between said reference source of pressure and said motor and comprising a fixed capillary tube of the order of 0.0085 inch inside diameter and ⅝ inch in length, the pressure drop across said second restriction varying as a non-linear function of the flow through said second restriction because of the tendency of the restriction to change the flow from laminar to turbulent.



2,773,507

**VISCOSITY CONTROL SYSTEM**

Edward O. Norris, Westport, Conn.

Application October 4, 1954, Serial No. 460,159

5 Claims. (Cl. 137—92)

2. A device responsive to changes in viscosity of a liquid, comprising a member mounted to move in said liquid, an independently movable member disposed in said liquid within the range of viscous influence of said first member and movable in response to viscous drag produced by movement of said first member, means constraining said second member to produce a force proportional to said viscous drag, means including a pressure regulating valve responsive to variations in said force for producing a fluid pressure which varies as a function of said force, a source of viscosity control liquid to be added to said first liquid, means including a valve to control the flow of said viscosity control liquid into said first liquid, and means responsive to a predetermined change in said fluid pressure to open said last valve whereby viscosity control liquid is added to said first liquid to correct the viscosity change thereof.

---

2,773,508

**OSCILLATOR VALVE**

Donald E. Bechett and William N. Bechett, Wilmington, and Wayne T. Cranmell, Dayton, Ohio, assignors to Bechett-Harcum Co., Wilmington, Ohio, a corporation of Ohio

Application April 28, 1953, Serial No. 351,556

10 Claims. (Cl. 137—106)

1. An oscillator valve comprising the combination of three duplicate spool valves each including a housing having a longitudinal bore therethrough, five annular ports in laterally spaced relationship disposed along and in open communication with said bore, a valve stem reciprocably mounted in said bore, said stem including a pair of valving pistons for opening and closing the second and fourth of said annular ports, and a second pair of pistons one on either side of said first pair of pistons and beyond the first and fifth annular ports, with means for mounting said valves in laterally spaced end-to-end relationship and providing an individual chamber for each valve with individual ports at opposite ends of the bore of each valve and in open communication with the respective outer faces of the second pair of pistons of each of said valves, means inter-connecting the third annular ports of each valve to a common manifold, means interconnecting the first and fifth annular ports of each valve to a second common manifold, the second and fourth annular ports of the first of said three valves terminating in individual cylinder ports provided in their respective valve housing, means interconnecting the second annular port of the first valve with the port at the end of the third valve adjacent the first valve, means inter-connecting the fourth annular port of the first valve with the end port of the third valve

remote from the first valve, means inter-connecting the port at the end of second valve adjacent the first valve with the fourth annular port of the third valve, means inter-connecting the port at the end of the first valve remote from the second valve to the fourth annular port of the second valve, means inter-connecting the port at the opposite end of the first valve with the second annular port of the second valve, means inter-connecting the port at the end of the second valve adjacent the third valve in communication with the second annular port of the third valve, and means engaging opposite ends of the stem of the third valve for normally and yieldably urging said stem to a central position with its valving pistons closing the second and fourth annular ports thereof.

2,773,509

**HYDRAULIC JACK RESERVOIR**

Frank J. Jakoubek, Elmwood Park, Ill., assignor to Star Jack Company, Inc., River Grove, Ill., a corporation of Illinois

Application November 19, 1953, Serial No. 393,144

11 Claims. (Cl. 137—587)

1. Means for preventing the discharge of hydraulic fluid through the air vent opening leading to external atmosphere from one end of the annular hydraulic jack reservoir space formed between spaced inner and outer tubular members as a result of hydraulic fluid charging into said annular space under pressure through an opening located at the end opposite said air vent, said means comprising a plurality of convolutions of different sizes positioned in the space between the outer wall of the inner tubular member and the inner wall of the outer tubular member, and between the air vent and the hydraulic fluid opening.

2,773,510

**MANUALLY OPERATED PILOT CONTROLLED REGULATING VALVE**

Thomas R. Black, Port Isabel, Tex.

Application December 11, 1953, Serial No. 397,567

2 Claims. (Cl. 137—614.14)

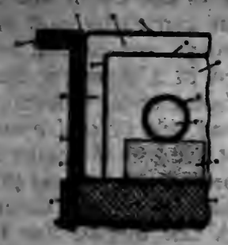
1. A fluid flow regulating valve comprising: an elongated valve casing having an inlet side and outlet side; a closure member disposed between said inlet and outlet sides; a piston reciprocably mounted in said casing to the outlet side of said closure; a fluid conduit formed through said closure to permit fluid communication between the inlet and outlet sides of said casing and between the inlet side of said casing and a first side of said piston; valve means carried by said piston for opening communication through said conduit when said piston is reciprocably moved in a direction from outlet toward inlet side of said casing under influence of fluid pressure acting on the second side of said piston; a by-pass line connecting the inlet side with the outlet side of said casing at a point on the second side of said piston; a ball check valve in said by-pass line normally closing fluid flow communication through said by-pass line from said inlet to said second side of said piston; a vent opening in said casing disposed to the second side of said piston; and manually actuatable means for simultaneously closing said vent opening and opening said check valve; said manually actuatable means comprising rotatable means extending exteriorly of said casing, a ball unseating member mounted reciprocably in said casing for reciprocable movement in a first direction to cause unseating and opening of said ball check valve end in a second direction to permit seating and closing of said ball check valve, and means connecting said manually rotatable means with said ball unseating member for converting rotary movement of the former to reciprocable movement of the latter.

---

2,773,511

**PRESSURE ACCUMULATOR**

Jean Mercier, New York, N. Y.



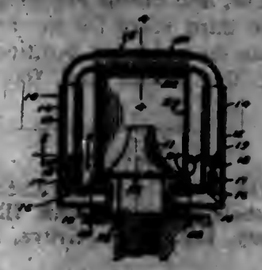
Application December 23, 1952, Serial No. 327,602

3 Claims. (Cl. 138—30)

1. A pressure accumulator comprising a pair of substantially cup-shaped shells, each having a laterally extending rim at the mouth thereof and a port through the wall thereof, a deformable partition of resilient material in the shape of a bladder having its periphery positioned between said rims and normally extending in one of said shells, said rims extending laterally beyond the periphery of said partition, said extending portions having a plurality of openings therethrough, a bolt extending through pairs of aligned openings in said rims, a nut screwed on the ends of each of said bolts, whereby when said nuts are tightened the rims will be drawn together to clamp the periphery of said partition therebetween, an annular supporting member of flexible material affixed to said partition, said member having a portion thereof extending laterally beyond the clamped periphery of said partition and a portion extending along the wall of said partition near the clamped portion thereof to limit the bending of the portion of said partition adjacent said periphery when the partition is expanded and contracted during use of the accumulator, the portion of said annular supporting member extending laterally beyond the clamped periphery of said partition having a plurality of openings therethrough, through which said bolts extend to prevent inward displacement of said periphery.

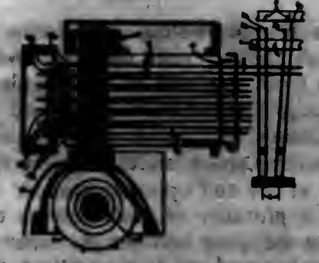
2,773,512
METHOD OF INSTALLING UNDERGROUND HEATING PIPE SYSTEMS
Morris S. Bank, Miami Beach, Fla.
Application June 14, 1955, Serial No. 515,549
7 Claims. (Cl. 138—40)

1. In the process of laying and heat-insulating one or more pipes for conducting heated fluid in a ground trench including laying a concrete base at the bottom of the trench, mounting one or more heat-insulated pipes longitudinally in said trench on said base and erecting form-members along and extended above said concrete base, the novel combination of steps of attaching a liner of asphaltic impregnated composition material to the form-members, applying a membrane of several plies of tarred felt to the concrete base and liner, pouring a heat-insulating concrete in the form provided by said base and form-members around and enclosing the pipes, allowing said insulating concrete to set and applying a waterproof cover on the top of the insulating concrete.



2,773,513
SUBTERRANEAN INSULATED CONDUIT UNIT HAVING SPACER CHANNEL BETWEEN PIPES
Alexander H. Isenberg, Woodside, Calif.
Application December 22, 1953, Serial No. 399,781
4 Claims. (Cl. 138—65)

1. A thermal and moisture insulated conduit unit including a main conveyor pipe, an enclosing body of thermal insulation circumferentially and longitudinally thereof, said insulation having a gap in its circumference providing a channel longitudinally of the pipe and open radially to the conveyor pipe, a tracer pipe of smaller diameter than the conveyor pipe and spaced parallel to the conveyor pipe, an enclosing body of thermal insulation circumferentially and longitudinally of the tracer pipe and having an open space in its circumference communicating with said gap in the other insulation body, a spacer channel member in said gap bearing on the tracer pipe and extending to the conveyor pipe, an outer casing spaced from and enclosing the said thermally insulated pipes, and a moisture-impervious layer between the thermal insulation and the outer casing.



2,773,514
ACCESSORY FOR A GREASE GUN FITTING
Elmer J. Campopiano, Saratoga Springs, N. Y.
Application July 6, 1954, Serial No. 441,299
4 Claims. (Cl. 138—89)

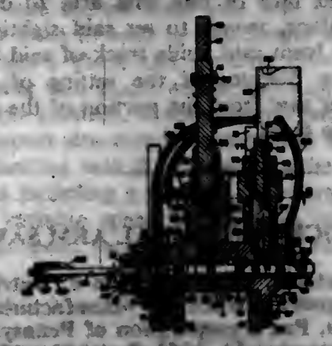
2. A moisture, dirt and dust proof cap for a grease gun fitting comprising a pair of elongated tubular members each having an end portion thereof bent laterally at substantially right angles to the longitudinal axis of said members, said end portions of said tubular members being adapted for pivotal connection with opposite sides of said fitting, an inverted substantially U-shaped member having the arms thereof telescoped within the other ends of said tubular members, a helicoidal spring disposed within each of said tubular members and connected with each of said tubular members and the adjacent ends of said tubular arms whereby said U-shaped member is constantly biased for relative movement toward said one end of said tubular members, an elongated collar mounted

for rotation on the base of said U-shaped member, an elongated substantially cylindrical cap having opposed open and closed ends, said cap being positioned between said tubular members and their respective adjacent tubular arms, said closed end of said cylindrical cap having a depressed portion extending diametrically thereacross and adapted to receive said sleeve therein, means securing said sleeve to said closed end of said cylindrical cap, and a substantially flexible sealing ring fixed to the open end of said cylindrical cap.

2,773,515
VERDOL JACQUARDS FOR WEAVING LOOM
Olivier Dalle, St.-Cyr-en-Mont-d'Or, France, assignor to Societe a responsabilite limitee, Societe des Mecaniques Verdol, Lyon, France, a French limited liability company
Application November 12, 1953, Serial No. 391,601
Claims priority, application France November 28, 1952
7 Claims. (Cl. 139—99)

1. The herein-described method for the actuation of the movable bars of a Verdol jacquard, which consists in imparting to said bars first, a downward vertical movement while they are at their rearmost position to ensure selection of the feeler needles and of the pusher rods associated thereto; second, a horizontal forward movement to ensure actuation of the pusher rods and of the driver needles associated to the hooks of the jacquard; third, a vertical upward movement to raise the feeler needles from the pattern paper band of the jacquard; and fourth, a horizontal backward movement to release the driver needles.

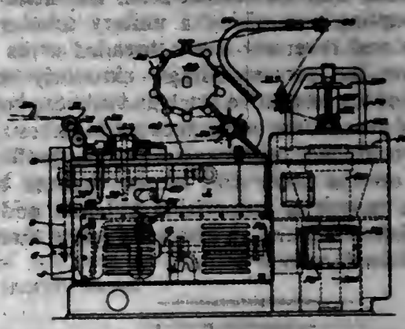
2,773,516
LOOM HARNESS
Frank H. Kaufmann, Huntingdon Valley, Pa., assignor to Steel Heddle Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
Application November 1, 1951, Serial No. 254,230
6 Claims. (Cl. 139—91)



1. In a loom harness frame the means for securing connector devices to a rail of the harness frame which comprises the provision on each of said devices of a shank having a threaded portion positioned within the rail, a portion located adjacent the edge of the rail of transversely flattened cross-section thereby to provide a portion of less thickness than the other portions

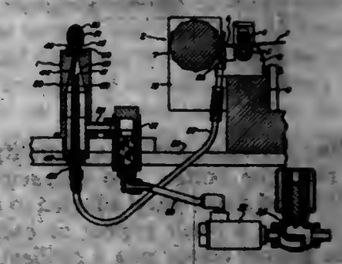
of the connector device, and a plate member of a width no greater than the thickness of the rail mounted on the edge of the rail and having one end portion provided with an open end slot engaging the flattened portion of the connector device.

2,773,517
LIQUID PICKING MECHANISM
Leslie J. Hooper, Holden, and Clarence R. Kronoff, Worcester, Mass., assignors to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts
Application August 3, 1953, Serial No. 371,772
27 Claims. (Cl. 139—142)



3. In liquid operated picking mechanism for a loom having a shuttle to be picked, hollow means defining a chamber containing liquid, a picking actuator for the shuttle comprising a plunger slidable on said hollow means having a part thereof in the chamber, a seat on said hollow means for said part of the plunger, control mechanism to move the plunger to cause said part thereof to move against said seat, compressing means effective subsequent to seating of said part of the plunger on said seat to compress the liquid in said chamber and cause the liquid due to the pressure thereof on the plunger to hold said part of the plunger against said seat, and release means operative while said liquid is compressed to move said part of the plunger away from said seat, whereupon the liquid due to the compression thereof acts on said part to move said actuator to effect picking of the shuttle.

2,773,518
QUILL ASSEMBLY
Wallday B. Ewing, Grand Rapids, Mich., assignor to Ewing Development Company, Grand Rapids, Mich., a corporation of Michigan
Application September 9, 1952, Serial No. 308,663
2 Claims. (Cl. 140—30)

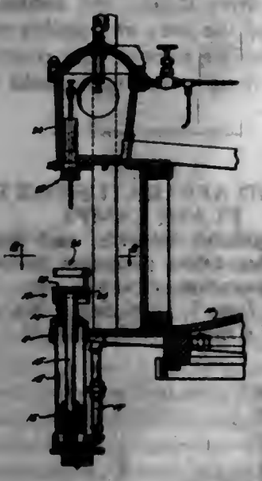


1. A quill assembly for a warp weaving machine having a plurality of wire strands passing through said quill assembly for feeding to said machine comprising: a plurality of guide and discharge rollers mounted in said quill at the discharge end thereof; a plurality of groups of freely rotatable rollers mounted in said quill rearward of said guide and discharge rollers, one group for each of said wire strands; each of said groups including several rotatable elements arranged longitudinally of said quill whereby each of said wire strands are successively looped around each of said rotatable elements of one of said groups; the diameters of said rotatable elements being such as to continuously work the wire as it is drawn through said quill to straighten the wire and create back tension.

2,773,519
BARB WIRE MANUFACTURE
Neil J. Ramsey, Euclid, Ohio, assignor to Wean Equipment Corporation, Euclid, Ohio, a corporation of Ohio
Application August 31, 1951, Serial No. 244,606
8 Claims. (Cl. 140—60)

1. Twisting and coiling mechanism comprising a yoke rotatable about a vertical axis, means for continuously delivering material to be twisted and coiled to a point in line with the axis of the yoke, a coiling member rotatable within the coaxial with the yoke receiving and holding a spool for coiled material, means on the yoke receiving the wire from the delivery means and directing it to the coiling member, and drive means and connections between the drive means and the yoke and coiling member whereby the yoke and coiling member are rotated to twist the material and coil it upon the spool held by the coiling member.

2,773,520
METHOD AND APPARATUS FOR LOADING FLASH LAMPS
Paul A. Doll, Highland Heights, and James J. Lazzo, Cleveland Heights, Ohio, assignors to General Electric Company, a corporation of New York
Application June 7, 1954, Serial No. 434,918
17 Claims. (Cl. 141—5)



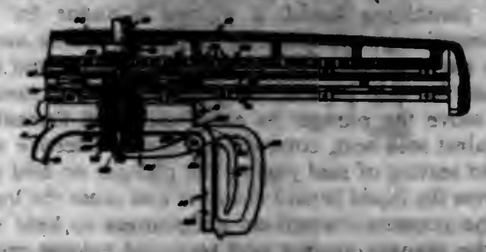
1. The method of feeding fine strands of material into and distributing them within a container having an opening therein which comprises entraining the material in a gaseous fluid, guiding the entrained material toward the opening in the container, bleeding off the fluid at a point near the opening in the container and in a direction sharply away from the interior of the container to cause the entrained material by its inertia to enter the container through the opening, and directing a low velocity air jet into the container concurrently with the injection of the said strands thereinto to thereby fluff out the strands upon entry into the container.

2,773,521
COUPLING FOR SQUEEZE BOTTLES
Nels Leonard Persson, Tujunga, Calif.
Application March 2, 1954, Serial No. 413,567
6 Claims. (Cl. 141—5)

1. A coupling for stock containers and squeeze bottles whereby the latter may be refilled from the stock container, said coupling comprising a unitary tubular element interiorly and reversely screw-threaded at its ends to accommodate the correspondingly exteriorly screw-threaded necks of the respective stock and squeeze bottles, the outer end of the squeeze bottle neck having a restricted opening, said restricted opening comprising perforated disc mounted on the outer end of the squeeze bottle neck, said disc mounting comprising a liquid and air-tight sealing relationship and an exteriorly screw threaded closure element for the stock bottle.

2,773,522
RESILIENT BOTTLE GRIPPER FOR FILLING MACHINE
George L. N. Meyer, Milwaukee, Wis., assignor to Geo. J. Meyer Manufacturing Company, Cudahy, Wis., a corporation of Wisconsin
Application March 15, 1954, Serial No. 416,190
7 Claims. (Cl. 141—165)

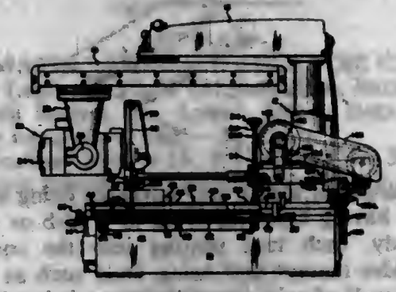
1. A bottle filling machine, having a plurality of stirrups adapted to raise the bottles into engagement with filler valves for filling and a star wheel adapted to move the bottles on to the stirrups, a bottle gripper on each of said stirrups, said bottle gripper comprising a resilient member adapted to engage a bottle in gripping engagement and center the same below a filler valve.



2,773,523
GUIDE DEVICE FOR PORTABLE POWER SAWS
Lloyd Melvin Hopin, Keyport, N. J.
Application April 29, 1952, Serial No. 284,857
5 Claims. (Cl. 143—6)

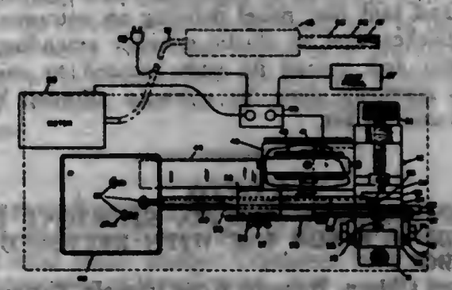
1. The combination of a saw guide and a sighting gauge in which the saw guide that is moveable with relation to the work to be cut includes a first and second arm, said first and second arms pivotally connected at the adjacent ends of said arms, a third diagonal arm pivotally connected to the first arm and adjustably attachable through a slot in said arm to the second arm, said first arm provided with an upturned face and said second arm provided with a downturned face, said upturned face providing a guide track for a power saw, a clamp on the second arm that is provided with means to be secured to the material to be cut, said sighting gauge being a pivotally moving normally retracted sighting

gauge that is supported by said first arm, said sighting gauge provided with a sighting blade that may be moved to any position perpendicular to and horizontally along said gauge to indicate a predetermined spaced position from the upturned face of said first arm to determine the saw cutting plane, means to set said sighting blade the same distance from said guide track of said first arm to agree with the distance of the setting of the saw blade of the power saw from the portion of the saw that rides on said guide track.

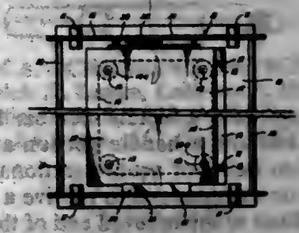


2,773,524
SAFETY LOCK FOR RADIAL ARM SAWS AND THE LIKE
Ewald Schatz, Leetonia, Ohio, and Paul E. Butzin, Pittsburgh, Pa., assignors to Rockwell Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application September 21, 1953, Serial No. 381,269
3 Claims. (Cl. 143—47)

1. In a power tool, a track arm; a carriage mounted on said track arm for longitudinal movement therealong; a yoke secured to said carriage for rotary movement about an axis perpendicular to said track arm and adapted to operatively support a cutter head; grip means on said yoke for manually moving said yoke and carriage as a unit along said track arm; an elongated bar longitudinally fixed to said track arm having a plurality of circular apertures therein with their centers along a line intersecting and substantially normal to said perpendicular axis; a locking plunger slidably mounted on said yoke and carriage for movement along a line coincident with said perpendicular axis irrespective of the angular position of said yoke, said plunger including a circular portion rigid therewith adapted in one position of the plunger to selectively enter one of said apertures and immobilize said carriage; means normally biasing said locking plunger to said one position; and means operatively associated with said handle and locking plunger and selectively operable to move the locking plunger out of said one position.



2,773,525
RADIAL ARM SAW AND POWER FEED THEREFOR
Ewald Schatz, Leetonia, Ohio, assignor to Rockwell Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application August 27, 1952, Serial No. 306,561
13 Claims. (Cl. 143—55)



2. For use in combination with a wood working machine characterized by the association of a power driven unit with a planar work support table, a power feed unit comprising a rigid support structure pivotally mounted at and on an axis substantially parallel to the rear edge of the work support table and having at each end a hollow arm projecting over the work support table, a shaft journalled in each of said hollow arms and projecting outwardly of said hollow arms over said table, a workpiece feed roller fixed to each of said shafts outwardly of said hollow arms, a chain and sprocket drive mechanism interconnecting said shafts within said support structure for concomitant rotation, a drive motor mounted exteriorly of said support structure on one of said arms, and a drive train connecting said drive motor to the adjacent one of said shafts including a variable speed transmission of the infinitely variable speed V-belt drive type to provide a continuous speed variation within the range of speed adjustment.

2,773,526
SCREW DISPENSING AND AFFIXING MECHANISM
Arthur U. Ealick, Lenawee, Mich., assignor, by direct and mesne assignments, to Ealick Associates, Inc., Detroit, Mich., a corporation of Michigan
Application May 26, 1955, Serial No. 511,357
9 Claims. (Cl. 144—32)

3. A screw dispenser for conveying and affixing a screw to a power driven screw driver of the type comprising a tubular shaft, a bit assembly yieldingly mounted therein and projecting therefrom, said bit assembly comprising a pair of resilient bits relatively longitudinally movable with respect to each other and in contact for at least a part of their length and sprung apart at their free ends, means yieldingly maintaining one of said bits in such position that its free end projects slightly beyond that of the other, said dispenser having a fixture for supporting said screw with the head thereof facing upwardly, and means operable to force both said bits into the kerf of the screw when said rotating power driven screw driver is forced down onto said screw.

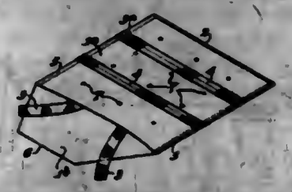
2,773,527
WORK PIECE MOUNTING APPARATUS
Egmont S. Smith, Houston, Tex., assignor to B. & B. Engineering & Supply Company, Inc., Houston, Tex., a corporation of Texas
Application January 5, 1954, Serial No. 402,271
13 Claims. (Cl. 144—145)

1. An assembly for use with apparatus for shaping a surface of a rigid work piece, said assembly comprising in combination, a support carrying a platform for supporting a work piece having a surface to be shaped, a frame including template means having edges contoured to a constant radius curvature, means for removably receiving said frame upon said support with said contoured edges in selected orientation relative to said platform, said latter-mentioned means including bearing portions carried by said support providing at least three bearing points for said frame which determine the position of said contoured edge relative to said platform, and means on said template means for fixedly clamping said work piece therebetween.

2,773,528
KEYHOLE SAW WITH ROTARY ADJUSTMENT FOR THE BLADE
Donald Gringer, New York, N. Y., assignor to Louis Gringer, New York, N. Y.
Application October 31, 1955, Serial No. 543,751
3 Claims. (Cl. 145—31)

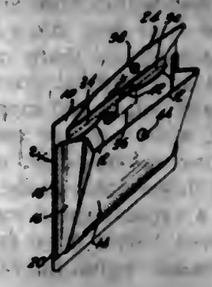
1. A keyhole saw, including a handle having a hollow open end, a pair of mutually mating clamping members fitting in the open end in clamping position for clamping a saw blade between them with the blade extending from the handle, one clamping member having a transverse groove in its inner surface and the other clamping member having a corresponding rounded end on its inner surface rockably fitting into the groove to form a fulcrum for said other clamping member to hinge upon the one clamping member to open and close both clamping members for releasing and clamping the saw blade therebetween, means for withdrawing said clamping members into the end of said handle to retain said saw blade in position which includes having the handle hollow rearwardly of the hollow open end thereof and formed with side slots, an elongated shank connected to the one clamping member and extending into the rearward hollow portion of said handle with a thread upon at least a portion of said shank, a knurled nut mounted upon the threaded portion of said shank and extends to the exterior of said handle through said side slots, a partition wall transversely disposed within the handle and having a hole through which the shank from the one clamping member extends in effective position to dispose the knurled nut rearwardly of said partition wall, the inner end of the open end of the handle having a polygonal cross section, and the mentioned one clamping member at the junction of the shank therewith having a corresponding polygonal head fitting said inner end of said open end of the handle in a plurality of angularly different positions.

2,773,529
**HAND TOOL WITH ANGULARLY ADJUSTABLE BIT**
Victor A. Valenti, Winfield Park, N. J.
Application December 29, 1954, Serial No. 478,235
3 Claims. (Cl. 145—50)



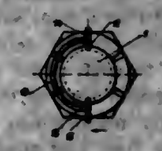
1. A tool comprising a handle member having a shank portion at one end and a handle portion at its other end, the shank portion being of square sectional configuration and relieved at its extreme end to receive a tool bit, a tool bit removably fitted to the relieved end of the square shank portion, said bit having a corresponding square shank at its inner end and relieved complementary to the relieved end of the holder shank so that the two parts when they are assembled together in alignment form the full sectional configuration of the shank of the holder, interfitting means between said relieved end portions of the removable tool bit and the shank adapted to constrain the parts against separation longitudinally but normally permitting separation thereof laterally, a chuck assembly slidably mounted on the shank of the holder and completely surrounding same, said assembly comprising an inner part having an axial bore of the corresponding shape and size slidingly to receive the squared shank of the holder and to telescope said interfitting means and the joint made thereby with an assembled tool bit, and an outer part threadably connected to the inner part, the said inner part being split a portion of its length to form clamp elements operative on relative rotation of the outer part in a clamping direction to clamp tightly upon the flattened faces of the square shank of the holder and effective to transmit torsional forces applied to the handle directly to the squared shank of the tool bit independently of the relieved portions at the juncture of the tool bit with the holder shank portion.

2,773,530
**COMBINATION MASHER AND FORK**
Cornelius D. Sullivan, West Long Branch, N. J.
Application March 24, 1953, Serial No. 344,325
1 Claim. (Cl. 146—204)



A child's eating implement, for mashing, picking up and carrying food, comprising an elongate handle, a shank integral with the handle and extending lengthwise thereof, a furcated functional part integral with the shank and extending lengthwise thereof and consisting of spaced, tapered, elongate branches extending lengthwise of the handle and shank, spaced cross pieces connecting the branches intermediate the ends of the latter, and a guard across the outer ends of the branches, the functional part being concave lengthwise only, on its front or upper face, and convex lengthwise only, on its back, the mentioned branches having smooth front, back and side surfaces.

2,773,531
**ENVELOPE-LIKE CONTAINERS**
Clarence La Verne Johnson, London, England
Application February 28, 1955, Serial No. 491,074
Claims priority, application Great Britain February 26, 1954
1 Claim. (Cl. 150—2.1)



An envelope for a pad, said envelope being made from fabric and having tapes for tying to a limb or other part of the body, each tape passing into the container at opposite sides thereof and being fixed such as by stitching to one wall of said container where it is within same.

2,773,532
**PURSE**
Daniel J. Nash, Jersey City, N. J., assignor to Nash Inc., Jersey City, N. J., a corporation of New Jersey
Application February 8, 1954, Serial No. 408,791
4 Claims. (Cl. 150—37)

3. A purse of the character described comprising a rear panel, a front panel secured to said rear panel along its side and lower edges to define a pocket therewith, a closure flap having a rear edge, laterally spaced portions of said closure flap rear edge being secured to said rear panel along the upper part of said pocket, an elongated portion of said flap rear edge between said laterally spaced portions being detached from said rear panel, the space between said flap rear edge detached portion and said rear panel defining an entrance throat to said pocket, and an elastic member extending along said throat and having its ends secured to said rear panel to normally close the entrance afforded by said throat to said pocket.

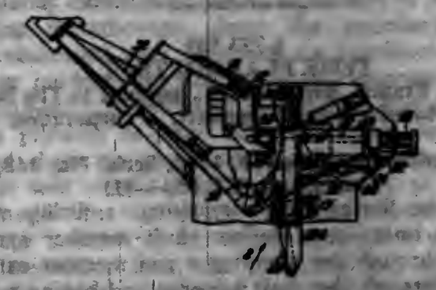
2,773,533
**SUBSTANTIALLY U-SHAPED, RESILIENT LOCKING DEVICE FOR USE WITH RECESSED NUT AND BOLT**
Helmut Ohlsen, Welsede, Kreis Hameln, Pyrmont, Germany
Application July 23, 1953, Serial No. 369,836
Claims priority, application Germany July 29, 1952
3 Claims. (Cl. 151—6)

1. In combination with a bolt having longitudinal recesses, a nut threaded thereon and having radial grooves in the upper and lower end portions thereof, and a safety device for said bolt and nut comprising a substantially U-shaped central spring portion, the ends of said portions having upper and lower inwardly directed projections, said upper projections being located in upper grooves of the nut and extending into the recess of the bolt, and the lower projections extending at least into lower grooves of the nut, whereby said nut will be locked against rotation on said bolt and said safety device will be retained in position.

2,773,534
**PNEUMATIC VEHICLE WHEEL TIRE CASINGS**
Giuseppe Lugli and Carlo Mazza, Milan, Italy, assignors to Pirelli Societa per Azioni, Milan, Italy, a limited liability company of Italy
Application October 21, 1952, Serial No. 316,356
Claims priority, application Italy May 3, 1952
3 Claims. (Cl. 152—356)

1. A pneumatic rubber tire casing comprising a carcass interiorly reinforced with an all-metal reinforcement consisting of at least two layers of metal wire formations embedded in the rubber of the casing, said metal wire formations being disposed in juxtaposition and also parallel relation to one another in the respective layers and in the case of each layer being disposed in planes which are substantially radial to the tire; a tread mounted on the carcass in integral connection therewith; and a substantially cylindrical breaker structure interposed between the tread and the carcass, said breaker structure consisting of at least two layers of metal wire formations also embedded in the rubber of the casing and also disposed in juxtaposition and parallel relation to one another in the respective layers, said metal wire formations of the layers forming the breaker structure being disposed in the case of each layer in planes which are substantially parallel to the equatorial plane of the tire, the breaker structure having a width dimension cross-sectionally of the casing which is not greater than that of the tread, the over-all width dimension of the casing cross-sectionally thereof being greater than the over-all height dimension, and the metal wire formations of all of the layers thereof, both of the carcass reinforcement and also of the breaker structure, being composed solely of a plurality of elementary wires wound about one another to the form of a unitary structure and having a diameter not less than 0.2 mm.

2,773,535
**REINFORCEMENT FOR MOLDED FLAPS**
Eric O. Teleman, Grosse Pointe Woods, Mich., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application August 24, 1953, Serial No. 375,950
1 Claim. (Cl. 152—365)

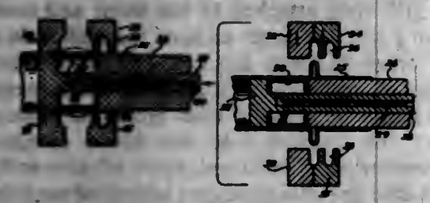


A continuous tire flap having a valve stem opening therethrough, a single metal reinforcing plate embedded in said flap, said plate having a central portion provided with an opening aligned with the valve stem opening, two opposed sides of said central portion being bent at substantially right angles to the central portion to form short reinforcing flanges which render said central portion rigid, and unreinforced comparatively flexible wing portions which extend transversely of the flap from each of two other opposed sides of said central portion.

2,773,536
**CAN CRUSHING DEVICE**
Erich A. Lange, Lakewood, Ohio
Application July 6, 1953, Serial No. 366,129
2 Claims. (Cl. 153—10.5)

1. In a can crushing device a box-like housing with parallel front and rear walls, pairs of aligned grill rods in said housing subdividing same into superposed compartments, each of said pairs of grill rods having the outer ends of its grill rods attached to the front and rear walls of the housing and the inner ends of the grill rods spaced from each other to form the grill-like means provided by said pairs of grill rods with an open break permitting gravity discharge of crushed cans from the upper compartment of the housing into the lower compartment thereof, symmetrically arranged pairs of left and right-handed threaded spindles arranged in spaced parallel relation within said housing and journaled in the front and rear walls thereof, chain drive means for said spindles arranged within said housing near its front wall adapted to effect simultaneous rotation of the spindles, and can crushing plate means threadedly mounted on opposite end portions of the spindles to be shifted in parallel relation and in opposite directions with respect to each other when the spindles are rotated by the drive means, said open break in said grill-like means located midway between the plate means to effect in can crushing operations alignment of crushed cans with the open break in the grill-like means.

2,773,537
**METAL-BENDING MACHINES**
Albert Maurice Redman, Worcester, England, assignor to Redman Tools & Products Limited, Worcester, England, a British company
Application March 30, 1953, Serial No. 345,437
7 Claims. (Cl. 153—46)



1. A metal-bending machine comprising a frame, a curved former of said frame, means to hold a workpiece in place against the former for shaping, a shoe capable of rolling upon the workpiece against the former, pressure-applying means to press the shoe, workpiece and

former together, means to effect rolling of the shoe against the former, while the pressure is maintained, to shift the place of application of pressure to the workpiece progressively along its surface, the means to hold the workpiece in place serving to clamp against the former one end of the part to be bent and the shoe moving during the bending operation in a direction to shift the place of application of pressure to the workpiece away from the clamped end, a supplementary work-holding member, situated on the side of the nip between shoe and former towards which bending proceeds, to support the workpiece against becoming mis-aligned with respect to the former while being bent, said supplementary work-holding member being mounted on the shoe to slide along it, and actuating means operatively connected to the supplementary work-holding member to move it while the workpiece is being bent along the shoe and workpiece ahead of the place of application of pressure to the workpiece as said place is shifted, thereby keeping said member clear of the nip between shoe and former.

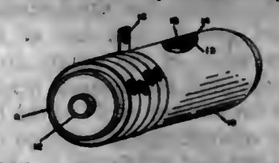
---

2,773,538
**CONVOLUTION FORMING MACHINE**
Francis F. De Mars, Escondido, Calif., assignor to Solar Aircraft Company, San Diego, Calif., a corporation of California
Application November 10, 1950, Serial No. 195,033
13 Claims. (Cl. 153—73)

1. A machine for forming wall convolutions in a tubular workpiece comprising in combination; a plurality of female die means adapted to be positioned externally of said workpiece, hollow flexible forming means adapted to be positioned internally of said workpiece, means for applying fluid pressure to the interior of said forming means to displace said forming means radially outward thereby forcing said workpiece into said female die means to form a convolution, means for relieving said fluid pressure to withdraw said forming means from said convolution, means for moving each of said die means carrying said workpiece with respect to said forming means while holding the latter stationary to position an unformed portion of said workpiece around said forming means, means for returning said die means to a position opposite said forming means independently of said workpiece, and means for controlling said pressure applying and relieving means in timed relation with the die moving and returning means whereby said pressure is relieved during the operation of said die moving and returning means.

---

2,773,539
**TUBE FLARING TOOL**
George E. Franck, Riverside, Ill., assignor to The Imperial Brass Manufacturing Company, a corporation of Illinois
Application September 26, 1951, Serial No. 248,428
2 Claims. (Cl. 153—81)



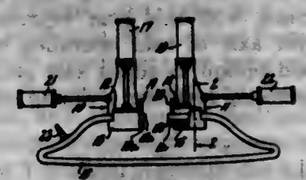
1. A tube flaring tool comprising: a fitting member having an opening; a hollow shaft member extending rotatably through the opening; a rod member extending rotatably through the shaft member and having a flaring element at one end; interengaging threads on two of said members arranged, when relative rotation is effected therebetween, to effect axial movement of the rod member relative to the fitting member; operating means including a handle portion axially movable, non-rotatively secured to the other end of the rod for rotating the same, and separable, co-acting elements associated with the handle portion and the shaft member and so arranged that the shaft member rotates when the handle portion is rotated while in one axial position on the rod and remains fixed when the handle portion is rotated while in another axial position on the rod, thereby effecting alternatively combined rotative and axial movement of the rod and unlimited rotative movement of the rod without conjoint axial movement thereof, said elements having a lost motion connection permitting limited rotation of the

rod without relative rotation of the members having said interengaging threads when said handle portion is axially positioned to permit co-action between said elements; means for limiting axial movement of the handle portion relative to the rod including an element on said rod having a portion projecting laterally from the rod and arranged to abut a stop shoulder on the handle portion when the handle portion is axially positioned to separate said elements; and means for yieldingly retaining the handle portion in a desired axial position on the rod including spring detent means on said rod and cooperating means connected to the handle portion.

---

2,773,540
**METHOD FOR MANUFACTURING ENDLESS V-TYPE BELTS**
Dale L. Waugh, Dayton, Ohio, assignor to The Dayton Rubber Company, a corporation of Ohio
Application December 23, 1952, Serial No. 327,572
10 Claims. (Cl. 154—4)

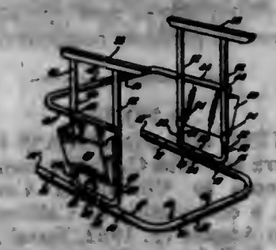
1. A method for manufacturing endless rubber V-type belts comprising tension, neutral axis and compression sections which comprises winding about a suitable mandrel a tension layer comprising at least one layer of rubberized fabric, applying thereto a neutral axis layer comprising at least one layer of helically wound strength cord, winding thereon a compression layer comprising rubber, vulcanizing the cylindrical belt sleeve thus formed, cutting circumferentially of the vulcanized sleeve to form individual V-type annular belts in inverted position and turning these belts inside out.



---

2,773,541
**METHOD OF SPLICING RUBBER ARTICLES**
Francis A. Mulberger and Alfred B. Clayton, Indianapolis, Ind., assignors to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application May 26, 1954, Serial No. 431,092
10 Claims. (Cl. 154—14)

1. The method of splicing rubber articles comprising, separately gripping end portions of the articles with extreme end portions thereof extending from the faces of the gripping means, severing the extending portions substantially flush with the faces of the gripping means, moving said faces of said gripping means into abutting



engagement with the severed ends of the articles in alignment to thereby completely confine said ends, thereafter while the faces of said gripping means are in engagement increasing the gripping pressure on the ends of said

articles to cause said aligned severed ends to be forced into tight abutting relationship to form a splice by extrusion pressure created therein by the increase in said gripping pressure, and thereafter releasing the gripping means.

---

2,773,542
**SUPPORT DEVICE FOR PHYSICALLY HANDICAPPED**
Joseph Chasin, New York, N. Y.
Application March 18, 1953, Serial No. 343,071
7 Claims. (Cl. 155—1)

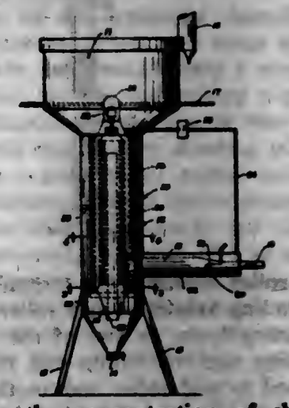
1. A support device for the physically handicapped consisting of an open-ended and continuous U-shaped base member having a front cross leg and rearwardly directed side legs, non-skid elements affixed to and extending along the undersurfaces of said side legs, the bottom surface of said non-skid elements lying along a common, substantially horizontal plane, a pair of laterally spaced upright legs mounted on the rear portions of said side legs, a horizontal cross member secured to and extending between said upright legs at points between the ends thereof and being vertically adjustable relative to said base member, and forwardly directed arm rest members mounted on said upright legs above said cross member.

---

2,773,543
**COUPLING CONNECTION FOR WIRE SPRING STRUCTURES**
William C. Sandor, Solon, Ohio, assignor to The Universal Wire Spring Company, Bedford, Ohio, a corporation of Ohio
Application February 15, 1954, Serial No. 410,102
7 Claims. (Cl. 155—179)

1. In a wire spring structure two elongated wire members removably, non-rotatably coupled with each other, a sharply curved open loop in one of said wire members, and an S-shaped loop in the other one of said wire members, said S-shaped loop including three substantially parallelly arranged cross-bars the other ones of which are spaced from each other a distance less than the outside diameter of the sharply curved open loop in said one wire member, said S-shaped loop having the cross-bar between said two outer cross-bars extended through said sharply curved open loop in said one wire member and yieldingly hugging with said two outer cross-bars the outside wall of said open loop.

---



2,773,544
**FLEXIBLE CHAIRS**
George A. Dunenbury, Salada, N. C.
Application May 13, 1953, Serial No. 354,844
3 Claims. (Cl. 155—187)

1. In a flexible chair a support frame, said frame comprising a first resilient U-shaped member having a ground engaging web and upstanding portions forming front legs, a second resilient U-shaped member having a ground engaging web and upstanding portions forming rear legs, and means connecting the webs of said first and second U-shaped members; two substantially L-shaped members each being separate from one another, means pivotally connecting each said member to an upper portion of a front leg and an upper portion of the corresponding rear leg; and flexible material slung between said L-shaped rods, said L-shaped members being coupled to each other only through said support frame and said flexible material.

---

2,773,545
**SUBMERGED COMBUSTION EVAPORATION**
Lowell W. Peterson, Homewood, Ill., assignor to Swift & Company, Chicago, Ill., a corporation of Illinois
Application October 24, 1952, Serial No. 316,640
5 Claims. (Cl. 159—16)

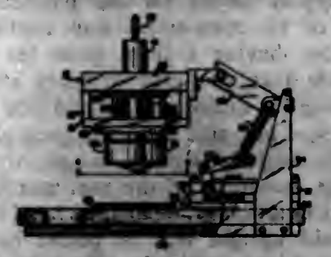
1. Apparatus for the concentration of charrable organic liquids, adapted to be disposed within the liquid-containing portion of an evaporator body, comprising: a completely closed shell having a plurality of open tubes extending therethrough about the periphery thereof means associated with said shell for introducing a heat exchange medium thereinto; a second completely closed shell disposed concentrically within said first mentioned shell; a plurality of open tubes extending through and disposed about the periphery of said second shell, said tubes of said second shell communicating at each end thereof with the interior of said first mentioned shell; means for introducing hot combustion gases within said second mentioned shell; and conduit means located concentrically within said second mentioned shell, said conduit means being open at both ends thereof, one of said ends extending through said first and second mentioned shells and the other of said ends communicating with the interior of said second mentioned shell.

2,773,546
**CURTAIN FIXTURES**
Alma Ethel Doty, San Jose, Calif.
Application October 18, 1952, Serial No. 315,599
1 Claim. (Cl. 160—349)

A curtain tie-back and offsetting device comprising a single generally flat plate having forwardly flaring straight upper and lower side edges each inwardly curled over the front surface of the plate throughout the full length of the edge between a relatively short rear end and a relatively long front end and a hook integral with the plate and accessible from the front surface of the plate and located midway between said side edges adjacent said relatively short rear end, the back surface of the plate adjacent the rear end being adapted to be fixedly engaged with the side surface of a window frame member so that the forward portion of the plate will project beyond the front surface of the frame member, whereby the terminal ring of a tie-back may be engaged with said hook with the adjacent portion of the tie-back retained beneath the curled edges of the plate and the remote portions of the tie-back being looped around a curtain and held spaced outwardly from the window frame member by the relatively long front end of the plate.

2,773,547
**ROLLER MOUNTING FOR TARPAULINS**
Hans Conrad Voss, Los Angeles, Calif.
Application September 11, 1953, Serial No. 379,520
3 Claims. (Cl. 160—301)

1. In a roller mounting for tarpaulins, a tubular roller, a rod extending axially of said roller having an end portion projecting from an end of the roller, a coil spring encompassing said rod within said roller having one end thereof fixed to said roller and another end fixed to said rod, said spring being adapted to be tensioned to effect rotation of the roller relative to the rod and means for temporarily interconnecting the rod and roller to hold the latter against rotation under the urge of said spring embodying an arm affixed to the projecting end portion of said rod, and a screw carried by said arm detachably engageable with said roller.

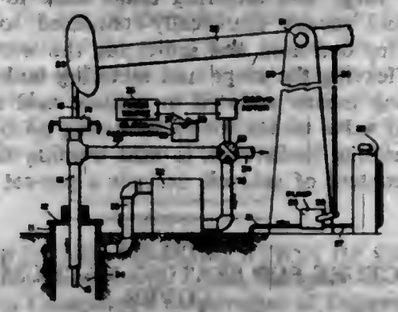


2,773,548
**TIMING DEVICE OF THE RESETTABLE AND VARIABLE TYPE**
Norman F. Thompson 3rd, Colebrook, and George Marree, Winsted, Conn., assignors to The William L. Gilbert Clock Corporation, Winsted, Conn., a corporation of Connecticut
Application April 22, 1954, Serial No. 424,964
7 Claims. (Cl. 161—1)

1. A variable timer, comprising a pivoted operating member for controlling the operation of a device being timed by the timer, said operating member being turnable into and from a terminal position to terminate and start, respectively, operating cycles of selectively timed duration; a gear segment pivoted on said operating member at a point remote from the pivot axis of the latter; a pinion in mesh with said gear segment and turnable about the pivot axis of said operating member; means for turning said pinion to adjust said gear segment relative to said operating member; a timing element normally

urged in one direction into a starting position, and movable in the opposite direction, from its starting position through a distance varying with the adjustment of said gear segment, to coact with the latter and turn said operating member into its terminal position; a power drive for moving said timing element in said opposite direction at a predetermined rate; a clutch incorporated in said power drive; and means disengaging and reengaging said clutch in response to movement of said operating member into and from its terminal position, respectively.

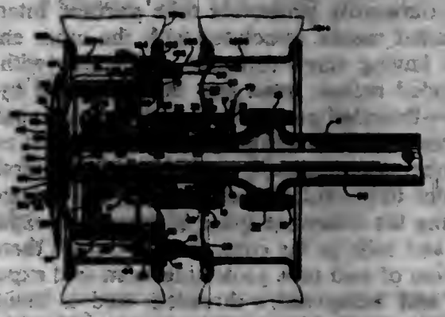
2,773,549
**CUTTING DIE FOR GLASS FIBERS**
Philip H. Legarra and Mac C. Cutler, Santa Clara County, Calif., assignors to Vibrasonic Corporation, Santa Clara, Calif., a corporation of California
Application August 13, 1952, Serial No. 304,115
6 Claims. (Cl. 164—13)



1. A die for cutting a hollow tubular shaped article from a compressible fibrous body without subjecting the article cut therefrom to a compression load above a predetermined maximum, said die comprising a die holder, a generally tubular cutting member on said holder, said member having a first generally tubular cutting member conforming to the outer peripheral configuration of the article to be cut and a second generally tubular cutting member conforming to the inner peripheral configuration of the article to be cut, the second cutting member being positioned within the first cutting member and spaced therefrom to provide a chamber therebetween to receive uncompressed said shaped article cut from the fibrous body, said second cutting member defining in the interior thereof a second chamber for receiving waste fibrous body, a pressure member arranged in said second chamber yieldably urged downwardly for compressing the waste fibrous body during cutting of said shaped article, a pilot pin carried by said pressure member, and means for yieldably urging said pin to cause the same to protrude below the bottom of said pressure member, and to protrude below the cutting edges of the cutting members for engaging and penetrating the waste fibrous body prior to the contact of the cutting members with the work to prevent lateral shifting of the working during the cutting thereof, each of said cutting members having a cutting edge on the end periphery thereof with the angle face of the edge facing outwardly relative to the cut surface of the article cut thereby.

2,773,550
**WELL CASING PROTECTOR METHOD**
Dayne L. Wilson, Pasadena, Calif., assignor to Oil Base, Inc., Compton, Calif., a corporation of California
No Drawing. Application February 9, 1953, Serial No. 336,807
1 Claim. (Cl. 166—1)

A process for protecting well casings from sub-surface shock and corrosion, comprising the steps of forming an annulus between the well casing and the surrounding earthen formation, and applying to said annulus, to fill the same, a thixotropic composition prepared by dispersing in a base oil about 3 to about 6 pounds per barrel of a fatty acid having 12 to 18 carbon atoms per molecule, from about 1 to 2 pounds per barrel of an alkali metal hydroxide, a weight material, and water, said composition having a grease-cone penetration after standing for 24 hours at 120±1° F. in the range of from 150 to 400 millimeters/10.



2,773,551
**AUTOMATIC INHIBITOR INJECTION SYSTEM FOR PUMPING WELLS**
Robert Lankford Warden and Kenneth Wayne Robertson, Odessa, Tex., assignors to Shell Development Company, New York, N. Y., a corporation of Delaware
Application August 23, 1954, Serial No. 451,646
4 Claims. (Cl. 166—75)

1. A well system having a well casing, a production flowline, and an apparatus for automatically and periodically injecting relatively large batches of a chemical reagent into the well casing, said apparatus comprising a chemical metering pump, a chemical storage tank connected to the input of said metering pump, a flushing chamber connected to the output of said metering pump, prime mover means for actuating said chemical metering pump, to force increments of a chemical reagent from said storage tank to said flushing chamber, first conduit means in communication between said flushing chamber and said well casing, a power-operated three-way valve in said well flowline, by-pass conduit means in communication between said three-way valve and said flushing chamber, and circuit means for periodically actuating said three-way valve to direct the flow of fluid from said well flowline through said by-pass conduit means and into said flushing chamber to be discharged therefrom into the well casing together with the chemical reagent supplied to the flushing chamber by the metering pump.

2,773,552
**DRIVE WHEEL AND BRAKE ASSEMBLY**
Hans O. Schjolin, Birmingham, and Donald K. Ickell, Pontiac, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application June 19, 1953, Serial No. 362,874
9 Claims. (Cl. 188—75)

1. In a wheel structure for an automotive vehicle, the combination of; an axle housing; a wheel comprising a hub journaled on said housing, a segmented rim portion, and a supporting spoke structure connecting said hub and the segments of said rim portion; a brake assembly splined on said housing between said hub and the outer end of said housing; a brake drum encircling said brake assembly and having a wall closing the outer side thereof; the inner side of said drum being open and having flange segments projecting radially of the drum at the peripheral edge of the open side thereof and a continuously extending peripheral surface forming therewith angular seat

means; each of said rim portion segments having cooperating angular seat means thereon engaged by the aforesaid angular seat means to thereby coaxially align said drum with the wheel axis; and an axle extending through said housing and drivingly engaging said drum wall to drive said wheel therethrough.

2,773,553
**MUFFLER**
Josef Heurich and Alexander Leopold Gerve, Augsburg, Germany, assignors to Maschinenfabrik Augsburg-Nurnberg A. G., Augsburg, Germany, a corporation of Germany
Application February 13, 1953, Serial No. 336,792
26 Claims. (Cl. 181—42)

1. A muffler device of the character described for application to a machine to reduce the noise of a gas current developed therein, said noise having a component of a predetermined wave length, comprising a plurality of silencing channels disposed in the line of flow of said gas current through said machine for dividing said noise producing current into a plurality of partial currents, a common duct communicating with all said silencing channels and with said machine, and means for attaching said duct to a noise producing element of said machine for directing said gas current through said common duct and said partial currents through said silencing channels, the internal width of each of said silencing channels being approximately ¼ to ½ said predetermined noise component wave length.

2,773,554
**FLOOR DRAIN SEAL**
Eugene A. Lindorf, South Bend, Ind.
Application September 6, 1952, Serial No. 308,226
1 Claim. (Cl. 182—24)

A seal adapted to be mounted in a floor drain having a restricted outlet portion, comprising an open ended tube having an outwardly projecting abutment portion, an ex-

pansible member having a passage therethrough receiving said tube with clearance, said member having a normal transverse outer dimension less than said restricted outlet, end plates engaging the opposite ends of said expansible member and apertured to fit around said tube, one plate having continuous circumferential engagement with said outwardly projecting tube portion, internally screw-threaded means associated with the other end plate, said tube having screw-threaded connection with said screw-threaded means, hand grip means carried by one of said screw-threaded parts to accommodate manual relative adjustment of said means, plates and tube to compress said member longitudinally and expand it laterally to a size greater than said restricted outlet, said means and plates sealing the clearance space between said expansible member and tube in the compressed position thereof, one end portion of said tube projecting from said expansible member and being screw-threaded, and a threaded closure member carried by said last named threaded tube portion, said tube has an enlarged projecting end portion defining a shoulder bearing against said first named plate, said tube having an external thread at its small end and an internal thread in its enlarged end, said screw-threaded means being fixedly carried by the other end plate and said hand grip projecting from said enlarged tube portion.

---

2,773,555

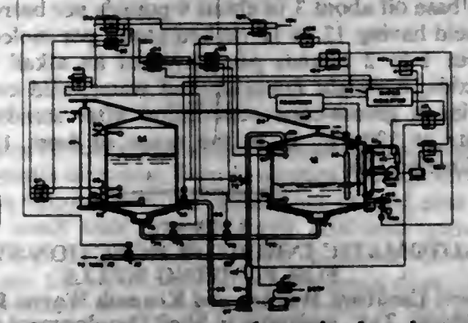
## DEAERATORS

Harry E. Pape, Norwood, Pa., assignor to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware

Application December 21, 1954, Serial No. 476,886
12 Claims. (Cl. 183—2.5)

1. A deaerator for liquids which comprises a vacuum chamber, a liquid conduit extending upwardly into said vacuum chamber, a liquid interrupting screen carried adjacent the top of said conduit, a conical disc carried by said conduit below said screen and in spaced relation thereto, said conical disc being in position to receive substantially all the liquid passing through said screen, and a discharge conduit extending from the bottom of the chamber.

---



2,773,556

## APPARATUS FOR AUTOMATICALLY TREATING AND METERING OIL FIELD PRODUCTION

Douglas C. Meyers, Midland, and William B. Banks, Odessa, Tex., and Lucian E. Slagle, New Orleans, La., assignors to Shell Development Company, New York, N. Y., a corporation of Delaware

Application January 18, 1955, Serial No. 482,642
4 Claims. (Cl. 183—2.7)

1. A system for automatically treating and metering oil well production fluid prior to its delivery to a pipe line comprising a gas-oil separator adapted to receive well fluid from a plurality of wells and to separate the gas component therefrom, a treating tank, a surge tank, a metering tank, conduit means in communication between said separator and said treating tank, between said treating tank and said surge tank and between said surge tank and said metering tank, fluid transfer pump means in said conduit means between said surge and said metering tanks, said surge and said metering tanks being provided with drain ports for periodically removing the substantially stagnant fluid from the bottoms thereof, return conduit means in communication from said drain ports of said tanks through said transfer pump means to said treating tank for recirculating the stagnant fluids for treatment in said treating tank, discharge fluid port means in said metering tank provided with power-actuated valve means in communication with said pipe line, power-actuated valve means in each of said conduit means leading to and from said fluid transfer pump, electrical circuit means for actuating said valve means on a predetermined cycle to automatically fill and empty said metering tank and to recirculate the substantially stagnant liquid from the bottoms of said surge and metering tanks back to said treating tank, and means electrically-connected to said circuit means for detecting and indicating the water content of the oil leaving the surge and metering tanks, said water-indicating means adapted to actuate said circuit means and said valve means for recirculating oil from the surge and metering tanks back to said treating tank when the water content of said oil exceeds a pre-set value.

---

2,773,557

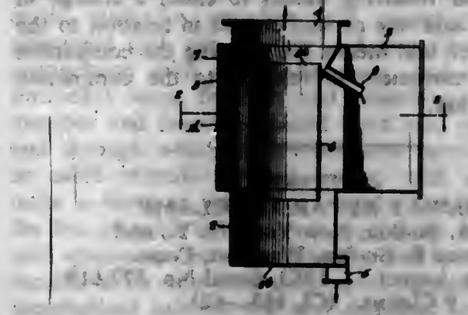
## STRUCTURE FOR SEATING VACUUM CLEANER COVER

Axel Olof Engberg, Stockholm, Sweden, assignor to Aktiebolaget Elektrolux, Stockholm, Sweden, a corporation of Sweden

Application December 10, 1953, Serial No. 397,385
Claims priority, application Sweden December 20, 1952
8 Claims. (Cl. 183—51)

1. In a vacuum cleaner, a casing having an opening into the interior thereof and a cover for the opening, a dust collecting member through which air is adapted to pass, said dust collecting member normally being positioned in the interior of said casing within said cover, positioning means providing a seat for retaining said dust collecting member in its normal position, said cover being movable into the interior of said casing past said positioning means when said dust collecting member is withdrawn from said casing, and means including said dust collecting member, when the latter is seated on said positioning means, to provide a seat for holding said cover in position at the opening of said casing.

---



2,773,558

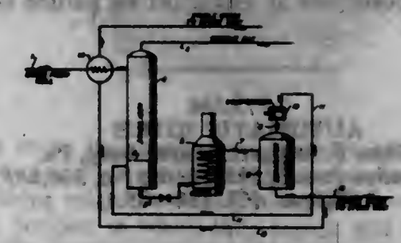
## SEPARATOR FOR LIQUID DROPS OR FOAM

Ake Arborgh, Jonkoping, Sweden, assignor to Aktiebolaget Svenska Flaktfabriken, Stockholm, Sweden

Application June 22, 1954, Serial No. 438,552
Claims priority, application Sweden June 30, 1953
1 Claim. (Cl. 183—83)

A device for separating liquid drops and foam from a gaseous medium comprising a cyclonic separator including a spiral casing having a tangential inlet thereto, a cylindrical bottom casing underlying the spiral casing coaxially thereof and having an outlet for separated liquid drops and foam, means defining an outlet for the gaseous medium at the top of the spiral casing disposed coaxially of said spiral casing and the bottom casing, a central tube disposed interiorly of the separator and extending coaxially therein from the upper portion of the bottom casing through the spiral casing and terminating in spaced relation below the outlet at the top of the latter, an upwardly divergent wall circumscribing the upper portion of the central tube and extending from the latter to said outlet at the top of the spiral casing with the upper end of said central tube projecting within the divergent wall and forming therewith an annular groove for receiving liquid drops and foam separated from the gaseous medium, and an outlet pipe connected to the groove for discharging the liquid drops and foam collected in said groove.

---



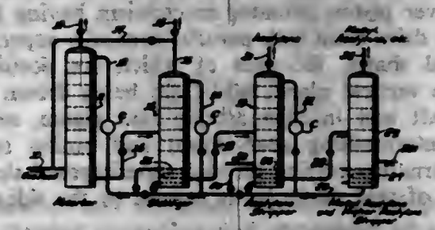
2,773,559

## HIGH PRESSURE STABILIZATION OF OILS

John E. Cottle, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Application December 4, 1953, Serial No. 396,235
12 Claims. (Cl. 183—114.5)

1. The degasification of a liquid which comprises passing said liquid containing gases into a degasifying zone under an elevated pressure and therein heating said liquid to a moderately elevated temperature such that said liquid is not chemically altered, removing some gases from said liquid in said zone, removing liquid still containing a substantial portion of gases from said zone and in a separate heating zone heating said liquid while maintaining intimately together all of said gases and all of said liquid at a pressure lower than that prevailing in said degasifying zone to a higher temperature than in said degasifying zone but still below a temperature at which said liquid is chemically altered, then in a still further and separate zone separating gases from said liquid at a substantially reduced pressure so as to obtain a degassed liquid and gases still at an elevated temperature, increasing the pressure of said gases and returning said gases to said zone, the said gases which are intimately maintained together with said liquid permitting heating said liquid without undesirable decomposition to temperatures substantially exceeding those to which said liquid can be heated in the absence of said gases.



---

2,773,560

## SEPARATION OF ACETYLENE COMPOUNDS

Arthur L. Kohl, Burbank, and Fred C. Riesenfeld, Hollywood, Calif., assignors to The Fluor Corporation, Ltd., Los Angeles, Calif., a corporation of California

Application May 18, 1953, Serial No. 355,639
9 Claims. (Cl. 183—115)

1. The process of separately recovering acetylene-containing and methyl acetylene-containing gases from a gaseous mixture thereof containing other gaseous constituents, that comprises contacting said mixture in an absorption zone with an alkyl ether of diethylene glycol absorbent in which the alkyl radical is of the class consisting of alkyl groups within the 1 to 4 carbon atom range and absorbing acetylene and methyl acetylene therein, said absorbent having a boiling temperature in excess of 175° C., passing the absorbent into a first stripping zone and therein separating the bulk of the acetylene from the absorbent, and passing the residual absorbent into a second zone and therein separating the bulk of the methyl acetylene from the absorbent.

---

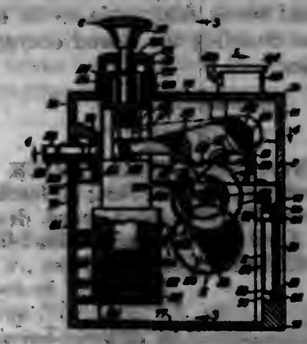
2,773,561

## SILVER-PALLADIUM FILM FOR SEPARATION AND PURIFICATION OF HYDROGEN

James B. Hunter, Havertown, Pa., assignor to The Atlantic Refining Company, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application May 2, 1955,
Serial No. 505,563
4 Claims. (Cl. 183—115)

1. A process for the recovery of free hydrogen from a gaseous mixture comprising hydrogen and other gases comprising the steps of bringing said gaseous mixture into contact with one side of a thin non-porous film consisting essentially of a silver-palladium composition containing from 10% to 50% silver, causing the hydrogen of said gaseous mixture to permeate through said film and removing the permeated hydrogen from the opposite side of said film.



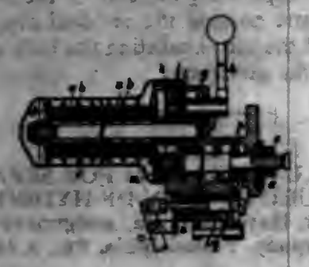
---

2,773,562

## LUBRICATING PUMP

Thomas R. Thomas, New York, N. Y., assignor to Auto Research Corporation, a corporation of Delaware

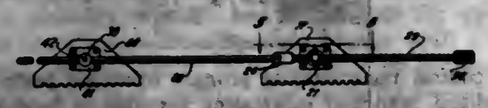
Application May 5, 1951, Serial No. 224,989
5 Claims. (Cl. 184—37)



1. A central reciprocating plunger lubricant pump for a centralized branched lubricating installation having an upright cup-shaped lubricant reservoir casing devoid of mechanism, an inverted cup-shaped cover for said casing, a drive shaft for said pump mounted in the sides of said

cover cup and extending horizontally through and below the top of said cover and a cylinder extending through and depending downwardly from said cover and at its lower end being at the bottom of the lubricant reservoir casing so that it will be immersed in the lubricant body, a spring returned reciprocating piston in the lower end of said cylinder, said pump being characterized by a cam-lever piston actuator mechanism having a reduction gear drive train with parallel vertically superimposed horizontal shafts, the axes of which are positioned in the same vertical plane, said train being driven by said drive shaft and in turn driving said piston, said train having intermeshing gear wheel and pinion reduction units alternately carried on said superimposed shafts and the ends of said shafts being carried by the sides of said cup.

---



2,773,563
**ENGINE STARTING APPARATUS**
William Albert Bovis, Pinner, Leslie Gordon Chapman, Ealing, London, and Wilfrid Edward Walter Nicolls, Pinner, England, assignors to C. A. V. Limited, London, England
Application October 25, 1954, Serial No. 464,548
Claims priority, application Great Britain October 27, 1953
3 Claims. (Cl. 185—39)

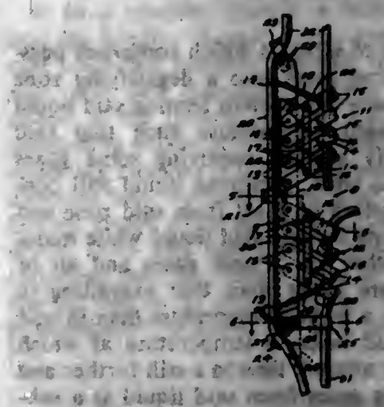
1. An engine starting apparatus comprising in combination a cylindrical elastic member, manually operable means connected to one end of said elastic member for torsionally straining the latter to cause energy to be stored therein, transmission means connected to the other end of said elastic member for imparting the energy stored therein to the engine, and a catch engageable with said transmission means for controlling the action thereof, said transmission means including an internally screw threaded axially and rotationally movable pinion for engagement with the engine, and a complementary screw threaded member on which said pinion is mounted, and which is rotatable by said manually operable means through the medium of said elastic member, when said catch is in an initial inoperative position, to cause axial movement of said pinion into its engine-engaging position, said catch being subsequently movable into an operative position for holding said complementary screw threaded member stationary whilst energy is being stored in said elastic member, and being returnable to its initial inoperative position for enabling the stored energy to be imparted to the engine.

---

2,773,564
**ADJUSTABLE WHEEL CHOCK**
Frank L. M. Garard, Sr., Dallas, Tex.; Helen Ida Garard, executrix of said Frank L. M. Garard, deceased
Application April 2, 1953, Serial No. 346,479
5 Claims. (Cl. 188—32)

1. A vehicle stabilizing means comprising a pair of chocks, a connecting means for holding said chocks in spaced apart relationship, said connecting means comprising a bar in relatively pivoted and longitudinally alignable sections, one of which sections is threaded longitudinally, rotatable means carried by each of said chocks for slidably receiving the sections of said bar, means included in the pivotal connection of the threaded section to the adjacent section permitting rotation of the threaded section of said bar, means carried by the rotatable bar receiving means of one of said chocks and engaging the threaded section of said bar to hold the latter against other than rotative longitudinal movement through said bar receiving means to effect a change in the position of said one of said chocks in relation to the companion chock and means for securing the companion chock against movement in relation to the companion section of said bar.

---

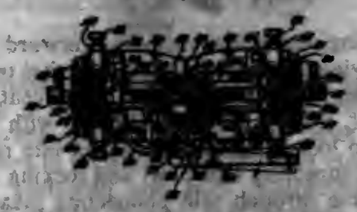


2,773,565
**RAILWAY RETARDER CLAMP**
John A. Bodkin, New York, N. Y., and Richard E. Bodkin, Westport, Conn.
Application August 31, 1953, Serial No. 377,619
9 Claims. (Cl. 188—62)

1. A clamp for connecting a track rail and a retarder rail extending along and aside of said track rail at a variable distance therefrom, said clamp comprising a rigid U-shaped member having a yoke end and having two elongated legs extending, one over the other, horizontally from said yoke end, said legs having ends far from said yoke end, the upper leg having a shoulder positioned near said yoke end and forming a surface facing toward said far end of this leg, said upper leg having a portion extending from said shoulder to said far end, said clamp further comprising a bracket secured to and connecting said far leg ends and having a surface facing said shoulder surface, and a spring positioned on said upper leg portion between said surfaces.

---

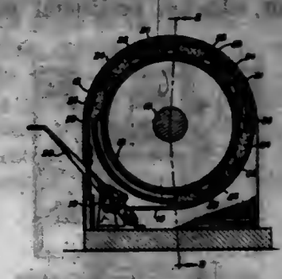
2,773,566
**AUTOMATIC HITCH**
William F. Steggem, Waynesburg, Pa.
Application June 8, 1953, Serial No. 360,247
2 Claims. (Cl. 188—65.1)



1. A device of the character described comprising a single length of cable or line and an automatic hitch, said hitch comprising an elongated base member, a pair of anchoring units pivotally connected to said base member in longitudinally spaced apart relationship to one another for swinging movement longitudinally of the base member toward and away from one another, each of said anchoring units including a plurality of rigid strap members each pivoted to the base member and each having a line or cable clamping eye at the end thereof disposed remote from said base member, said clamping eyes of each anchoring unit being disposed in alignment when the strap members thereof are disposed perpendicular to the longitudinal axis of the base member for receiving the ends of the line or cable, said clamping eyes of the two anchoring units being swingable away from one another by frictional engagement with the cable ends when said cable ends are pulled away from one another and away from the ends of the automatic hitch for swinging said clamping eyes out of alignment with one another and into frictional gripping engagement with said cable ends, and a plurality of stationary loops fixed to and projecting from the base member and laterally spaced from said anchoring units and through which an intermediate portion of the line or cable extends for cooperation with said anchoring units to form an adjustable loop in each end portion of the line or cable beyond each end of the automatic hitch, said stationary loops including a pair of end loops extending from said base member at oblique angles to the longitudinal axis thereof and disposed beyond the ends of the base member for frictionally gripping the line or cable to prevent said intermediate portion thereof from sliding relatively to the automatic hitch while the looped end portions are under tension and to permit the line or cable to be readily adjusted relative to the stationary loops when the looped end portions of the line or cable are not under tension.

---

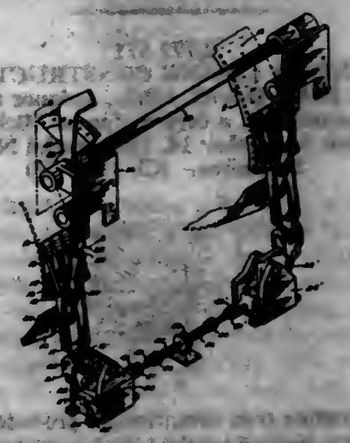
2,773,567
**DISC BRAKE ACTUATING MECHANISM**
Gerald E. Fairchild, Altadena, Calif., assignor to Aircraft Brake Company, Carson City, Nev., a corporation of Nevada
Application June 8, 1953, Serial No. 360,266
5 Claims. (Cl. 188—72)



1. A brake comprising two elements and a relatively rotatable member received axially therebetween, said elements being relatively axially movable toward and away from a position in which they engage said member and frictionally retain it against said relative rotation, a first pair of levers positioned at a first axial side of said elements and acting to displace one of said elements toward the other, an actuating unit operable to actuate both of said levers, a second pair of levers at a second side of said elements and operable to displace said elements relatively together, two axially extending links interconnecting said first and second levers, and emergency brake operating means operable to actuate said second pair of levers, said emergency brake operating means comprising an additional lever unit acting against a pair of proximately positioned ends of the levers of said second pair.

---

2,773,568
**NON-SELF-ENERGIZING BAND TYPE BRAKE**
Douglas Reglend, Houston, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware
Application February 19, 1954, Serial No. 411,409
5 Claims. (Cl. 188—77)

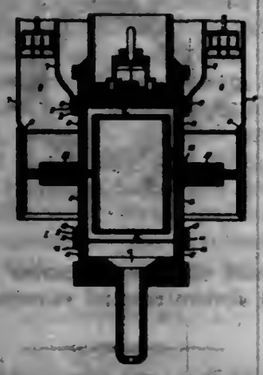


1. In combination with a band type brake mechanism including a brake rim and a brake band, a stationary member having a plurality of openings therein mounted so as to dispose said plurality of openings outside the periphery of said brake rim and inside the periphery of said brake band, and friction material loosely confined

within each of said stationary member openings to provide for limited circumferential movement of said friction material.

---

2,773,569
**MECHANICAL BRAKING SYSTEM**
Ernest D. Garrett, Shreveport, La., assignor of one-half to David G. Crow, Shreveport, La.
Application August 11, 1950, Serial No. 178,904
7 Claims. (Cl. 188—77)



1. Apparatus of the class described comprising, a plurality of brake drums, brake bands extending respectively around said brake drums, lugs fixed respectively to the ends of said brake bands, yokes connected respectively to a lug on one end of each of said brake bands, a plurality of stationary base members, pivot plates pivotally mounted respectively in each of said base members and connected to said yokes, a stabilizing bar connected between said pivot plates, a stationary stop member provided with a bore slideably receiving said bar, sleeves adjustably fixed to said bar on opposite sides of said stop member, compression springs held respectively between each of said sleeves and said stop member, a rotatably mounted brake actuating rod, tension transmitting means extending substantially tangential to said brake bands respectively through said yokes and connecting the lugs on the other end of said brake bands to said brake actuating rod, and means for rotating said brake actuating rod.

---

2,773,570
**COMBINED VACUUM SEAL AND ELECTRODE TERMINAL**
Theodore G. Milton and Theodore C. Swartz, Schenectady, N. Y., assignors to General Electric Company, a corporation of New York
Application November 29, 1952, Serial No. 323,306
2 Claims. (Cl. 189—36.5)

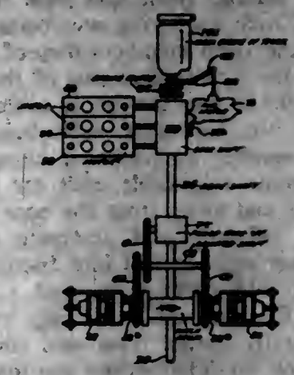
1. In an electron discharge device a first cylindrical insulator, a disk-shaped electrode, and a second cylindrical insulator co-axially stacked in that order, said second insulator being indented adjacent said electrode to provide an annular shoulder spaced axially from said

electrode, an integral trough forming member supported on said shoulder and having an annular part in contact with said shoulder and a cylindrical part surrounding and spaced from adjacent peripheral portions of said

insulators and said electrode to provide a solder trough therewith and a body of solder in said trough bonding said insulators, said electrode, and said member together to provide a combined vacuum seal and electrode terminal for said device.

---

2,773,571
**WINDOW CASING CONSTRUCTION**
Clyde W. Kelly, Detroit, Mich., assignor to Fenestra Incorporated, a corporation of Michigan
Application September 14, 1953, Serial No. 379,793
21 Claims. (Cl. 189—75)



1. Combination trim comprising a pre-assembled frame consisting of a pair of vertical jamb members and a pair of horizontal members joined together at their ends to form a rectangular open weather side frame for insertion as a unit into the opening of a previously constructed window framing from the weather side thereof, a second preassembled frame consisting of a pair of vertical jamb members and a pair of horizontal members joined together at their ends to form a rectangular open room side frame for insertion as a unit into the opening of said previously constructed window framing from the room side thereof, securing means for joining said weather side frame to said room side frame after said frames have both been inserted in said opening, and a resilient insulating means separating said frames along their juncture, said securing means comprising a clip attached to one of said frames and a screw attached to the other of said frames.

---

2,773,572
**FLUID ACTUATED CONTROL SYSTEM**
John H. Province, Oklahoma City, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Original application July 24, 1948, Serial No. 40,587, now Patent No. 2,643,693, dated June 23, 1953. Divided and this application December 31, 1952, Serial No. 329,077
8 Claims. (Cl. 192—3.5)

1. A combination as disclosed comprising a rotatably mounted fixture, a manual rotatably mounted on said fixture, a pair of control devices, means operated by rotation of said fixture by said manual for effecting selective operation of said control devices, a third control device, and means actuable by rotation of said manual on said fixture for actuating said third device, said second means including a reciprocable plunger, and a cylindrical contact

member disposed between said manual and said plunger in floating relation thereto.

---

2,773,573
**INTERLOCK MECHANISM**
Nicholas M. Erisbil, Milwaukee, Wis., assignor to Caterpillar Tractor Co., Peoria, Ill., a corporation of California
Application January 7, 1955, Serial No. 480,349
3 Claims. (Cl. 192—4)

1. In shifting mechanism including forward and reverse gears for driving a rotatable drum, a ratchet on the drum, a pawl engageable with the ratchet to prevent reverse rotation thereof, locking means associated with the shifting mechanism to lock it against movement into reverse position, means connecting said pawl and locking means, and means operable through said connecting means to withdraw the pawl and release the locking means simultaneously.

---

2,773,574
**RATCHET ADAPTERS FOR SOCKET WRENCHES**
Edward T. Able, Denver, Colo., assignor to B. K. Sweeney Mfg. Co., Denver, Colo., a corporation of Colorado
Application March 8, 1954, Serial No. 414,564
6 Claims. (Cl. 192—43.1)

1. A socket wrench adapter comprising: a cup-shaped housing having a closed and an open extremity; a wrench-receiving stud concentrically projecting from the closed extremity of said housing; an annular series of internal, double-acting ratchet teeth formed in said housing; a tubular socket-receiving sleeve concentrically mounted in said housing and having a protruding extremity extending through the open extremity of said housing; an enlarged annular rim surrounding said sleeve within said

housing within said annular series of ratchet teeth; a plurality of swinging pawls mounted in said rim and adapted to engage said ratchet teeth, each of said pawls projecting in a tangential direction opposite to its two adjacent pawls so that they will be alternately right and left handed; resilient means urging said pawls into engagement with said ratchet teeth; a tubular shifting collar surrounding said socket sleeve and forming a supporting bearing for the protruding extremity thereof, said collar extending from the open extremity of said housing about said sleeve; a circular hub portion formed on said collar and bearing against the inner wall of said housing to maintain said collar concentric therein; means retaining said hub portion in said housing; and means on said hub portion adapted when the latter is rotated to pass between certain of said pawls and said housing so as to prevent the latter pawls from engaging said teeth.

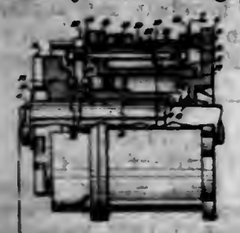
---

2,773,575
**MULTIPLE CLUTCH ARRANGEMENT**
Richard Ignatz Binder and Adolf Gustav Ludwig, Schweinfurt (Main), Germany, assignors to Firma Fichtel & Sachs A. G., Schweinfurt (Main), Germany
Application June 2, 1953, Serial No. 359,058
Claims priority, application Germany February 4, 1953
8 Claims. (Cl. 192—48)

1. In a double clutch of the class described, in combination with a main clutch member adapted to be rotated by driving means; two pressure plate means coaxially disposed in proximity to said main clutch member for rotation therewith and each independently axially movable with respect thereto, said pressure plate means being disposed to move axially in opposite directions toward said main clutch member; and two driven clutch members coaxially disposed with respect to said main clutch member, each driven clutch member comprising a portion extending intermediate said main clutch member and one of said pressure plate means and each independently adapted for individual connection to separate and independent power driven utilization means, the provision of: common resilient means acting simultaneously on both of said pressure plate means and urging both of said pressure plate means in opposite axial directions each toward said main clutch member to press both of said driven clutch members simultaneously and individually into driving engagement with said main clutch member; at least one generally radially extending clutch control lever; pivot means carried by said main clutch member and pivotally supporting said control lever intermediate its ends; a first clutch actuating means connected to one of said pressure plate means and connected to said control lever at one side of said pivot means and actuable by pivotal movement of said control lever through a first predetermined angle to cause axial movement of one of said pressure plate means against the action of said common resilient means away from said main clutch member to disengage one of said driven clutch members; a second clutch actuating means connected to the other of said pressure plate means and connected to said control lever at the other side of said pivot means and actuable by pivotal movement of said control lever through a second predetermined angle appreciably different from said first angle to cause axial movement of said other pressure plate means away from said main clutch member, whereby angular displacement of said control lever through the greater of said two angles will disengage both of said clutch members and displacement of said control lever through the lesser of said two angles will disengage only one of said clutch members.

---

2,773,576
**FRICTION CLUTCH**
Maximilien Stenger, Paris, France, assignor to Societe Anonyme Francaise du Ferodo, Paris, France
Application August 12, 1952, Serial No. 303,930
Claims priority, application France December 6, 1951
1 Claim. (Cl. 192—68)



A friction clutch comprising a flywheel, a cover plate fastened thereto, a pressure plate located between said flywheel and said cover plate, a driven shaft, at least one friction plate located between said flywheel and said pressure plate and mounted for axial sliding motion on, and rotary motion with, said driven shaft, clutch springs of the coil compression type bearing with one end on the inner face of said cover plate and with the other end on said pressure plate to urge same against said flywheel and press said friction plate or plates between said pressure plate and said flywheel, clutch release levers each mounted for rocking motion on a relevant intermediate oscillating member bearing on said cover plate, having an end portion pivoted on said presser plate to control the longitudinal movements thereof and another bearing end portion, a control member mounted for axial sliding motion on said driven shaft and adapted to move in the direction of said bearing end portions of said release levers for disengaging the clutch, a flat ring disposed between said bearing end portions of said clutch release levers and said control member, and rectilinear resilient blades extending in a plane close and parallel to said flat ring, and having one end pivotally mounted on said flat ring and the other end secured to said cover plate so as to extend also tangentially to the flat ring contour in the direction of movement of the assembly, said resilient blades being adapted resiliently to urge said flat ring for engagement with said bearing end portions of said clutch release levers and drivingly connecting said flat ring with said cover plate for rotation therewith.

---

2,773,577
**AIR VALVE WITH RING-TYPE PISTON**
Vladimir Kapeshko, Los Angeles, Calif.
Application May 12, 1953, Serial No. 354,678
2 Claims. (Cl. 192—85)

1. A device of the class described which comprises: a shaft, a plurality of splines on said shaft, a splined sliding member positioned on said shaft surrounding said splines, said member having an end adapted to serve as a clutch plate and an end adapted to serve as a brake surface, a ring-shaped cylinder positioned generally around said

sliding member so as to be coaxial with said shaft, means defining fluid passages adjacent to the ends of said cylinder, a ring-shaped double-acting piston positioned within said cylinder between said fluid passages, means defining a plurality of spaced apertures within one end of said cylinder, piston rods connected to said piston and projecting from said cylinder through said apertures, a

generally ring-shaped disc surrounding said sliding member and secured to said piston rods, bearing means connecting said disc to said sliding member so that as said disc is moved said sliding member is moved on said shaft, means attached to said cylinder adjacent to said brake surface adapted to serve as a brake surface, and means attached to said cylinder for securing said cylinder to a supporting surface.

---

2,773,578

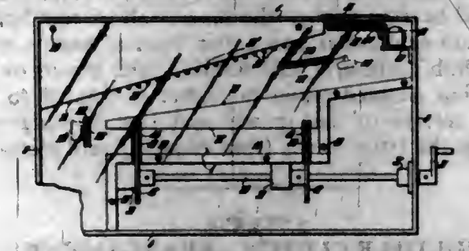
## ACTUATING MECHANISM FOR CLUTCHES

Stanley Frederick Burnett, Coventry, England, assignor to Self-Changing Gears Limited, Coventry, England

Application July 27, 1953, Serial No. 370,510
Claims priority, application Great Britain August 1, 1952
6 Claims. (Cl. 192—98)

1. Actuating mechanism for clutches comprising, in combination, an axially displaceable pressure ring for applying engagement pressure to the clutch surfaces, an intermediate ring member mounted upon said pressure ring with an interposed thrust bearing, a tiltable ring member connected to and supported by the intermediate ring member by diametrically opposed and radially inwardly directed pivotal connections, said tiltable ring member having a substantially uninterrupted outer periphery, abutment means engaging an end surface of the tiltable ring member within the outer periphery thereof at a point lying in a plane other than the plane of tilting of the tiltable ring member, a pivotally mounted bell crank member including an arm movable into and out of abutting relation with the said end face of the tiltable ring member within the outer periphery thereof and at a point diametrically opposite the engagement point of the aforesaid abutment means whereby clutch engagement pressure can be applied to said tiltable ring member by movement of said arm, and a fluid pressure operable piston operatively connected to said bell crank lever for applying such clutch engagement pressure.

---



2,773,579

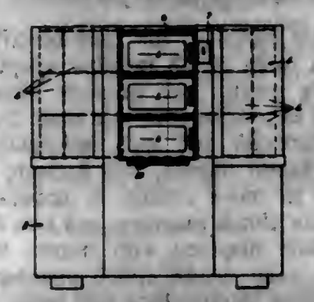
## ELECTRICAL INDICATING MECHANISM

Donald Lutes, Pittsfield, Mass.

Application October 9, 1953, Serial No. 385,141
2 Claims. (Cl. 194—8)

1. Apparatus of the class described comprising, a supporting structure including a rear plate and a front transparent panel secured together in vertical horizontally spaced planes for receiving therebetween discs in vertical planes and provided with a disc receiving entrance at the upper side and adjacent one end thereof, a slide member between said plate and panel having an upper elongated edge for rollably supporting and releasing a disc, operating means for moving said slide member up and down to position the upper edge thereof in various disc supporting positions and in lower disc releasing position, a row of relatively spaced contacts carried by said plate along and

above the upper edge of the slide member, said row of contacts and the upper edge of said slide member arranged in a generally declining and converging relation and generally horizontally from said disc entrance whereby a disc of a certain diameter on the upper edge of the slide member in one supporting position thereof will engage a contact different from that engaged by said disc in a different supporting position and successive movements of the slide member to disc releasing position will cause said disc to engage successive contacts.



---

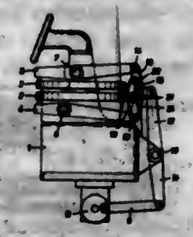
2,773,580

## VENDING MACHINES

Harald Swede, Malmo, Sweden, assignor to Bergbom & Co. A.-B., Malmo, Sweden, a corporation of Sweden

Application January 28, 1954, Serial No. 414,519
Claims priority, application Sweden January 30, 1953
6 Claims. (Cl. 194—54)

1. In a vending machine a roundabout adapted to hold merchandise in vertical rows and horizontal tiers, a vertical drive shaft for driving said roundabout and adapted to move continuously, means for stopping said roundabout, bearing balls supporting said roundabout on said vertical drive shaft, a coin mechanism, rod means in said stop means corresponding in number to the vertical rows of merchandise mounted for swinging movement in vertical direction and lengthwise movement tangentially to said roundabout, ear means arranged in pairs at different distances from the axis of said roundabout, one of said ear means in each of said pair of ear means being mounted on one of said rod means, the other one of said ear means in each of said pair of ear means being mounted on said roundabout and in register with one of the vertical rows of merchandise, manually operable levers acting on said rod means in vertical direction, a key on an outer end of each of said manually operable levers, and biased levers between said rod means and said coin mechanism transferring the lengthwise movement exerted on said rod means by said roundabout before a standstill for changing said coin mechanism.



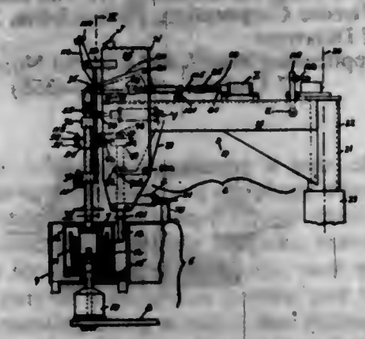
2,773,581

## IMPRESSING MACHINES FOR ADDRESS-PRINTING AND LIKE PRINTING PLATES

Erich Ostwaldt, Berlin-Hermsdorf, and Heinrich Ditzel, Berlin-Niederschoenhausen, Germany, assignors to Adrema Maschinenbau G. m. b. H., Berlin, Germany

Application April 29, 1952, Serial No. 284,957
5 Claims. (Cl. 197—6.7)

1. In an embossing machine for address-printing and similar plates, having two adjustable typewheels arranged co-axially, one of said wheels having the pressing stamps and the other of said wheels having the corresponding matrices, the combination of a frame; two substantially straight double-armed levers pivoted on said frame and adapted to co-act with said wheels, respectively, to emboss a plate; a toggle-joint connecting one end of each of said levers; a double-armed driving lever pivoted on said frame; means for rocking said driving lever; a link connecting said toggle-joint with said driving lever and adapted to exert pressing action on said toggle-joint to rock said double-armed levers, when said driving lever is rocked; and an auxiliary device actuated by said driving lever and adapted to act on that one of said two double-armed levers which co-acts with said wheel having the matrices, to hold the matrix-wheel-co-acting lever, in its working position, to fix it with respect to said frame, shortly before said toggle-joint effects pressing action.



---

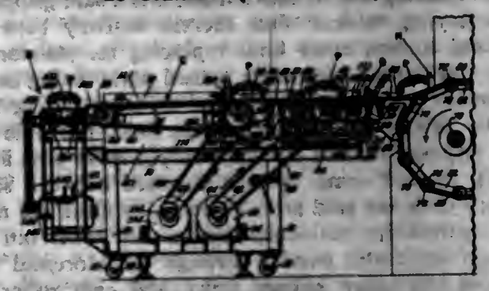
2,773,582

## ARTICLE EXTRACTING DEVICE

Ivanhoe P. Demyanen, Merion Station, and Frank Radberg, Philadelphia, Pa., assignors to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware

Application December 24, 1954, Serial No. 477,548
12 Claims. (Cl. 198—20)

1. In a system for handling articles comprising a conveyor member which continuously traverses a fixed path and has means uniformly spaced along the member for supporting separate articles; the conveyor member having a plurality of detents, each detent having fixed identical relation to one of said means and the path; an article-supporting member in spaced later relation with the conveyor; an apparatus operating in successive cycles to transfer articles from one member to the other, comprising means for gripping one of said articles, a primary supporting means, reciprocable means carried by the primary supporting means having an ambit of reciprocation relative to the primary means extending in a direction toward and away from the members, a movable secondary supporting means for said primary means, stationary means for supporting said secondary means and limiting the movement of the secondary means to ambit parallel to said path, means for pivotably connecting portions of the primary means remote from the path of the secondary means along an axis substantially parallel to the path, an element supported by the secondary means for movement relative thereto into and out of a position for engagement with successive detents, and a jack having one end connected with said primary means and its other end connected with said element for the simultaneous application of force in opposing directions for swinging the free end of the primary means away from the secondary means and moving the element out of said position for engagement with a detent.



---

2,773,583

## UNLOADING DEVICE

Kenneth R. Rand, Branford, and Ernest Brandenberger, New Haven, Conn., assignors to American Machine & Foundry Company, a corporation of New Jersey

Application May 14, 1954, Serial No. 429,722
13 Claims. (Cl. 198—21)

1. The combination of an unloading conveyor adapted to be positioned at the delivery end of a moving hearth plate conveyor, a stationary support and a track means thereon, a carriage mounted for reciprocation on said track, a walking beam conveyor mounted on said carriage, said walking beam conveyor being formed of a plurality of longitudinal members, at least one of said plurality of longitudinal members being adapted and constructed to move as a walking beam, yieldable means urging said carriage toward one end of said track, a cam surface on said carriage positioned to engage moving members on said moving hearth oven to move said carriage on said track against said yielding member whereby the leading edge of said walking beam conveyor may follow for a short period a trajectory of the delivery edge of the hearth plate of said traveling hearth oven.

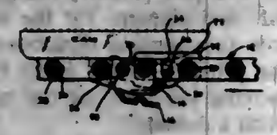
---

2,773,584

## PIVOT FLIGHT CONVEYOR

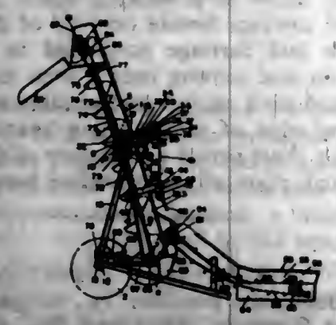
Neal W. Densmore, Franklin, Pa., assignor to Joy Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania

Application January 24, 1955, Serial No. 483,653
4 Claims. (Cl. 198—176)



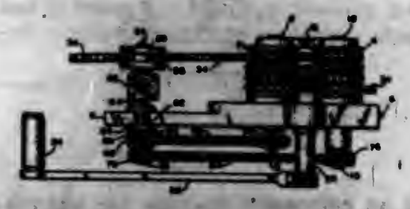
1. In a conveyor, in combination, an elongated deck plate having an endless channel formed therein, a circulating chain beneath said plate and lying in a generally horizontal plane, a plurality of flights lying adjacent the upper surface of said deck plate, a plurality of lugs secured to said chain and extending upwardly through said channel, said flights being pivotally secured one to each of said lugs for pivotal movement in a generally horizontal plane, and means to limit the pivotal movement of said flights in one direction throughout a portion of their orbital movement with the torsional load on said flights through said portions of their movement being transmitted through said lugs to said deck plate.

2,773,585



2,773,587

2,773,585
SINGLE CHAIN GRIPPER
Joseph R. Canfield, West Norwood, N. J., assignor to Champlain Company, Inc., Bloomfield, N. J., a corporation of New York
Application July 27, 1953, Serial No. 370,541
12 Claims. (Cl. 198—189)



2. In combination, a single roller chain having conventional outer and inner links connected by conventional pins and rollers spaced apart by a desired pitch, a sprocket wheel mating with said chain but having teeth spaced at only half the pitch of the chain, and a gripper assembly built into and forming a part of said roller chain at desired intervals, said gripper assembly comprising inner links replacing the standard inner links, said gripper inner links having vertical slots therein halfway between the adjacent rollers, outer links replacing the standard outer links and having outwardly turned parts acting as spaced stationary gripper jaws, pivoted arms extending longitudinally of the chain alongside the links, movable gripper jaws disposed outside the stationary gripper jaws and connected to said arms, springs disposed between said stationary jaws and said arms to normally close the movable jaws against the stationary jaws, a cam roller pin carried by said arms and passing through the aforesaid vertical slots in the inner gripper links, and cam roller means rotatably carried on said cam roller pin.

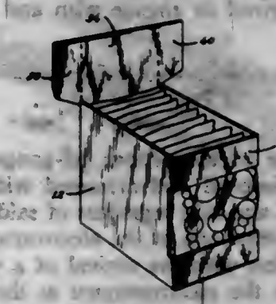
2,773,586
ELEVATOR CONVEYOR
Edward H. Schmidtke, Marble Rock, Iowa
Application August 3, 1953, Serial No. 371,984
1 Claim. (Cl. 198—233)

A foldable elevator comprising an upper body section and a lower body section pivotally connected together, means to hold said upper and said lower sections in alignment, said lower section being supported on an axle, said axle having a king bolt pivotally disposed therein at each end thereof, a hub integrally attached to the lower end of each said king bolt, said axle resting on said hubs, a wheel on each said hub, a lever fixedly attached to the upper end of each said king bolt and extending laterally therefrom above said axle and disposed generally perpendicular to said hubs, and a link pivotally attached to said axle on the upper side thereof holding said wheels in an unswung position, the end of said lever remote from said king bolts being attached to the distal end of said link, said remote end of said lever being adapted to be attached to the point of connection of said lever to said axle whereby said hubs with said wheels thereon are rotated in a horizontal plane from a position parallel to said axle to a position at approximately a right angle to said axle.

2,773,587
WINCH WITH AFTER DRAG ROLLERS
Lyman Middleditch, Jr., Albuquerque, N. Mex., assignor to the United States of America as represented by the Secretary of the Army
Application March 16, 1954, Serial No. 416,727
1 Claim. (Cl. 242—200)
(Granted under Title 35, U. S. Code (1952), sec. 266)

A line winch comprising a frame, first and second shafts extending transversely through said frame, a drum carried on each of said shafts, each of said drums having a plurality of opposing similar grooves in register on the respective outer peripheries of each of said drums whereby said line is continuously wound about the grooves of the drums, means operatively associated with said shafts for effecting mutual rotation thereof, first and second sprockets mounted respectively on each of said first and second shafts on one side of said frame, tensioning means for said line comprising third and fourth shafts extending transversely through said frame, each having first and second ends, a pair of aligned substantially coplanar friction wheels, each of said wheels being positioned on the first ends respectively of said third and fourth shafts on the other side of said frame relative to said sprockets, third and fourth sprockets mounted respectively on the second ends of said third and fourth shafts, said third and fourth sprockets being respectively in register with said first and second sprockets, and discrete chain drives linking said sprockets in register for effecting mutual rotation of said drums and wheels.

2,773,588
TOW ROLL
George Downing, Parkersburg, W. Va., assignor to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware
Application May 7, 1954, Serial No. 428,272
7 Claims. (Cl. 242—355)



1. A corrugated roll for processing yarn filaments such as tow and the like comprising a cylindrical member, journal means for said member, a lead coating on the periphery of said member, and a plurality of elongated glass elements anchored in said coating to form axially extending corrugations around said periphery.

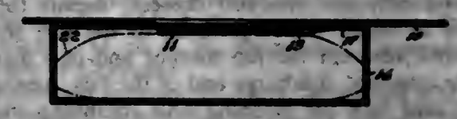
2,773,589
DISPLAY CARTON
Russell J. Hennessey, St. Paul, Minn., assignor to Waldorf Paper Products Company, St. Paul, Minn., a corporation of Minnesota
Application June 28, 1952, Serial No. 296,222
1 Claim. (Cl. 206—44.11)

A display carton in combination with a series of articles to be displayed, the carton including a series of

rectangularly arranged wall panels, one of which forms a front wall display panel and the two adjoining wall panels forming side walls, a pair of spaced cut lines extending across said display panel and into said side walls, a fold line connecting the adjacent ends of said cut lines, said articles to be displayed being of a size to fit between said side walls and substantially the full height of the display panel and substantially the full width thereof, several such like articles being arranged one behind the other between said display panel and the opposite

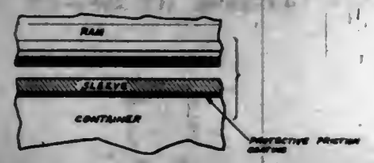
wall panel, the strip defined by said cut lines and fold lines being folded inwardly into parallel relation to the display panel and spaced therefrom, the space between the strip and display panel being slightly greater than the thickness of one article, one article of the series being held upright closely adjacent to said display panel by said strip and visible through the opening in the display panel caused by folding the strip inwardly, said strip defined by said cut lines being of sufficient height to support said one article in upstanding position.

2,773,590
DISPLAY CONTAINER
Benjamin L. Levinson, Groton, Conn., assignor to Royal Electric Company, Inc., Westerly, R. I., a corporation of Rhode Island
Application January 8, 1954, Serial No. 402,879
16 Claims. (Cl. 206—45.34)



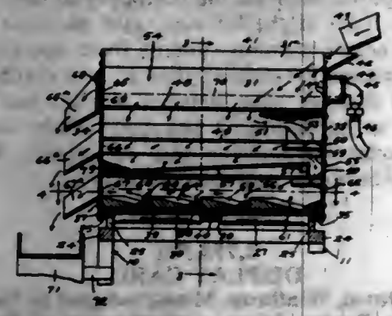
6. A display container comprising a pair of similar sections each having a star-shaped periphery when viewed in plan and comprising a comparatively small central portion with concave receptacle portions radiating out therefrom, one for each point of the star, each star point constituting a part of a receptacle portion and being defined by walls meeting along a radial line inclined downwardly from the tip of said point, said walls being inclined upwardly and outwardly from said line and extending radially inwardly short of said central portion from the tip of said point, the upper edges of said walls defining the periphery of said part, the remainder of each receptacle portion being defined by walls meeting along a radial line intersecting said first mentioned radial line and inclined upwardly therefrom toward said central portion, said walls being inclined upwardly and outwardly from said line and intersecting the adjacent walls of adjacent receptacle portions, said sections being secured together with their corresponding receptacle portions registering and opening toward one another so as to define individual compartments, one of said sections being transparent over its receptacle portions, whereby articles placed within said compartments will be retained and visible therein.

2,773,591
VESSEL WITH STERILE CLOSURE FOR SEPARATE STORAGE OF AT LEAST TWO SUBSTANCES
Erik Jensen, Copenhagen-Vanlose, Denmark, assignor to Novo Terapeutisk Laboratorium A/S, Copenhagen, Denmark, a limited liability company of Denmark
Application October 15, 1953, Serial No. 386,318
Claims priority, application Denmark October 22, 1952
4 Claims. (Cl. 206—47)



1. A sterile closed vessel for separate storage of at least two substances which are adapted to be intermixed before use which comprises, means defining a housing having at least one open end, a transverse partition in said housing dividing it into adjacent compartments for the respective reception of said substances, a resilient diaphragm closing an open end of said housing, and a member extending between said diaphragm and said partition for displacing said partition inwardly of said housing upon inward movement of said diaphragm, said partition comprising a disc-shaped body and an elastic ring having a substantially circular cross-section frictionally disposed between the periphery of said body and the inner surface of the housing, said partition normally sealing the adjacent compartments from one another but inwardly-directed pressure applied to said diaphragm and transmitted through said member to said body causing said body to be displaced inwardly while said elastic ring rolls over the housing wall to provide free communication between said compartments.

2,773,592
DISPLAY CARD
Ernest H. Duval, Winthrop, Mass., assignor to The Gillette Company, Boston, Mass., a corporation of Delaware
Application November 21, 1952, Serial No. 321,863
1 Claim. (Cl. 206—79)



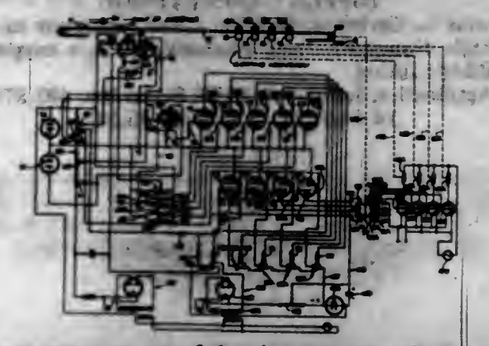
A merchandise display card of resiliently foldable material in combination with a flat-walled merchandise carton, said carton having a transverse securement slit in one of its flat-walled portions, said card having a longitudinally-extending tongue, struck therefrom, inserted into the carton slit, the base portion of the tongue being partially separated from the card by two short tongue slits extending part way towards each other from the respective sides of said tongue and aligned with the carton slit, and a pair of relatively short locking ears, struck from the integral with said tongue, disposed at opposite ends of the base portion of said tongue, said ears being bounded in part by the aforesaid tongue slits and having fold lines parallelling the longitudinal direction of the tongue about which said ears are folded inwardly, the card and carton assembly positioned with one edge of the carton slit in engagement with the facing edges on the card side of the tongue slits, and the edges of the ears bounded by the tongue slits in obstructive engagement with the opposite facing edge of the carton slit, thereby positively to prevent relative longitudinal movement between the carton and the card in either direction.

2,773,593
METHODS OF EXTRUDING HIGH COPPER ALLOYS
William F. Schmollinger, North Woodbury, Conn., assignor to Chase Brass & Copper Co. Incorporated, Waterbury, Conn., a corporation of Connecticut
Application February 27, 1953, Serial No. 339,331
8 Claims. (Cl. 207—10)

1. The method of extruding high-copper alloy rod or tube at relatively high temperatures which comprises providing a high-copper alloy billet with a coating of high-temperature refractory material adapted to increase friction between the surface of the billet and the wall of the extrusion press container, and extruding the core of the coated billet at suitably elevated temperature from such container through a die while leaving substantially a full sleeve on the container wall.

2,773,594
GRAVEL AND SAND WASHER AND CONCENTRATOR
Clarence C. Tyer, Vallejo, Calif.
Application August 6, 1954, Serial No. 448,369
8 Claims. (Cl. 209—13)

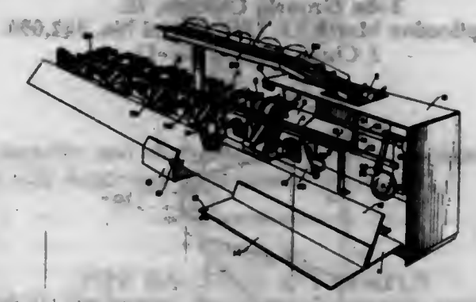
1. In a machine of the character described, an elongated washing and concentrating box, means for supplying raw materials to be processed to the upper portion of said box adjacent one end thereof, means for supplying jets of water under pressure to the box through said end and adjacent the top thereof and in a direction toward the opposite, discharge end of the box, means contained in said box for washing and scrubbing the raw material while submerged in water and for separating therefrom and entrapping the heavier valuable parts separated from the raw materials, said outlet end of the box having at least one discharge port through which the waste material is carried off, supporting means on which said box is supported for reciprocating movement transversely of the longitudinal axis of the box, and driven agitating means connected to said box for imparting a violent reciprocating and oscillating motion to the box in a direction transversely thereof.



2,773,595
CLASSIFYING APPARATUS
Henry C. Westin, Turtle Creek, Pa., assignor to United Engineering and Foundry Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application November 20, 1951, Serial No. 257,277
4 Claims. (Cl. 209—74)

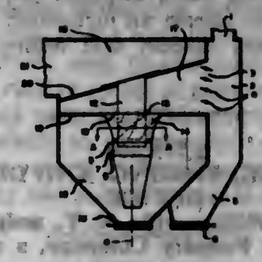
1. Apparatus for classifying and sorting according to thickness workpieces such as tin plate and the like comprising a conveyor defining a normal path of travel for said workpieces, a gauging means, a piler adjacent to and for receiving from said conveyor on-gauge workpieces having thicknesses within predetermined limits, a second piler adjacent to and for receiving from said conveyor workpieces having thicknesses less than those within said limits, a third piler adjacent to and for receiving from said conveyor workpieces having thicknesses greater than those contained within said limits, adjacent to each of said second and third pilers and serving as conveyor rolls for said conveyor an annular rotary electromagnet having a plurality of separately energizable segmental members spaced around the periphery thereof adapted to be selectively energized to engage with and to direct an

off-gauge workpiece to the proper off-gauge piler, control elements so disposed and arranged with respect to said gauging means and said segments of said electromagnets to energize at least one of the electromagnetic members in timed relation with the arrival of a workpiece at a point adjacent to the electromagnet at the proper off-gauge piler thereby to cause said members to engage with and deflect the workpiece out of its normal path of travel and to de-energize said member at a point beyond said point of energization and stripping means adjacent to each of said rotary electromagnets for assisting in releasing a workpiece from said magnets.

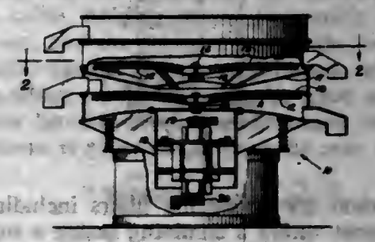


2,773,596
COMESTIBLE SORTING APPARATUS
Harold W. Bartlett, Berkeley, Calif., assignor to California Packing Corporation, San Francisco, Calif., a corporation of New York
Application June 23, 1951, Serial No. 233,232
12 Claims. (Cl. 209—111)

9. In an arrangement of the character described, article conveying means, means at a point of selection for deriving a voltage which varies in accordance with physical characteristics of articles on said conveying means, a magnetizable member synchronously operated with said conveying means, a plurality of magnetizing means magnetically associated with said magnetizable member to magnetize different regions in the same, a first plurality of gaseous discharge tubes each having its anode serially connected with a corresponding one of said magnetizing means, a single condenser serially connected with each of said magnetizing means and corresponding anodes and corresponding tube cathodes to provide a discharge path for said condenser, a continuous voltage source, a resistance serially connected with said source, a charging circuit for said condenser comprising said resistance and said source, a second plurality of discharge tubes each effective to energize a corresponding one of said first plurality of tubes in accordance with the magnitude of said voltage, each of said second plurality of tubes being energized through said resistance, a control tube operated in accordance with said voltage for deenergizing each of said first plurality of tubes, a plurality of pickup means magnetically associated with said magnetizable member and each corresponding to a corresponding one of said magnetizing means, and control means coupled to said pickup means for effecting control operations on said articles remote from said point of selection.



2,773,597
EGG GRADER
Elmer J. Green, Chicago, Ill.
Application August 9, 1952, Serial No. 303,550
15 Claims. (Cl. 209—121)



6. In an egg grader, an inclined runway comprising a weighing segment tiltable longitudinally of the runway, a dumping segment normally alined with said weighing segment and tiltable laterally for discharging eggs from the runway, a balance beam controlling the movement of said weighing segment, latch means controlled by said balance beam for locking said dumping segment against tilting, a receiving magazine for eggs located above said runway and comprising a chute shaped and disposed to deliver eggs by gravity in single file succession, a bucket movable vertically by the weight of an egg from an elevated position for receiving the egg from said chute to a depressed position for delivering such egg to said runway, a balanced supporting means for said bucket normally urging same upward to its egg receiving position, and timing means controlling the descent of said bucket.

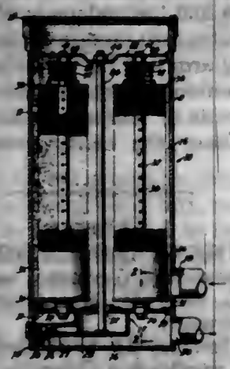
2,773,598
APPARATUS FOR THE SELECTIVE AND/OR TOTAL SEPARATION AND COLLECTION OF PARTICLES FROM SUSPENSION IN FLUID MEDIA
Pio Federico Falcopa Castelfranci, Milan, Italy, assignor to Termokimik Corporation, Milan, Italy, a corporation of Italy
Application April 1, 1953, Serial No. 346,175
23 Claims. (Cl. 209—144)

20. In apparatus for separating particles from suspension in fluids, an element comprising a generally frusto-conical hollow member, the large end of which forms a fluid inlet section having a substantially greater cross-sectional area than the cross-sectional area of the smaller end, at least one substantially helical internal vane beginning adjacent the inlet end of the frusto-conical member and extending to the opposite end thereof with gradually decreasing cross section, said vane forming a cylindrical axial passage adapted to receive a hollow cylindrical discharge element whereby a helical passage of decreasing cross section is formed between said discharge element, the vane and the frusto-conical member imparting a controlled, rapid increase in the velocity of the fluid passing therethrough.

2,773,599
SCREEN CLEANING DEVICE
John Litus, Carteret, N. J., and Charles D. Smith, Lawrence, Kans., assignors to Food Machinery and Chemical Corporation, New York, N. Y., a corporation of Delaware
Application October 19, 1953, Serial No. 386,710
4 Claims. (Cl. 209—386)

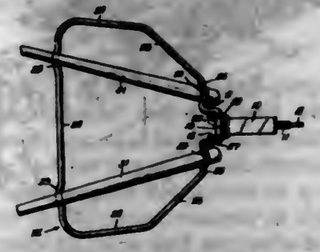
1. A screen cleaning device adapted for use between the screen and tray of a circular vibratory separator having a horizontal rotary component of movement and a vertical vibratory component of movement, comprising: oppositely, radially extending upwardly bowed resilient arms loosely pivoted, at the center of and below the screen and above the tray, about a center post, and extending between the screen and tray, said arms being spaced from the tray at all points, a cleaning medium positioned upon the upper surface of at least one of said arms adapted to engage the underside of said screen substantially throughout the length of said arm; and spacing means on said center post and bearing on the top of said screen adapted to regulate the spacing between said cleaning medium and the underside of said screen; whereby the circular vibratory motion of the screen is imparted to the supporting arm and the cleaning medium, resulting in a wave-like motion and intermittent tapping and brushing of the underside of said screen during the revolutions of the arms about the center post, subtantially as described.

2,773,600
PLANT FOR THE CLARIFICATION OF SLURRIES
Erich Riedel, Duesseldorf, Germany, assignor to Bruecken-bau Flender G. m. b. H., Duesseldorf, Germany, a corporation of Germany
Application January 21, 1953, Serial No. 332,198
Claims priority, application Germany January 29, 1952
1 Claim. (Cl. 210—51)



A device for the clarification of slurries and particularly of water comprising a circular settling tank, a circumferential trough at the upper edge of said settling tank for charging the slurries into said tank, a plurality of circular rows of overflow discharge tubes concentrically located in said tank at substantially the same level as said charging trough, overflow funnels attached to the open top of said tubes and connected therewith for the discharge of the clarified slurries, a turnstile located at the top portion of said tank the outlets from said turnstile extending into the circumferential charging trough and circular guide plates for the liquid to be discharged, said plates being attached to the bottom portion of said tubes and inwardly inclined towards the center of said tank.

2,773,601
**METHOD FOR CONSTRUCTING WATER FILTERS AND PRODUCT THEREOF**
Philip B. Keller, San Jose, and Walter M. Kofford, Santa Clara, Calif., assignors to R. T. Collier Corporation, Los Angeles, Calif., a corporation of California
Application September 21, 1953, Serial No. 381,416
12 Claims. (Cl. 210—120)

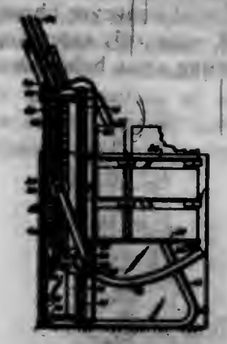


1. A method for producing filters including: placing upon a support within a confining casing a support layer of loose granular material commingled with unset binder substance; depositing upon the support layer a bed of loose filter material; placing upon the top of said bed a second layer of loose granular material commingled with unset binder substance; and treating the resultant assembly in said casing to harden said binder substance in the two layers in situ on said support and within said casing.

2,773,602
**FILTER APPARATUS**
Walter G. Sylvester, West Caldwell, N. J., assignor to Specialties Development Corporation, Belleville, N. J., a corporation of New Jersey
Application February 2, 1953, Serial No. 334,511
3 Claims. (Cl. 210—166)

1. In filter apparatus of the class described, a casing; a partition in said casing dividing said casing into upper and lower chambers, said upper chamber having an unrestricted inlet and said lower chamber having an unrestricted outlet and said partition having an aperture therein and a by-pass passageway for establishing flow communication between said upper and lower chambers, a stack of apertured, edge-type filter discs in said upper chamber; a tube extending through the apertures of said filter discs, said tube having a closed upper end, perforations adjacent said discs for receiving filtered liquid passing therethrough and an open lower end extending into said partition aperture for delivering the filtered liquid to said lower chamber; a downwardly facing valve seat in said tube adjacently spaced from its open lower end and located below the perforations thereof; a valve member for said seat; yieldable means for urging said valve member on its seat to normally resist delivery of filtered liquid from the open lower end of said tube to said lower chamber and thereby create a back pressure in said filter stack which serves to improve the rate of flow of liquid through said filter discs when the same have become contaminated with dirt particles and tend to resist the flow of liquid therebetween; and a normally closed check valve in said passageway adapted to be opened by the pressure of the liquid in said upper chamber in response to a pressure greater than that required to unseat said valve member.

2,773,603
**COMBINED FISH BAG HOLDER AND FISHING POLE REST**
John Gronek, Chicago, Ill.
Application March 13, 1953, Serial No. 342,090
1 Claim. (Cl. 211—1)



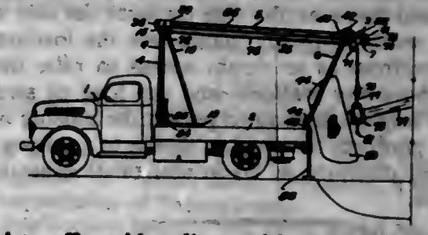
A fish bag holder and a fishing pole rest comprising a fish bag supporting frame, said frame including a straight side having a pair of widely spaced apart, upwardly opening notches therein each adapted to receive a fishing pole and support it from below, end members extending from said straight side in a substantially perpendicular relation therewith, side members extending from the ends of said end members, each of said side members being in a substantially parallel relation with said straight side and having a downwardly opening notch therein adapted to receive a fishing pole and engage it from above, the space between said downwardly opening notches being substantially less than the space between said upwardly opening notches so that a fishing pole supported by one of said upwardly opening notches and the downwardly opening notch adjacent thereto will be in a diverging relationship with respect to a fishing pole supported by the other two of said notches, a pair of parallelly disposed arms extending from the ends of said side members, said arms being in a substantially perpendicular relation with said side members and said straight side, a pivot extending laterally from the end of each arm, and bracket means for connecting said frame to the side of a boat and supporting said frame in position over the water adjacent the side of the boat, said bracket means having an opening therein for receiving said pivots and having a pair of bearing portions upon which said arms may rest, said bearing portions being disposed above said pivot-receiving opening to impart an inclination to said frame so that said notches support said fishing poles at the proper inclination.

2,773,604
**SELF-LEVELING, STORING, AND DISPENSING DEVICE**
George A. Gruss, Williamsville, N. Y., assignor to American Machine & Foundry Company, a corporation of New Jersey
Application December 29, 1952, Serial No. 328,495
4 Claims. (Cl. 211—49)

1. A self-leveling, storing, and dispensing apparatus comprising a substantially vertical framework, vertical guides connected to said framework; a material supporting platform having rollers engaging with said guides to limit said platform to relative movement with respect to said guides, counterbalancing means coacting with said platform to maintain the top of the material supported thereon at a constant level with respect to said framework by exerting a force which is proportional to the distance moved by said platform, a vertical shaft connected to said framework, a sliding member coacting with said shaft

to allow said platform to move in only one direction relative to said shaft, and means for moving and maintaining

said member and shaft out of operative engagement to allow said dispensing apparatus to be loaded.



2,773,605
**PIPE RACKING APPARATUS**
Frank D. De Jarnett, Barcelona, Venezuela, assignor of one-half to Paul A. Modearis
Application November 12, 1953, Serial No. 391,682
33 Claims. (Cl. 214—2.5)

1. Apparatus of the character described for racking and unracking stands of pipe adjacent a well bore, said apparatus having in combination: a plurality of lower support units to support a corresponding plurality of rows of stands of pipe, each of said units having one end adapted to receive the lower ends of stands of pipe, each of said units being adapted to shift the lower ends of the stands of pipe successively to or from its receiving end; a corresponding plurality of upper rack units to engage upper portions of the rows of stands of pipe on said lower support units, each of said rack units having one end adapted to receive stands of pipe from the well bore, each of said rack units being adapted to shift the stands of pipe successively to or from its receiving end; and power means to actuate said support units and said rack units for racking and unracking stands of pipe.

2,773,606
**TREE MOVING APPARATUS**
Marvin A. Shepherd, Mission, Kans., assignor to Williams & Harvey Nurseries Company, Prairie Village, Kans., a corporation of Missouri
Application September 8, 1953, Serial No. 378,731
3 Claims. (Cl. 214—3)

1. A tree moving apparatus adapted for mounting on the bed of a truck including, a forward support adapted for fixed connection with the forward end of the bed, a boom, means on the fixed support for pivotally and slidably mounting one end of the boom for movement in the longitudinal direction of said bed, brackets adapted for fixed attachment at opposite sides of the rear end of the bed, a rear support comprising a yoke member having legs pivotally connected with said brackets for swinging movement on a fixed axis, means on the rear end of the boom and engaging the yoke for forming a fixed pivotal connection therewith for projecting and retracting the boom with respect to the rear of said bed, said boom providing a rigid track along the length thereof, a trolley movable along the track formed by the boom, a pulley carried by the trolley, a pulley carried by the fixed support, a lifting cable operating over the pulleys and having one end adapted for connection with the trunk of the tree near the ball thereof, a windlass for winding the other end of the cable, holding means removably engageable with the boom and the forward end of the trolley to secure the trolley against retractive movement on the boom, a similar holding means between the fixed support and the boom for limiting retractive movement of the boom when the boom is projected beyond the rear end of said

bed and to affix said trolley and boom so that winding of the cable on the windlass effects lifting of the tree to a position above the bed of the truck, means for connecting the trunk of the tree with the trolley independently of the lifting cable when the tree is in said position to carry the ball end of the tree by the trolley, a pulley on the rearward end of the boom and adapted to reeve the lifting cable when the cable is attached to an upper portion of the trunk of the tree and while the ball end is supported from the trolley to effect movement of the trolley rearwardly along the boom when said holding means is disengaged from the trolley to move the tree carried thereby toward the forward end of the truck bed upon further operation of the windlass and to shift the boom forwardly upon continued operation of the windlass when the boom holding means has been removed.

2,773,607
**MATERIALS PILING DEVICES**
Burton H. Locke, Framingham, Mass.
Application September 27, 1954, Serial No. 458,340
16 Claims. (Cl. 214—6)

1. A device to facilitate the piling of articles of merchandise onto a carrying platform in successive layers comprising a stationary frame structure and a swingable structure pivotally mounted near one end thereof to the frame structure and disposed to swing upwardly, a portion of said swingable structure near the other end thereof being suitable to receive and support a said platform, means to convey articles of merchandise to a predetermined level above the structures at the platform supporting end thereof, the swingable structure being such as to receive and swing an empty said platform upwardly in

position to facilitate the sliding of a layer of said articles thereon substantially at the said predetermined level and thereafter to swing downwardly therefrom intermittently to suitable positions to bring the top of each successive layer of articles that may be placed on the platform substantially at the said predetermined level to facilitate the sliding of each layer of articles onto the preceding layer respectively, and so on, until said platform is completely loaded with articles, and finally to permit the removal therefrom of any platform that may be loaded thereon, power means to accomplish the movement of the swingable structure, a substantial upright fence on the swingable structure intermediate the pivot point thereof and the platform supporting portion thereof for locating the packages thereagainst, adjustable means to position said platform in horizontal relationship to said fence, an upright movable package locating fence on one of the members disposed adjacent to and substantially perpendicular to the first said fence on the side opposite the side where an operator would normally manipulate the loading of a platform therefrom as set forth, means to raise the last said fence above any platform and any load of packages that may be formed thereon to permit the passing of any such loaded platform thereunder, means to facilitate positioning a said platform in horizontal relationship to the last said fence.

2,773,608

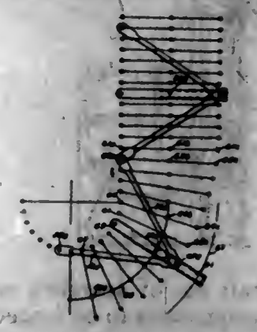
## MATERIAL HANDLING APPARATUS OF THE CONVEYOR TYPE

Robert E. Hunt and James Nagy, Butler, Pa.

Application November 25, 1955, Serial No. 549,006
8 Claims. (Cl. 214—14)

1. Apparatus for unloading barges, comprising a cable for holding a floating barge in sidewise relation to a dock, a motor-driven winch for shifting the barge longitudinally, an operator's cab, a boom-like main conveyor frame pivoted at its inner end to the cab, for swinging movement of its outer end in a vertical plane, means for swinging the cab and the conveyor frame on a vertical axis, an auxiliary conveyor frame slidably projecting from the lower end of the main frame, pulleys on the inner end of the main frame and on the outer end of the auxiliary frame, respectively, and a looped conveyor belt passing around said pulleys and arranged to receive material at the lower outer end of the auxiliary frame and discharge it at the upper end of the main frame.

---



2,773,609

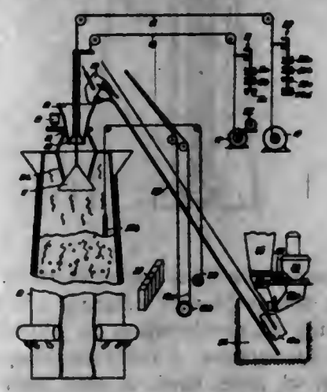
## AUTOMOBILE PARKING MACHINE

John E. Holappa, Detroit, Mich., assignor to H. E. Beyster & Associates, Inc., Detroit, Mich., a corporation of Michigan

Application October 24, 1952, Serial No. 316,716
7 Claims. (Cl. 214—16.1)

1. An automobile parking machine comprising structural framework extending to multiple automobile height, opposed, endless, vertical chain conveyors each passing over axially spaced upper and lower sprockets, said sprockets being rotatably supported by said framework, a plurality of individual automobile cradles pivotally suspended between said conveyors, cradle suspension linkage connecting said cradles to said conveyors at points providing substantially minimum clearance spacing between adjacent loaded cradles in vertical travel, said linkage comprising cradle suspension arms pivotally connected to and extending outwardly from said chain conveyors, each arm having a cradle suspension point substantially spaced from the respective ends thereof and outside of the path of travel of said conveyor chain, a pair of supporting arms for each outwardly extending cradle suspension arm, said supporting arms being pivotally connected

to said chain conveyor at points oppositely spaced from the chain connection of said outwardly extending arm, the outer ends of said supporting arms being pivotally connected to each other and slidably connected to said outwardly extending arm outside of its cradle suspension point.



---

2,773,610

## PROGRAM CONTROL AND INDICATING SYSTEM

Albert Mohr, Jr., and John P. Grill, Chicago, Ill., assignors to John Mohr and Sons, Chicago, Ill., a corporation of Illinois

Application December 11, 1953, Serial No. 397,584
21 Claims. (Cl. 214—19)

1. In a charging program control and indicating system for a blast furnace wherein the coke, ore and stone are adapted to be conveyed by skip hoist means to a hopper provided with a cooperating bell, the combination of a series of manually presettable ore and stone designating switches adapted to be preset in accordance with a predetermined skip load charging program, rotary switch means adapted to be actuated by said skip hoist means, and indicating means responsive to the manually preset positions of said designating switches and to the operation of said rotary switch means for indicating the material to be loaded into the skip hoist means in the successive trips of the charging program.

---

2,773,611

## METHOD OF AND APPARATUS FOR FEEDING VITRIFIABLE MATERIALS INTO GLASS FURNACES

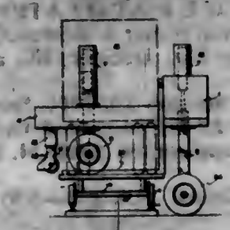
Georges Leon Henry and Edgard Brichard, Jumet, Belgium, assignors to Union des Verreries Mecaniques Belges S. A., Charleroi, Belgium, a Belgian company

Application August 4, 1949, Serial No. 108,555
Claims priority, application Belgium August 23, 1948
6 Claims. (Cl. 214—35)

1. Apparatus for proportionally feeding different granular vitrifiable materials into a glass furnace, comprising a forebay of said furnace having spaced side walls and

adapted to contain molten glass, a central hopper having a discharge opening extending transversely of the forebay and its ends spaced from the sides of the forebay, an impeller under said central hopper and operable to impel material issuing from the hopper toward the furnace so as to cover with said one material a central portion of the glass surface as wide as the discharge opening of the central hopper and extending therefrom toward the furnace, said impeller being effective to create

a surface current in the glass wider than said central portion and flowing toward the furnace, and an auxiliary hopper having a discharge opening extending over a side portion of the glass surface extending parallel to said central portion, said side portion being subject to said surface current so that material issuing from said auxiliary hopper is fed toward the furnace at a rate proportional to the rate of feeding of material from the central hopper.



---

2,773,612

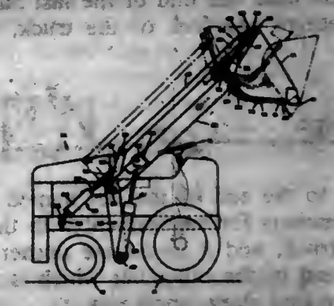
## APPARATUS FOR LOADING AND UNLOADING TRAILERS AND THE LIKE ONTO AND FROM PLATFORMS AND THE LIKE

Russell A. West and Lewis W. Edwards, Coatesville, Pa., assignors to Lukens Steel Company, Coatesville, Pa., a corporation of Pennsylvania

Application June 30, 1953, Serial No. 365,061
8 Claims. (Cl. 214—38)

1. Apparatus for lifting semi-trailers or the like and moving the trailers bodily sidewise onto a railway flatcar or the like comprising a body of substantial U-shape having a base portion and two arm portions whereby a trailer may be maintained within the confines of said body, a pair of lifting cylinder units on each arm for raising and lowering said body with respect to ground, said body having lifting forks for elevating and lowering the trailer, a jack-wheel unit on each arm forward of said cylinder units with respect to said base portion, said units having wheels, means to elevate and lower each of said units, means to drive the wheels of at least a pair of said lifting units and means to steer the wheels of the lifting units.

---



2,773,613

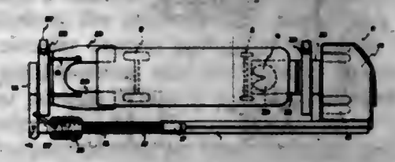
## TRACTOR SHOVEL

Robert E. Burrus, Buchanan, Mich., assignor to Clark Equipment Company, a corporation of Michigan

Application March 26, 1953, Serial No. 344,695
8 Claims. (Cl. 214—140)

1. For use with an industrial truck, the combination of a shovel having a lower leading edge, a shovel carriage on which the said shovel is pivotally mounted adjacent the said lower leading edge of the shovel, means for pivoting said shovel relative to said shovel carriage, arm means pivoted at one end to the truck and at the other end to said shovel carriage, first power actuated means carried by the truck and having connection with said arm means for effecting pivotal movement of the latter whereby said shovel carriage and shovel may be raised and lowered, second power actuated means carried by the truck, and linkage

means between said second power actuated means and said shovel carriage whereby upon actuation of said second power actuated means said shovel carriage and shovel may be tilted forwardly and rearwardly.



---

2,773,614

## APPARATUS FOR LOADING AND UNLOADING HEAVY EQUIPMENT

Lewis W. Edwards and Russell A. West, Coatesville, Pa., assignors to Lukens Steel Company, Coatesville, Pa., a corporation of Pennsylvania

Application January 18, 1954, Serial No. 404,404
10 Claims. (Cl. 214—390)

1. Apparatus for lifting semi-trailers or the like from the ground onto a platform such as the deck of a railway flatcar, comprising a frame mounted on wheels and adapted to be power driven over the ground, said frame having a front portion and a portion extending rearwardly therefrom in the form of a substantial L, said rearwardly extending portion consisting of first and second members connected in telescoping fashion, first housing portions foldably and pivotally mounted on said second member, second housing portions connected to the frame front portion, telescoping sections within one of said first and second housing portions, a ramp-like member pivoted to one of the sections in one of said first housing portions and a fifth-wheel unit adapted to be connected to the king pin of the trailer mounted integrally on one of the sections in one of said second housing portions, means including lifting means associated with the first and second housing portions for elevating the ramp member and fifth-wheel unit as well as the trailer when the unit is connected to the king pin and the trailer rear wheels are on the ramp member, means for actuating the lifting means, and means for causing telescoping action of the members of the rearwardly extending portion and the telescoping sections whereby, when the latter occurs, the ramp member and fifth-wheel unit are moved laterally of the frame.

---

2,773,615

## CARGO LOADING ATTACHMENT FOR FORK TRUCKS

John E. Conway, Mechanicsburg, Pa.

Application January 18, 1955, Serial No. 482,681
1 Claim. (Cl. 214—620)
(Granted under Title 35, U. S. Code (1952), sec. 266)

A cargo loading attachment for a fork-lift truck comprising a pair of elongated bars having telescopic engagement, said bars having a series of longitudinally spaced transverse openings adapted to register, a pin for engagement with a selected registering pair of said open-

ings for releasably locking said bars in the selected longitudinally adjusted position, a pair of rectangular sleeve elements secured to one side of one of said bars in spaced aligned relation near one end of the last named bar and adapted to receive one fork of the truck, an abutment

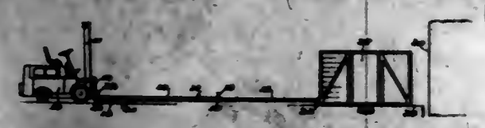


plate secured to the end of the last named bar adjacent said sleeve members for engagement with the lifting carriage of the truck, and a transverse pusher member secured to the end of the other bar which is remote from the bar having said sleeve members.

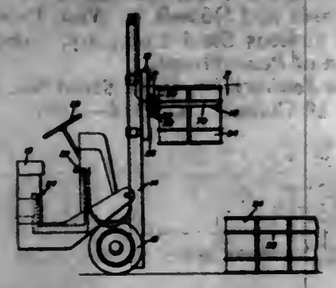
---



2,773,616

## DRUM CARRIER ATTACHMENT FOR LIFT TRUCKS

James J. Finnaren, Port Arthur, Tex., assignor of forty percent to Preston W. Ratley, Port Arthur, Tex.

Application May 12, 1954, Serial No. 429,254

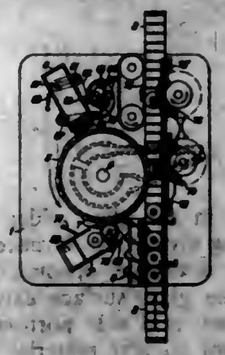
3 Claims. (Cl. 214—655)

1. A drum carrier for attachment to an industrial truck having a vertically hydraulically movable carriage provided with a horizontal crossbar, comprising a horizontally disposed plate secured to the crossbar, one forwardly projecting, elongated finger movably secured to said plate, another forwardly projecting, elongated finger movably secured to said plate for movement towards and away from the other finger, and means for actuation of said movable fingers for selectively clamping a drum between the fingers, said plate being provided with a first pair of forwardly projecting fingers, said fingers being slidably secured adjacent the side edges of the plate in horizontal alignment, a second pair of forwardly projecting fingers disposed intermediate the side edges of the plate, means for limiting the inward movement of the inner pairs of fingers, hydraulically controlled means for urging the outer fingers inwardly, said plate being provided with a horizontally disposed guideway having inturned side edges, each of said fingers having a mounting plate slidably received in said guideway, and arcuate contact plates at the inner ends of said fingers for engaging the peripheral wall of a plurality of drums, a double acting hydraulic cylinder and piston interconnecting the plate and the outer fingers, said intermediate fingers being normally spaced apart wherein a drum may be positioned between the inner fingers and between each inner finger and adjacent outer finger.

---

2,773,617

## HIGH-SPEED LABELING DEVICE



Johann Weiss, Berlin-Prohlsee, Germany

Application July 29, 1955, Serial No. 525,366

Claims priority, application Germany February 23, 1955

15 Claims. (Cl. 216—13)

1. A high-speed labeling device comprising a labeling drum having a plurality of suction areas, a vertical shaft for mounting said drum for continuous rotation, a source of vacuum for generating suction at said suction areas, and flexible tube connections associated with the source of vacuum for that purpose, a feed box for labels to be delivered to the suction areas of said drum in timed relationship with the rotation thereof, means for feeding workpieces to be labeled past said drum, and means for temporarily disconnecting said suction areas of said drum from the source of vacuum, said device further comprising a stationary duct concentrically arranged with the shaft of the labeling drum, means for connecting said

duct with said source of vacuum, an upper horizontal cover with a plane outer surface for said duct having openings distributed in rows along a circular ring, a second ring above said first ring and rigidly connected to said labeling drum, said second ring having a plane horizontal lower face forming a seal on said first ring while the rings rotate together, said second ring having perforations which are connected each with one suction area of said drum and past over successive openings in said cover.

---

2,773,618

## SERVICE INSTALLATION

Frank H. Mueller and Walter J. Bowan, Decatur, Ill., assignors to Mueller Co., Decatur, Ill., a corporation of Illinois

Original application January 10, 1950, Serial No. 137,768, now Patent No. 2,691,384, dated October 12, 1954. Divided and this application April 24, 1953, Serial No. 350,946

2 Claims. (Cl. 220—3.8)

2. In a stop cock box installation of the character described, a ferrous tubular liner having an exteriorly threaded upper end, a ferrous cover cap removably secured on said end and having a hub portion lined with a sleeve of non-ferrous metal, said sleeve having interior threads throughout a length greater than the length of the threaded portion of said liner and engaged with said threaded portion to secure said cap to said liner, said sleeve also having a skirt below its threaded portion extending below the threads on said liner and snugly engaging the latter below its threads to protect the latter, and a plug having at least its entire surface of non-ferrous metal threaded into the upper end of said sleeve and against the upper end of said liner.

2,773,619

## SEWER PLUG STOPPER

Axel Mueller, Racine, Wis., assignor to Mueller Manufacturing Co., Inc., Racine, Wis., a corporation

Application July 21, 1954, Serial No. 444,818

1 Claim. (Cl. 220—24.5)

An expansion stopper for sealing sewer drain bowls comprising a compressible resilient body having an annular side wall and a bottom wall provided with an axially disposed aperture, upper and lower compression plates fitted against the upper and lower surfaces of the body, an axially disposed threaded stem rigidly secured to the lower plate and extending toward the upper plate through the aperture in the bottom wall of the body, said upper plate having an axially disposed opening, an elongated nut threaded on the stem engaging the upper plate having an axially disposed depending sleeve extension extending through the opening in the upper plate for centering the nut and upper plate relative to one another and to prevent the stripping of the threads on the stem by the upper plate, a washer fitted on the stem against the upper surface of the bottom wall of the body and secured rigidly to the stem, whereby inadvertent displacement of the stem and lower plate from the body is prevented, and an annular tapered flange extending outwardly from the side wall of the body.

---

2,773,620

## CONTAINER AND CLOSURE THEREFOR

Andrew M. Toft, Chicago, Ill., assignor to National Can Corporation, Chicago, Ill., a corporation of Delaware

Application October 30, 1952, Serial No. 317,742

1 Claim. (Cl. 220—24.5)

A container comprising a body wall, an end secured to the body and comprising an annular member sealed at the periphery to the body and having an inwardly extending annular ring terminating in a seamless open neck extending inwardly of the body, a sealing closure for the neck comprising a first plate covering the neck opening and resting on the annular ring, a second plate, a gasket ring of compressible material between said plates and bearing against the inside of the neck and having a portion underlapping the same, said first and second plates having peripheral rims, said rims respectively extending upwardly from the top plate and downwardly from the bottom plate, the rim that projects from the top plate projecting an amount approximately the depth of the neck of said end and being opposite said neck and together with the neck forming a channel for receiving the gasket ring and confining the gasket ring against expansion radially, a portion of said first plate extending from the top of the peripheral rim thereof up to the neck where the neck merges with the rest of said end and constituting a closure for said channel and confining the gasket against axial movement, means on the outside of the plates for drawing the plates toward one another to compress the gasket means axially thereby forcing the portion of the gasket that is confined in the channel to expand radially in its confining channel into pressure engagement with the neck and with the depending rim of the first plate, said gasket extending below the neck whereby upon axial compression it expands also radially outwardly into sealing overlap at the bottom of the neck, said last means comprising a stud secured to the second plate at the center thereof and extending toward and through the first plate and a rotatable member operable on the stud to draw it axially to force the plates toward one another, and means for locking the rotatable member to prevent release of the sealing means.

## RESILIENT DISC CLOSURE

Charles Warren Harley, Gaithersburg, Md., assignor to the United States of America as represented by the Secretary of the Army

Application December 10, 1954, Serial No. 474,630

3 Claims. (Cl. 220—39)

1. In a screw threaded closure including a threaded closure body, a resilient sealing disc and actuating means for said closure; the improvement comprising said body having a circular central portion surrounded by an annular marginal portion, said disc having an annular resilient sealing portion disposed radially outwardly of said closure body, said actuating means being a rigid annulus, said annulus having an inner annular portion overlying said annular marginal portion of said body, an annular series of spot welds fixedly securing said inner annular portion of said annulus to said disc radially inwardly of said sealing portion, weld means fixedly securing said disc to said central portion of said body, and said annulus having an annular edge portion radially outwardly of said inner annular portion and in axially outwardly offset relation thereto and to said annular resilient sealing portion of said disc to permit axially outward flexing of the latter.

## RECLOSURE CONTAINER

Alf Trygve Angenens, San Mateo, Calif., assignor to American Can Company, New York, N. Y., a corporation of New Jersey

Application October 1, 1953, Serial No. 383,547

3 Claims. (Cl. 220—48)

3. A sealed cylindrical sheet metal container, comprising a tubular body having countersunk end members double seamed thereto in permanently secured end seams, said body having an integrally formed inwardly extending annular bead adjacent and spaced longitudinally from one of said closure members to constitute a cylindrical friction seat spaced radially inwardly from the plane of the body wall, and a cylindrical plug reclosure member having a surrounding upright laterally offset friction wall disposed in frictional engagement with

said annular bead seat to confine and protect the subjacent container contents, said reclosure member friction wall terminating at its outer end in a curled peripheral edge disposed in substantial contact with said seamed countersunk end closure member to hold the plug reclosure member in firm engagement with said bead seat, whereby after initial opening of the container by circumferentially cutting away the countersunk portion of said seamed end closure member adjacent to and radially outwardly of said plug closure member, the aforesaid curled wall edge of the latter may be manually grasped to facilitate its removal from and replacement on said annular body bead seat.

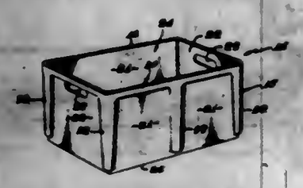
2,773,623

## CORROSION RESISTANT COATED STEEL MEMBERS AND METHOD OF MAKING

Ludwig Karl Schuster, Philadelphia, and Alfonso L. Baldi, Jr., Drexel Hill, Pa., assignors to Heintz Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania

Application June 1, 1954, Serial No. 433,698
12 Claims. (Cl. 220—64)

12. Plain carbon steel having its surface covered with an in situ formed adherent protective iron oxide surface film, the film being coated with an in situ formed combination of hydrated chromium oxides containing about 20 to 60% chromium by weight, about 40 to 95% of the chromium by weight being trivalent, the remainder being hexavalent, and the coating weighing about 10 to 200 milligrams per square foot of surface that it covers.



---

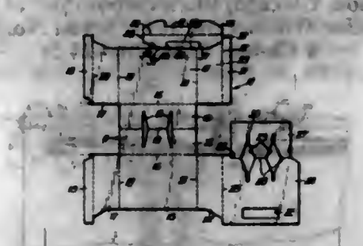
2,773,624

## PLASTIC CASE FOR TRANSPORTING PACKAGED FRESH MILK

Arlington W. Knierim, Pasadena, and Louis C. Foht, Los Angeles, Calif., assignors to Cahuzac Industries, Inc., Los Angeles, Calif., a corporation of California

Application September 20, 1954, Serial No. 457,008
3 Claims. (Cl. 220—97)

1. In an integrally molded plastic case, the combination of: a thin shell comprising a bottom, side walls and end walls, said side and end walls converging slightly from top to bottom to permit withdrawal of said case upwardly from the mold in which it is formed and to permit a lower end portion of said shell of one of said cases to fit within an upper end portion of the shell of another of said cases therebelow; a perimetric top reinforcing frame formed by outwardly thickening upper edge portions of said side and end walls; a perimetric bottom reinforcing frame formed by extending lower edge portions of said side and end walls several times the thickness of said bottom below said bottom and inwardly thickening said lower edge portions of said side and end walls several times the thickness of said side and end walls, said bottom reinforcing frame constituting a downward thickening of perimetric portions of said shell bottom several times the thickness of said bottom; and a series of downwardly tapering upright wall reinforcing elements formed by outwardly thickening said shell walls, said upright elements also constituting the downwardly tapering, downward thickening of said top reinforcing frame at spaced points about said case with the lower ends of said upright elements terminating short distances above the lower edges of said shell walls by at least partially overlapping with said perimetric bottom reinforcing frame, whereby said upright elements of one case rest on the top perimetric reinforcing frame of a case disposed therebelow in nesting relation therewith, said tapering upright reinforcing elements being located at the vertical corner edges of said shell whereby said elements reinforce said side and end walls at their lines of juncture and unite with said top and bottom perimetric reinforcing frames to form an integral skeleton of six rectangular frames, five of which are reinforced in the planes of said rectangular frames by said ends, sides and bottom of said shell.



---

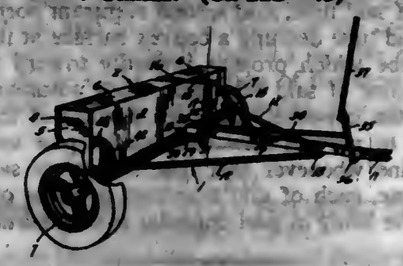
## ARTICLE CARRIER

Edwin L. Arneson, Morris, Ill., assignor, by mesne assignments, to Federal Paper Board Company, Inc., Bogota, N. J., a corporation of New York

Application June 18, 1953, Serial No. 362,622
2 Claims. (Cl. 220—113)

1. A paperboard article carrier comprising upstanding side and end walls and a bottom extending between bottom margins of the side walls, a central longitudinal partition hinged to the end walls and paralleling the side walls, said longitudinal partition extending substantially the full length of the carrier and comprising an upstanding partition panel and a flap section of substantial area integrally hinged by a horizontal crease to a lower margin thereof, said partition panel and flap section being provided with longitudinally spaced vertical slots opening downwardly through said hinging crease and said bottom having longitudinally spaced transverse slots extending at a right angle to the longitudinal partition and in vertical alignment with the slots of the latter, and a U-shaped transverse divider having its parallel arms received in the slots in said bottom and longitudinal partition in upstanding straddling relation to said longitudinal partition, said arms having upwardly opening slots for interlocking with the slotted partition panel and flap and extending upwardly past the ends of the slots in said partition panel and flap section, said divider arms engaging opposite side faces of said partition panel and flap section, and said divider being fabricated of thicker material than said partition panel and flap section so as to approximate the combined width of the latter.



2,773,626

## SPREADER FOR FERTILIZER, SEEDS AND THE LIKE AND FEED RATE CONTROL THEREFOR

Everhard S. Gemstad, Owatonna, Minn.

Application March 2, 1953, Serial No. 491,641
7 Claims. (Cl. 222—43)

1. In a device for spreading granular material, an elongated wheel-mounted mobile hopper having a plurality of longitudinally spaced discharge openings in its bottom portion, a valve-acting gate plate underlying said hopper bottom portion and having discharge openings registrable with the discharge openings of the hopper bottom to a variable extent under longitudinal sliding movements of the gate plate with respect to the hopper, means mounting and guiding said gate plate for longitudinal sliding movements with respect to the hopper bottom to variably open and close said discharge openings, said gate plate having a stop element at one end which is disposed in closely spaced relation to the adjacent end of the hopper when said gate plate is moved longitudinally to a position to close the hopper bottom discharge openings, a control arm pivotally mounted adjacent its inner end to the hopper at a point between the vertical plane of the end of said hopper and the vertical plane of the adjacent end of said stop element, means limiting pivotal movements of said control arm between a generally vertical position wherein it is disposed close to and substantially parallel to the adjacent end of the hopper and another extreme position where it is directed inwardly of the end of the hopper and angularly disposed with respect to said generally vertical position, means for locking the control arm in different angularly disposed positions, a graduated arcuate scale associated with the upper end portion of the control arm and having one end disposed adjacent the said end of the hopper and extending inwardly and downwardly therefrom, and a laterally inwardly offset abutment element carried by the control arm adjacent the pivot thereof and having an operating face portion facing and disposed in the field of longitudinal movement of said stop element and defining a curve generally eccentric to the axis of pivotal movement of the control arm, whereby to adjustably limit the outward sliding movements of the gate plate and the resultant discharge rate through the cooperating discharge openings of the hopper and gate plate under different positions of the control arm.

---

2,773,627

## CLAMPING DEVICE FOR CLOSING A FLUID OR PASTE CONTAINER

Lennart Viktor Samuel Lundahl, Motala, Sweden

Application October 31, 1955, Serial No. 543,786
14 Claims. (Cl. 222—107)

1. A manually-operable self-closing clamping device for closing a collapsible mouth of a flexible-walled container, comprising a substantially rigid frame having a through passage for receiving said container at the region of its mouth with the latter open, said frame having a clamping surface adapted to engage one side of the container mouth; a double-branched resilient clamping member having elongate branches connected by a yoke portion, said branches extending alongside each other; means engaging an end of one branch of said clamping member, mounting the latter on the frame, the two branches of said member extending substantially parallel to the through passage of the frame, the other branch of the clamping member extending beyond the extremity of the one branch, curving toward and extending to the clamping surface of the frame, said branches of the clamping member being biased toward each other whereby the curved portion of the said other branch is biased toward said frame clamping surface to collapse the mouth of the container thereagainst and seal the same; and opening cam means cooperable with said other branch of the clamping member to force the curved portion thereof away from the frame clamping surface in response to lateral movement of the yoke portion of the clamping member.

---

2,773,628

## CONDIMENT DISPENSERS

Robert J. Gabler, New York, N. Y.

Application August 16, 1952, Serial No. 304,782
6 Claims. (Cl. 222—142.1)

1. A condiment dispenser comprising a container partitioned to provide separate condiment receiving chambers, closures threadably mounted on the opposite ends of said container and provided with centrally disposed outlet passages, disks seated on the ends of said container and secured thereon by said closures and formed with centrally disposed apertures aligned with the apertures in said closures, inwardly extending discharge tubes carried by said disks, and inverted cone-shaped caps supported by the inner ends of said discharge tubes and in concentric relation thereto.

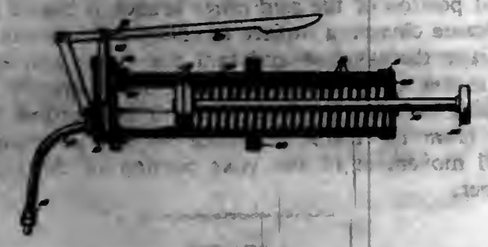
---

2,773,629

## FUEL FEEDER

Earle C. Miller, Worcester, Mass., assignor to Riley Stoker Corporation, Worcester, Mass., a corporation of Massachusetts

Application November 3, 1953, Serial No. 390,030
3 Claims. (Cl. 222—226)



1. A fuel feeder for supplying moist, bulky refuse to a furnace comprising a hopper having at least one inclined

side, an endless belt providing an inclined downwardly-moving surface in opposition to the said inclined side, the moving surface and the said wall diverging in a downward direction, a screw type conveyor underlying the hopper and a downwardly directed chute having its upper end underlying the discharge end of the screw type conveyor.

---

2,773,630
GREASE GUN
Floyd J. Mascher, Dieterich, Donald Kissinger, Effingham, and Arthur Clegg, Dieterich, Ill.
Application October 16, 1953, Serial No. 386,471
1 Claim. (Cl. 222—256)

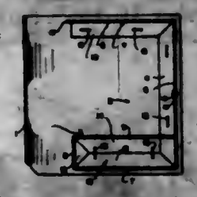
A portable grease gun comprising: a one-piece cylindrical barrel of transparent plastic material which renders its contents visible, and having open ends, heads of metal removably connected by screw-threads to the inner and outer ends of the barrel, respectively, one of said heads having means for the discharge of grease from the barrel, a piston slidable in the barrel, a spring in the barrel for urging the piston to discharge the grease, and a single solid annular band integral with and of the same plastic material, adjacent the longitudinal center of the barrel, and of sufficient thickness to longitudinally and transversely reinforce the barrel at its longitudinal center against deformation, the band having substantially right angled sides fitting between contiguous fingers of the hand of a user for grasping the gun against slippage in said hand while it is being manually manipulated.

---

2,773,631
MEASURING AND DISPENSING DEVICES FOR CONTAINERS
Paul M. Bryant, Akron, Ohio
Application January 16, 1952, Serial No. 266,671
18 Claims. (Cl. 222—450)

5. A measuring and dispensing device for containers that can be associated with a container to selectively permit or prevent the flow of material from said container and that comprises a tube of flexible material, an opening at one end of said tube, a closure at the other end of said tube, a normally closed aperture in said tube, a bending line intermediate the ends of said tube, a second bending line intermediate the ends of said tube, said bending lines being spaced apart longitudinally of said tube, said tube being bendable about the first said bending line to entrap a predetermined quantity of material between said closure and the first said bending line, said tube being bendable about said second bending line to entrap a larger predetermined quantity of material between said closure and said second bending line, said aperture being openable to release said entrapped material, the first said bending line being defined by a reentrant portion of the wall of said tube, said reentrant portion of the wall of said tube defining a convex surface at the interior of said tube which projects inwardly toward the longitudinal center of said tube and which automatically approaches the oppositely disposed portion of the wall of said tube to prevent flow of material past the first said bending line whenever said tube is bent at the first said bending line, said second bending line being defined by a second reentrant portion of the wall of said tube, said second reentrant portion of the wall of said tube defining a convex surface at the interior of said tube which projects inwardly toward the longitudinal center of said tube and which automatically approaches the oppositely disposed portion of the wall of said tube to prevent flow of material past said second bending line whenever said tube is bent at said second bending line, each of said reentrant portions of the wall of said tube being in part conoidal in configuration.

---

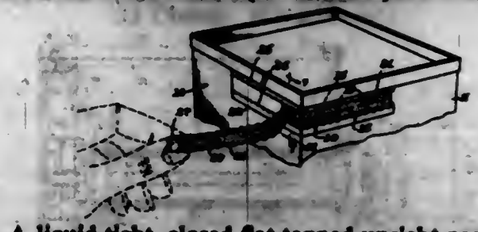


2,773,632
NOZZLE CONTAINER WITH FLEXIBLE TELESCOPING POURING SPOUT
Walter J. Dobbins III, Little Falls, N. J., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application June 5, 1953, Serial No. 359,754
4 Claims. (Cl. 222—525)

3. A container having a nozzle provided with a circular dispensing mouth surrounded by a sealing seat for a gasketless closure cap, said seat terminating in an annular depending skirt defining said mouth, and a telescoping tubular pouring spout of resilient compressible plastic material slidable within said mouth, said spout having an annular resilient flange overlapping said sealing seat to constitute a gasket for said closure cap for sealing said mouth when said spout is in a retracted position within said nozzle with said closure cap applied to said nozzle, the inner end portion of said spout having an enlarged integral cylindrical head of slightly greater diameter than the diameter of said nozzle mouth, said head tapering inwardly toward the inner spout end having a diameter slightly less than that of said mouth to facilitate yieldable insertion of said spout end portion through said mouth to assemble the spout on the nozzle, said enlarged cylindrical head terminating at its outer end in a stop shoulder engageable with said nozzle spout to prevent inadvertent withdrawal of the inserted spout from said nozzle.

---

2,773,633
CONTAINERS
Elmer Haskell, Forest Hills, N. Y.
Application October 20, 1953, Serial No. 387,289
7 Claims. (Cl. 229—8)



1. A container resembling and opening like a book, comprising a sheet of corrugated cardboard folded upon spaced transverse lines about midway of its length, into a U-shape to represent the covers and bound edge wall of a book, a strip of corrugated cardboard extending along but spaced slightly from the marginal edge of the inside face of that part of the sheet representing the back cover, between the ends of the bound edge wall portions, said strip having bent over flanges along its side edge which abuts said inside face, lying along said inside face and attached thereto, the width of said strip, as it upstands from said inside face being approximately equal to the distance from arm to arm of the U of the covers, and a fastening device releaseably coupling the free edge, at the outer end of the U, of the portion of the sheet representing the front cover to the upstanding wall of said strip.

---

2,773,634
PAPERBOARD CARTON POURING SPOUT CONSTRUCTION
Kalil Nogues, Rockford, Ill., assignor to Dairy Containers, Inc., Rockford, Ill., a corporation of Illinois
Application March 12, 1953, Serial No. 341,860
9 Claims. (Cl. 229—51)

1. A liquid-tight, closed flat-topped upright paperboard carton the body of which is made of paperboard material coated inside and out with thermoplastic material, said carton having flat side walls defining corner portions and having in the side of one upper corner portion thereof a substantially continuous horizontal slit that extends both ways from the corner, the corner portion below said slit adapted to define a V-shaped pouring spout when the corner portion above said slit is bent upwardly folding the flat top along a line diagonally of the corner and thereby opening said slit, and adhesive strips coated with thermoplastic material adapted to bond with the coating on the carton under heat and pressure, said strips being applied under heat and pressure to the inner and outer sides of said carton covering said slit and sealing the same while at the same time preventing upward bending of said corner portion, the outer strip having longitudinally extending weakening lines above and below the slit defining therebetween a tear portion overlying the slit, removal of which preliminary to opening the slit uncovers the slit and weakens the structure facilitating the opening up of the slit, the inner strip adapted to tear lengthwise when the corner portion above said slit is forcibly bent upwardly to open the slit.

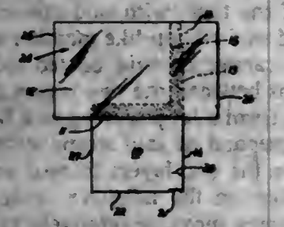
2,773,635
PACKAGE CARRIERS AND METHOD FOR MAKING THE SAME
William Scalmer, Summit, N. J.
Application October 30, 1952, Serial No. 317,728
7 Claims. (Cl. 229—52)

1. A package carrier comprising a tape having a coating of adhesive on one side thereof, the other side having no coating of adhesive, a longitudinal central slit provided in the middle portion of said tape, openings in said tape at the terminations of said slit, and a ribbon-like member linearly coextensive with said tape and positioned centrally relative to the lateral edges of said tape, said ribbon-like member at its end portions being positioned on the adhesive coated side of said tape and passing through said openings so that the intermediate portion of said ribbon-like member for the length of said slit is positioned on the side of said tape that is not coated with adhesive, said end portions in contact with said adhesive side of said tape being bonded thereto, said tape having transverse fold lines at said openings and at equal distances from said openings, the adjacent equal portions being folded on transverse lines and bonded together where coated sides are against each other to form a pair of straps of two layer thickness spaced apart longitudinally of the tape, with said openings at the ends of said straps and said ribbon-like member extending from one end of said carrier on said coated side through the first of said straps between the two layers thereof, emerging therefrom to form a loop serving as a handle reaching to the tip of the second of said straps, extending through the latter between the two layers thereof and to the other end of said device on the adhesive coated side of said tape said straps being movable relatively to the remainder of the tape, whereby the tension of said loop is transmitted through said straps to the remainder of the carrier.

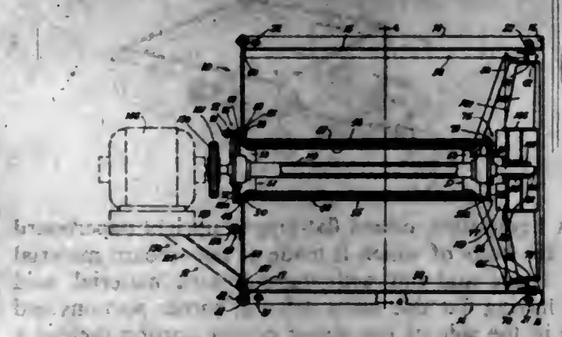


---

2,773,636
PAPER OR LIKE CONTAINERS AND THEIR MANUFACTURE
Russell J. Williams, Richmond Heights, and Charles V. Brady, St. Louis, Mo., assignors to Bemis Bro. Bag Company, St. Louis, Mo., a corporation of Missouri
Application August 11, 1952, Serial No. 303,772
5 Claims. (Cl. 229—55)

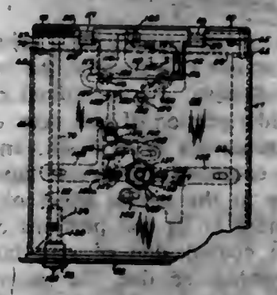
1. A flat gusseted bag adapted when opened to assume a carton-like form, said bag being formed from a generally rectangular blank having a relatively stiff intermediate band comprising a sheet of relatively stiff material such as cardboard and relatively flexible outer bands of material such as paper, said bands extending continuously from one side edge of the blank to the other, at least one of said outer bands being provided by a sheet of material such as paper which covers the outside of the intermediate band and which has a portion extending outward from one margin of the intermediate band and a portion doubled back upon said outwardly extending portion on the inside thereof, said doubled-back portion having its inner margin lapping and adhered to said one margin of the intermediate band, the blank being folded to have its said side edges overlapping, and said side edges being adhered together all along the overlap, including the overlapping portions of the side edges in the relatively stiff intermediate band and the overlapping portions of the side edges in the relatively flexible outer bands, thereby providing a tube having a relatively stiff intermediate section and relatively flexible end sections, the tube having scores extending continuously from one of its ends to the other establishing gusset sides and front and back walls, the tube being flat when the gusset sides are infolded, one end section being folded and pasted to provide a bottom closure adapted to lie flat with the flat tube and being sufficiently flexible to assume the form of a substantially flat bottom closure in a plane normal to the front and back walls when the gusset sides are angled out into substantially flat planes normal to the front and back walls, the other end section providing a flexible top for the tube which lies flat with the flat tube and which is sufficiently flexible to be closed and to assume the form of a substantially flat top closure when the sides are angled out into said flat planes and the container has been filled.

2,773,637
BACON TRAY
Reynolds Guyer, St. Paul, Minn., assignor to Waldorf Paper Products Company, St. Paul, Minn., a corporation of Minnesota
Application October 15, 1951, Serial No. 251,284
2 Claims. (Cl. 229—87)



1. A package including a generally rectangular panel, a second panel integral with and foldably connected to the first panel along a fold line coextensive with an edge, said second panel being substantially within the confines of said first panel when folded thereon and including a panel portion extending along the said fold line and an integral narrow right angularly extending portion at one end of the first named panel portion and extending in substantial alignment with an edge of said first panel at right angles to said fold line, said two panel portions leaving the major portion of said first panel exposed when folded thereupon, and an integral flap foldably connected to the end of said second panel portion of said second panel designed to fold over the edge of the first panel parallel to said fold line and to underlie said first panel, an integral transparent liner sheet of rectangular form overlying and adhered to said second panel along both portions thereof, said liner sheet extending substantially beyond the side edges of said second panel, and extending over at least a portion of said flap, but being free of attachment therewith.

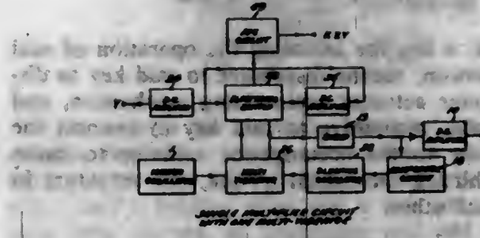
2,773,638
MAILING ARTICLE
Henry R. Krohn, Cleveland, Ohio
Application November 28, 1947, Serial No. 788,428
3 Claims. (Cl. 229—92)



1. A two way mailing article comprising a single sheet of foldable stationery material including an inner section, a first outer section extending from one edge of the inner section and a second outer section extending from the opposite edge of the inner section, the first outer section bearing, on one side of said sheet, main address indicia of a sender of the mailing article and being foldable onto the inner section, the second outer section bearing, on the same side of said sheet as that mentioned above, main recipient's address indicia and being foldable toward the inner section to lie over the first outer section for exposing the recipient's main address indicia and concealing the sender's main address indicia, means to retain the parts folded as above described with the recipient's address exposed and the sender's address concealed for mailing the mailing article to a recipient, said second outer section having end cut-out sealing areas, and sealing means comprising an adhesive applied to the first outer section at its ends and adapted to have direct sealing connection with the inner section through said cut-out areas when the second outer section is folded onto the inner section and the first outer section is folded to lie over the second outer section for exposing the sender's main address indicia and concealing the recipient's main address indicia for mailing the mailing article to the sender, and sealing means comprising an adhesive extending along the free edge of the first outer section contiguous with the adhesive applied at the ends of said first outer section and adapted to have sealing connection with the second outer section adjacent the fold edge of the latter when the parts are folded as last mentioned to expose the sender's main address indicia.

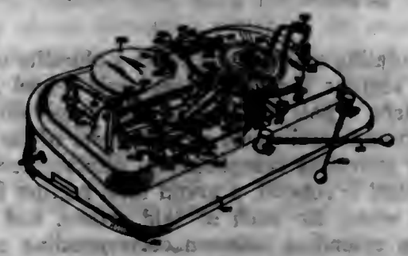
2,773,639
DRAFT INDUCERS
Harry S. Wheller, Elizabeth, N. J., assignor to L. J. Wing Mfg. Co., Linden, N. J., a corporation of New Jersey
Application September 1, 1953, Serial No. 377,857
28 Claims. (Cl. 230—117)

1. A draft inducer comprising a casing, said casing comprising top, bottom and side panels, at least one of said panels having a flue gas inlet opening therein, means to detachably attach the adjacent corners of the panels to form a casing of rectangular cross section, a front wall, means to detachably attach said front wall to the front end of the casing, and insulating tube axially attached to the front wall and projecting therefrom into the casing, diagonal struts attached to the rear end of the insulating tube, parallel corner members attached at their rear ends to the struts and at their front ends to the front plate and constituting runners contacting the corners of the casing formed by said panels, a fan shroud fixed to the forward ends of said parallel members, spiders at the front and rear ends of said insulating tube, bearings supported by said spiders, a shaft passing through said insulating tube and bearings, and a fan at one end of said shaft and located within the fan shroud to remove flue gases through the rear end of the casing.

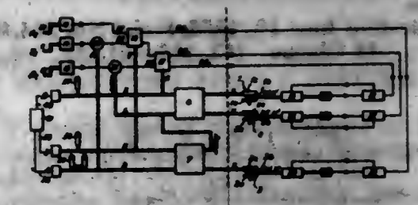


2,773,640
FARE BOX
Albert S. Wheelberger, Dayton, and Edward C. Warrick, West Liberty, Ohio, assignors to Rockwell Register Corporation, Bellefontaine, Ohio, a corporation of New York
Application April 18, 1952, Serial No. 283,084
18 Claims. (Cl. 232—16)

1. In combination, a walled safe having a first opening in one wall for the insertion of a drawer, and a second opening in a second wall; a totally enclosed drawer insertable into said safe through said first opening, and having a hinged top wall; a lock operable to hold said hinged top wall closed, and said hinged top wall having an opening in alignment with said second opening in the second wall of said safe when said drawer is fully inserted into said safe; a hinged trap door operable to close said opening in said drawer top wall; a latch in said drawer top wall operable to hold said trap door closed; said lock being operable to first release said trap door latch and then release said drawer top wall.

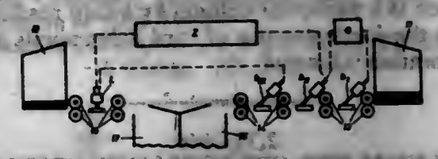


2,773,641
ELECTRONIC MULTIPLIER
Richard V. Beum, Akron, Ohio, assignor to Goodyear Aircraft Corporation, Akron, Ohio, a corporation of Delaware
Application January 26, 1951, Serial No. 207,986
12 Claims. (Cl. 235—61)



12. In an electronic multiplier for producing an output signal proportional to the product of two variable input signals, means for reversing the polarity of one of the input signals, averaging circuit means, switching means for alternately passing said one input signal and the output of the reversing means to the averaging circuit means, and timing means operatively connected with the switching means for reversing said switching means at intervals of time which are a function of the other of the input signals.

2,773,642
INTEGRATOR
John B. McGay and Harold E. Spore, Tulsa, Okla., assignors to Rockwell Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application April 17, 1953, Serial No. 349,488
34 Claims. (Cl. 235—61)



4. In a calculating machine for integrating a curve on a chart; supporting means for a chart to be integrated; means for driving said supporting means, means forming a plurality of sets of pen arm centers; a plurality of sets of pen arms constructed to be selectively mounted upon said sets of pen arm centers for tracing static pressure and differential pressure record traces on a chart on said supporting means; a plurality of differential pressure cams shaped in accordance with differential pressure ranges; a first adjustable cam follower selectively positionable to engage any one of the differential pressure cams of said set; a plurality of static pressure cams shaped in accordance with static pressure ranges; a second adjustable cam follower selectively positionable to engage any one of said static pressure cams; means operable to actuate said cam followers in accordance with the positions of any of said sets of pen arms and flexible tape drive means connecting all of said pen arm centers to position them concomitantly in accordance with the positions of said cam followers on said cams, and including resilient means operable to maintain tension in said tape.

2,773,643
DEVICES FOR FOLLOWING A MOVABLE OBJECT
Torbern Telling, Lidingo, Sweden, assignor to Arenco Aktiebolag, Stockholm, Sweden, a Swedish joint-stock company
Application September 29, 1951, Serial No. 248,130
Claims priority, application Sweden September 29, 1950
5 Claims. (Cl. 235—61.5)

1. In a device for tracking a movable target, in combination, a plurality of sighting means adapted to continually follow the target and indicate the polar coordinates of said target, automatically operative speed integrators, error correcting members for producing correcting quantities, primary and secondary coordinate transformers, and automatically adjustable devices, said speed integrators being operable by said error correcting members and adapted to integrate components of speed in a stationary right angled system of coordinates and connected to said secondary coordinate transformers for converting the integrated components into polar coordinate quantities which control said sighting means, manually controllable tracking means individual to each of said primary coordinate transformers and adjustable to positions which are calculated from said correcting quantities values that are proportional to the projections of said correcting quantities in said right angled system of coordinates and means for transferring said values to said automatically adjustable devices for producing said components of speed and supplying them to said speed integrators.

2,773,644
RECORD CARD CONTROLLED MACHINES HAVING GROUP CONTROL MECHANISM
Michael Mani, Schwabach, near Nurnberg, Germany
Application September 1, 1953, Serial No. 377,822
Claims priority, application Germany September 5, 1952
7 Claims. (Cl. 235—61.7)

5. In a record card controlled machine, means for feeding record cards along a feeding path, analyzing means on said feeding path for analyzing amount data fields of said record cards, accumulating means under the control of said amount data analyzing means, a group control mechanism including analyzing means in said feeding path and responsive upon a group change in the designation data of subsequent cards, recording means automatically set under the control of said accumulating means by said group control mechanism upon a group change for recording the setting of said accumulating means, further designation data analyzing means arranged in said feeding path behind said amount data and designation data analyzing means to control said

recording means, feed control means controlled by said group control mechanism for interrupting upon group change the card feed past said amount data and group control analyzing means and to feed the last card of the group to said further designation data analyzing means, and means for controlling the recording means by said further designation data analyzing means concurrently with the control of said recording means by said accumulating means.

2,773,645

## CARD CONTROLLED COMMUTATOR

Herman A. Spoh, East Williston, N. Y., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan

Application June 10, 1955, Serial No. 514,460
13 Claims. (Cl. 235—61.11)

10. In a business machine adapted to utilize record cards, the combination of card reading brushes positioned to cooperate with columns of index points on record cards for sensing perforations in the record cards, card feeding means associated with said card reading brushes, a plurality of commutator brushes disposed in a sequential arrangement in the direction of card travel beyond said card reading brushes, the distance of each commutator brush from said card reading means being equal to the distance of respective rows of card index points from the forward edge of each individual record card, an electrical potential source against which said commutator brushes bear in the absence of a record card, said commutator brushes and said electrical potential source being adapted to have record cards fed between them so that said commutator brushes are insulated from said electrical potential source causing the potential on each of said commutator brushes to be changed, and a plurality of pulse generators each connected to and controlled by a respective commutator brush for generating a pulse in response to the change of potential caused on the respective commutator brush by the passage of the forward edge of each record card, whereby the particular pulse generator which generates a pulse simultaneously with the sensing of a perforation in a particular column by a card reading brush manifests the particular row of card index points in which said perforation is located.

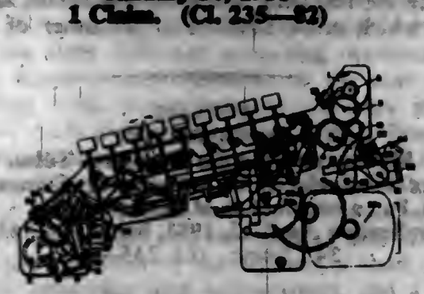
## MECHANISM FOR CONTROLLING ACCUMULATIONS AROUND A FIXED DECIMAL AND FOR ADJUSTING A COUNTER ACTUATOR IN SELECTED ORDINAL RELATION TO AN ACCUMULATOR ACTUATOR

Walter E. Medfil, Oakland, Calif., assignor to Marchant Calculators, Inc., a corporation of California

Application March 7, 1952, Serial No. 275,251
6 Claims. (Cl. 235—43)

3. In a calculating machine having, an accumulator register composed of a line of ordinal numeral wheels, a plural order actuator therefor mounted for ordinal shifting movement relative to said register, a counter register composed of a line of ordinal numeral wheels parallel to the line of accumulator numeral wheels, and a single order actuator mounted for ordinal shifting movement relative to the counter register; the combination of manually adjustable means for locating the counter actuator in any one of a plurality of ordinal positions in which it is operable to actuate a corresponding numeral wheel, and means to maintain the counter actuator in said located position, with shifting mechanism for causing ordinal step-by-step shifting movement of said plural

order actuator, a key for initiating the operation of said shifting mechanism, means responsive to said key to disable said counter actuator maintaining mechanism, and other means also responsive to said key to connect the counter actuator to the accumulator actuator to cause step-by-step shifting movement of the two actuators in unison with each other.



---

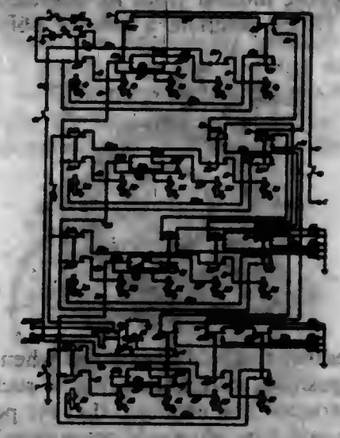
2,773,647

## GRAND TOTAL ACCUMULATING MECHANISM

Christopher Frederick Webb, London, England, assignor to Bell Punch Company Limited, London, England, a British company

Application December 22, 1951, Serial No. 262,953
Claims priority, application Great Britain January 30, 1951
1 Claim. (Cl. 235—62)

In a calculating machine including a plurality of orders, a primary register including a numeral wheel for each of said orders, a pair of rotatable cams operatively connected to the numeral wheel of each order of the primary register for providing complemental displacements as the numeral wheel is rotated, a grand total register including a numeral wheel for each of said orders, and transfer mechanisms extending between corresponding orders of said primary and grand total registers, said transfer mechanisms each including a cam follower, means for selectively positioning said cam follower adjacent to one or the other of the cams of its order, said cam follower being normally out of engagement with its adjacent cam, means for bringing said cam follower into engagement with its adjacent cam thereby selectively displacing said follower directly for addition or complementally for subtraction relative to the position of the primary register numeral wheel depending upon which of the cams is engaged by the follower, and means responsive to the position of said follower for transferring to the grand total register numeral wheel a numeral relative to the numeral displayed by the primary register numeral wheel, the cam follower of the lowest order being provided with a stepped cam engaging surface to provide an extra digit during the process of subtraction.



2,773,648

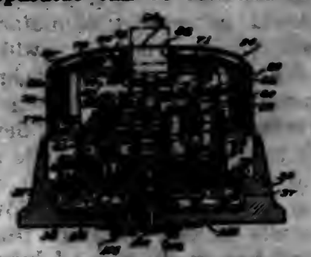
## BINARY-DECIMAL COUNTER

John B. Cannon, Jr., State College, Pa., assignor, by mesne assignments, to Research Corporation, New York, N. Y., a corporation of New York

Application April 5, 1952, Serial No. 280,795
23 Claims. (Cl. 235—92)

1. A counter for counting electrical impulses in an impulse receiving circuit, comprising a plurality of interconnected electrical relays including a pair of impulse relays and a holding relay and a pair of control relays, each relay having an energizing coil and at least one switch that occupies a released position when the coil is deenergized and an energized position when the coil is energized, a control circuit, the coil of the holding relay being initially connected in the control circuit through a switch of the first impulse relay in its released position and through a switch in series therewith of the second impulse relay in its energized position and thereafter remaining connected in the control circuit in holding circuit relation through its own switch in its energized position and through a switch in series therewith of the first impulse relay in its released position, the coil of the first control relay being connected in the control circuit through a switch of the second impulse relay in its released position and through a switch in series therewith of the holding relay in its energized position, the coil of the second control relay being connected in the control circuit through series connected switches of the first impulse relay and the first control relay in their released positions, the coil of the first impulse relay being connected in the impulse receiving circuit through a switch of the second control relay in its released position, and the coil of the second impulse relay being connected in the impulse receiving circuit through a switch of the first impulse relay in its released position, whereby the impulse relays will be energized alternately in cyclic sequence completing one cycle upon the occurrence of every alternate electrical impulse in the impulse receiving circuit.

---



2,773,649

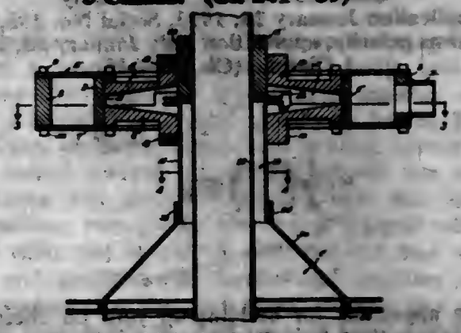
## CIRCUIT-CONTROLLING DEVICE

Adolph J. Hilgert, Milwaukee, Wis., assignor to Milwaukee Gas Specialty Company, Milwaukee, Wis., a corporation of Wisconsin

Application February 19, 1954, Serial No. 411,396
21 Claims. (Cl. 236—21)

2. In a condition controlling apparatus having electromagnetic control means and electrical circuit means therefor: A cycling condition responsive circuit-controlling device in said circuit means for controlling said electromagnetic control means and hence said apparatus in response to fluctuations in the condition; a resettable condition responsive circuit-controlling device in said circuit means for overcalling said cycling circuit-controlling device and taking over the control of said apparatus in response to a predetermined condition, said resettable circuit-controlling device requiring resetting before control of said apparatus can be returned to said cycling

circuit-controlling device; and common condition sensing means for both of said circuit-controlling devices.



---

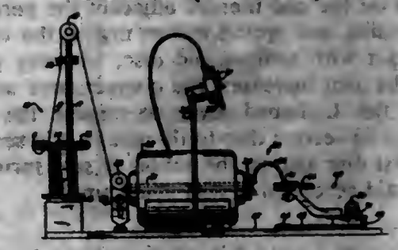
2,773,650

## METHOD AND APPARATUS FOR PROCESSING AND COLLECTING FINELY DIVIDED MATERIAL

William T. Doyle, Boston, Mass., assignor to Sturtevant Mill Company, Dorchester, Mass., a corporation of Massachusetts

Application June 3, 1953, Serial No. 359,363
5 Claims. (Cl. 241—39)

1. A grinding machine including enclosure means for receiving a confined stream of fluid material, means for feeding particles into the enclosure means, a device for selectively separating and discharging particles from the chamber, said device including a tubular member axially disposed in the enclosure means, and a conduit element arranged concentrically with respect to the tubular member to define an annular duct, said device further including two radially disposed flanges supported around the said tubular member and adjustable toward and away from one another to control the size of particles passing through said annular duct.



---

2,773,651

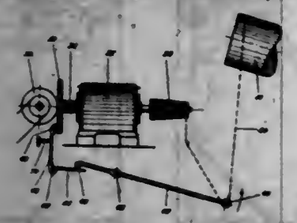
## COIL WINDING APPARATUS

Richard R. Whipple, Haverhill, Mass., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Application November 13, 1952, Serial No. 320,191
1 Claim. (Cl. 242—4)

An apparatus for winding turns of a strand on an arcuate segment of a toroidal core comprising means mounted for movement about an axis, an arm secured to said means and extending above said means and substantially toward the axis, clamping means on said arm for receiving and removably gripping one end of an arcuate segment of a toroidal core and for holding the arcuate core segment with its center of curvature in alignment with

the axis while successive cross-sectional portions of the segment are moved into a winding position to receive turns of the strand, an energizable motor having a hollow shaft, means to support the motor with the axis of its hollow shaft disposed in a plane at right angles to the axis of said movable means and in alignment with the center of each cross-sectional portion of the segment when in the winding position, means to guide a strand to an entrance end of the hollow motor shaft, a semi-circular flyer secured to the exit end of the hollow motor shaft, positioned laterally in one direction from the hollow motor shaft, and having an external groove therein for receiving the strand from the hollow motor shaft and discharging it in the plane of each cross-sectional portion of the core segment when in the winding position, and an adjustable weight carried by the exit end of the hollow motor shaft and positioned substantially diametrically opposite the flyer to counterbalance it.



---

2,773,652

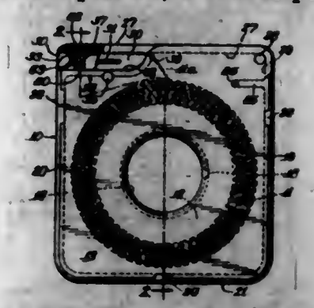
## APPARATUS FOR THE PRODUCTION OF YARN CHEESES

Goffredo Severini, Milan, Italy

Application January 26, 1953, Serial No. 333,166
Claims priority, application Italy January 25, 1952
1 Claim. (Cl. 242—45)

In an apparatus for building-up yarn on cheeses carried by a spindle driven from a source of power, the yarn being delivered at a constant speed and the spindle being driven at a speed greater than the speed of delivery of the yarn, the combination of a drive connecting the source of power and the cheese spindle, said drive comprising a first disc rotated by the source of power adjacent the end of the spindle opposite the cheese, a second disc slidably mounted on said end of the spindle perpendicular to said first disc, spring means urging the surface of said second disc into engagement with the periphery of the first disc to form a friction drive connection between the discs, compensator means between the delivery of the yarn and the cheese, said means comprising an arm pivoted to the apparatus, a roller on the end thereof over which the yarn passes to the cheese, and means contacted by the compensator means to disconnect the drive and brake the spindle, said means comprising an L-shaped lever pivoted at the elbow thereof to the apparatus, one arm of which is in contact with the free end of said compensator arm, the other arm of which has slippage means on the end thereof adjacent the periphery of said second disc, and spring means urging the other arm out of contact with said second disc, whereby when the tension in the arm increases, the compensator arm pivots and pivots the L-shaped lever to engage the slippage means with said second disc to disengage said second disc from said first disc against the action of said spring means and brake said second disc and said spindle.

---



2,773,653

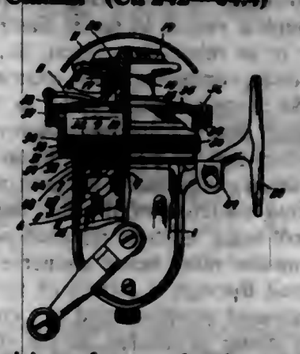
## TAPE DISPENSER

George W. Emmert, Winnetka, Ill., assignor, by mesne assignments, to Federal Tool Corporation, Chicago, Ill., a corporation of Illinois

Application May 5, 1953, Serial No. 353,170
12 Claims. (Cl. 242—55.5)

1. A tape dispenser comprising, a casing for enclosing a roll of tape, means within said casing for rotatably supporting said roll, said casing having a slot thereon and an opening through which said tape may be withdrawn in a path over said slot, a cover member on said casing movable between open and closed positions and having a predetermined intermediate position adjacent said closed position, means requiring said cover member to be moved in quick snapping motion from its intermediate position into its said closed position, a row of pointed teeth on

said cover member received by said slot when said cover is in its closed position, said teeth being of such length and being so constructed and arranged that the points thereon will perforate said tape when said cover member is moved in said snapping motion from its intermediate position into said closed position, and means including diagonally disposed cutting surfaces on the lateral edges of said teeth for severing said tape between the perforations therein during said snapping motion.



---

2,773,654

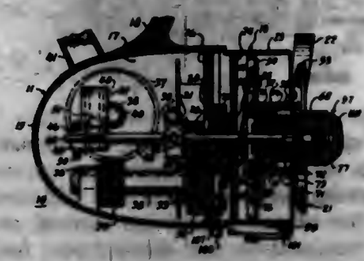
## SPINNING TYPE FISHING REEL

Franz Karl Hübner, Malmo, Sweden, assignor to Victory Produkter Aktiebolag, Malmo, Sweden, a corporation of Sweden

Application September 20, 1955, Serial No. 535,325
Claims priority, application Sweden September 21, 1954
8 Claims. (Cl. 242—84.4)

1. A reel comprising a frame, a head rotatably mounted on said frame, line pick-up means supported by said head and rockable through substantially 180° between closed and open positions, an axially reciprocating spool coaxial with said head, ring means surrounding said head and rotatable in relation thereto, gearing means connecting said ring means with said pick-up means, manual means for rotating said ring in a direction to shift said pick-up means from closed to open position through said gearing means, means for holding said pick-up means in the open position against a resetting force, said holding means being releasable by the rotation of the head, and means for imparting rotation to said head and reciprocating movement to said spool simultaneously.

---



2,773,655

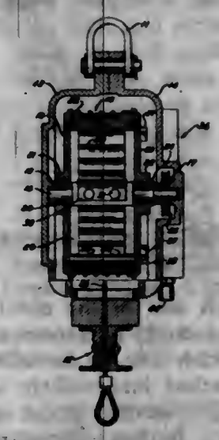
## FISHING REEL

Henry I. Mandolf, San Diego, Calif., assignor to Langley Corporation, San Diego, Calif., a corporation of California

Application October 31, 1952, Serial No. 317,981
2 Claims. (Cl. 242—84.4)

1. A fishing reel comprising a housing, a shaft reciprocally supported by said housing, a spool mounted on said shaft, a drive shaft journalled on said housing, a cowl carried by said drive shaft, a crank having an operative connection with both said reciprocating shaft and with said drive shaft for simultaneously reciprocating said spool and rotating said cowl, a line guide having a substantially semi-circular body portion, said body portion having a pivotal connection at each of its ends to said cowl whereby said line guide is movable relative to said cowl between a line-casting position and a position wherein it guides a fishing line for winding upon said spool on rotative movement of said cowl in a first direction, means for stopping said cowl at a predetermined location relative to said housing when said cowl

is rotated in reverse direction preparatory to a line-casting operation, and simultaneously limiting the extent of reverse rotation of said crank, said last mentioned means comprising a fixed stop on said cowl and a movable pawl on said housing, spring means normally maintaining said pawl in position for engagement with said fixed member to stop said cowl only on movement of said cowl in said reverse direction, a second fixed stop on said cowl, and manually actuatable means positioned on said housing adapted to be operated when said cowl has been stopped in said predetermined position to engage said second fixed stop to lock said cowl in such position to prevent rotative movement thereof in line-winding direction.



---

2,773,656

## SAFETY AND ADJUSTING DEVICE FOR CORD REEL

Rodger F. Becker, Kalamazoo, Mich.

Application June 17, 1955, Serial No. 516,268
4 Claims. (Cl. 242—107)

1. In a cord winding device, the combination comprising: a housing; a winding reel in said housing, said reel having spaced, circumferentially arranged reel rotation preventing means formed thereon; a shaft supporting said reel, said reel being capable of rotation relative to said shaft; spring means acting on said reel and urging said reel to rotate in a direction which will cause winding of the cord thereabout, one end of said spring means being fixedly mounted on said shaft, the other end of said spring being mounted for rotation relative to said shaft with said reel; a first gear means mounted on said shaft; a rotatably mounted rod; means urging said rod to move in one direction; a second gear means mounted on said rod and meshing with said first gear means; detent means projecting from said rod and adapted to engage said reel rotation preventing means when said spring is broken to prevent said reel from rotating; and means mounted on said rod capable of being rotated whereby rotation of said rod causes rotation of said second gear means which in turn causes rotation of said first gear means and said shaft to change the force exerted by said spring on said reel.

---

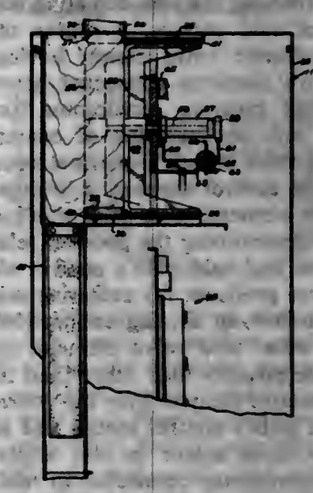
2,773,657

## PLASTIC JACKETED SPOOL

Louis H. Morin, Bronx, N. Y., assignor to Coats & Clark Inc., a corporation of Delaware

Application February 28, 1951, Serial No. 213,122
9 Claims. (Cl. 242—119)

2. A hollow, light weight thread spool comprising a body and a plastic shell around said body, said body comprising two transverse halves held together in the form of a spool by said shell, said body having flanged end portions, each said flanged end portion having a flat annular lateral surface, an annular plastic rim around each flanged end portion including said flat annular lateral surface, said plastic rim being integral with the adjacent shell and extending onto the end face of the flanged end portion, said flanged end portions having alined openings in the end faces thereof, the plastic shell and rims being die cast on said body and flanged end portions, said plastic rim being nickable to provide a thread-holding nick at a portion thereof covering said flat annular lateral surface, said nick being resistant to being broken away, and each said end face being adapted to receive and support a circular ticket label of a smaller diameter than the end face so as to expose a peripheral portion of the plastic rim.



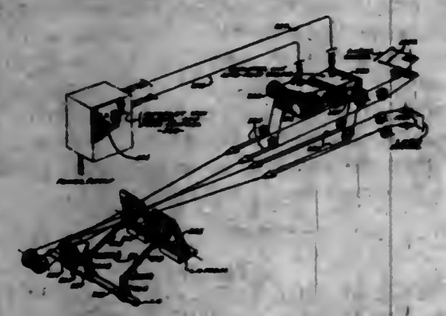
---

2,773,658

## TRANSFER DEVICE FOR CONVEYOR SYSTEM

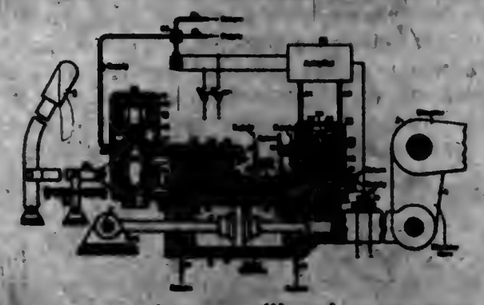
Wilbur M. Van Otteren and William J. Hafner, Detroit, Mich., assignors to The Grover Company, Detroit, Mich., a corporation of Michigan

Application August 26, 1954, Serial No. 452,242
27 Claims. (Cl. 243—1)



1. In a pneumatic conveyor system, a plurality of conveyor tubes, a transfer device having inlet tubes into

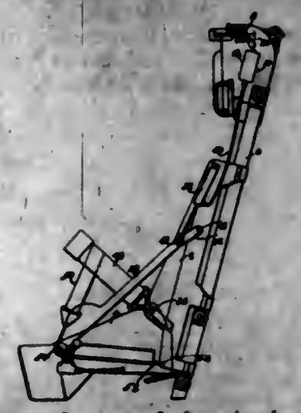
which said conveyor tubes connect, a common outlet tube, mechanical means in the transfer device operable to transfer carriers entering the same from said plurality of tubes into said common outlet tube, an electrical circuit associated with each inlet tube, an actuating switch in each inlet tube operable by a carrier therein to energize its circuit, a solenoid in each circuit operable when energized to cause actuation of the mechanical means to transfer a carrier from one inlet tube to the common outlet tube, a first relay coil in each circuit operable to open a first control switch in each of the other circuits so that when one circuit is energized the other circuits are opened, a second control switch in series with each first control switch, a second relay coil in each circuit operable responsively to the closing of its respective actuating switch to open a second control switch in another circuit, a shunt across said second control switch in each circuit, a switch in each shunt operable to close when its respective circuit is energized, whereby an energized circuit remains closed when said second control switch therein is opened, and another switch in each circuit operable to open its respective circuit after actuation of the mechanical means, whereby to de-energize said first relay therein for closing said first control switches and thereby prepare a circuit to be energized by its actuating switch.



---

**2,773,659**
**FULL POWERED HUMAN PILOT-AUTOPILOT AIRPLANE CONTROL SYSTEM**
Thomas A. Feeney, Sherman Oaks, Calif., assignor to Northrop Aircraft, Inc., Hawthorne, Calif., a corporation of California
Application April 19, 1952, Serial No. 283,208
7 Claims. (Cl. 244—76)

1. In an aircraft having a movable attitude control surface, a fluid pressure servomotor of relatively high power connected to move said surface, said fluid pressure servomotor forming the sole actuating mechanism for the movement of said surface, a source of fluid pressure, balanced hydraulic valve means having two relatively movable valve elements connected between said source and said fluid pressure servomotor for actuating said servomotor with no feedback of control surface loads through said valve means in normal operation, a human pilot's attitude control element, a linkage connecting one of said valve elements with said pilot's control element, said linkage determining the position relation of said one valve element and said pilot's control element and containing a force producer for centering said pilot's control element, a follow-up driving connection from said surface to the other said valve element, said valve means being the sole possible load other than linkage forces on said pilot's control element over the entire range of movement of said pilot's control means and said linked valve means, an attitude sensor in said airplane, a relatively low power servomotor connected to said sensor and actuated in accordance with the output of said sensor, said low power servomotor being attached to said linkage for operation thereof.

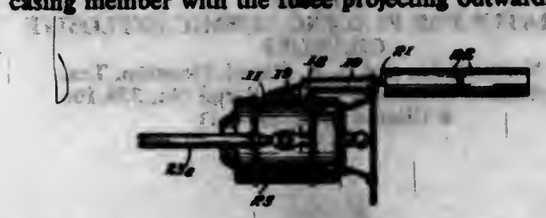


**2,773,660**
**FAIL SAFE POWER BOOST SYSTEM**
Arne P. Rasmussen, Glen Burnie, Md., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application August 20, 1953, Serial No. 375,546
21 Claims. (Cl. 244—85)

13. In a system for controlling the maneuver control means of an aircraft, the combination of, motor means having a moving part connected with said maneuver control means for effecting operation thereof, movable control means mounted on said moving part for controlling the flow of a power medium to said motor means, auxiliary motor means on said moving part and connected with said movable control means to effect operation thereof, an automatic pilot connected with said auxiliary motor means for controlling the flow of a power medium thereto, a link resiliently connected to said moving part of said motor means, a flight controller, and a decoupling linkage selectively connecting said movable control means and said link to said flight controller.

---

**2,773,661**
**AIRCRAFT EJECTION SEAT**
George G. Hudson, Torrington, Conn., assignor, by mesne assignments, to Reconstruction Finance Corporation, Washington, D. C.
Application August 1, 1955, Serial No. 525,467
8 Claims. (Cl. 244—122)



6. In an aircraft seat of the ejection type, the combination of a seat back; a pivoted seat bottom; a lap strap secured at each side of the seat to the seat back; a thigh strap attached intermediate its ends to the lap strap; an idler pulley secured to the seat bottom at each side thereof; and a flexible connector attached to each end of the thigh strap, said connectors passing about said idlers and being secured to the seat back, whereby upward pivoting of the seat bottom will tighten the thigh strap about the thighs of the seat occupant.

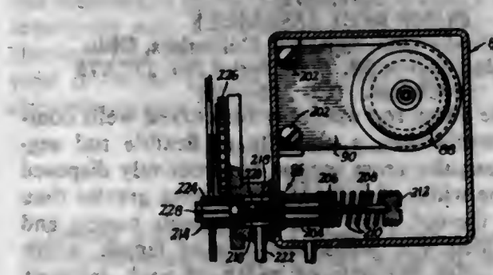
---

**2,773,662**
**FUSEE OR FLARE HOLDER**
Archie D. Ross, Laramie, Wyo.
Application January 15, 1953, Serial No. 331,339
4 Claims. (Cl. 246—488)

1. A lantern and fusee holder comprising a portable lantern having a housing and a carrying handle to facilitate transporting and manipulation of said lantern and a fusee for signalling while supported thereon, a base secured to said housing and having an open-ended casing member directed outwardly away from said housing and from said handle to receive the end of a fusee placed within said casing member, releasable gripping means carried by said casing member and engageable with the end of the fusee to retain same within said casing member with the fusee projecting outwardly away

from and beyond said housing and also away from said handle so that the lantern and fusee during burning for signalling purposes may be manipulated by grasping the handle without the operator being burned by the fusee flame, and actuating means operatively connected with said releasable gripping means to enable rapid release of said gripping means from engagement with the fusee and thereby free the fusee after use without necessitating direct manual contact with the spent fusee.

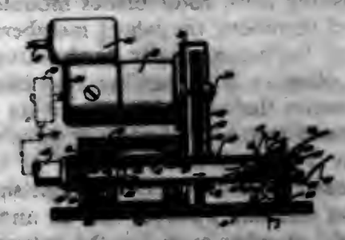
---



**2,773,663**
**COMBINED HOLDER AND CARRYING CASE FOR AN ELECTRICAL APPLIANCE**
George L. Beers, Haddonfield, N. J.
Application May 6, 1953, Serial No. 353,378
10 Claims. (Cl. 248—314)

1. A combined holder and carrying case for an electric appliance comprising a receptacle having a hollow interior, means associated with said receptacle operative to actuate a control switch on said appliance to the "off" position from its "on" position when said appliance is inserted in said case, and means to actuate said control switch to the "on" position when said device is removed from said case.

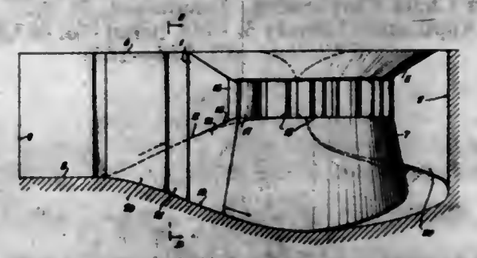
---



**2,773,664**
**RESTRICTOR VALVE**
Heel L. Bowditch, Foxboro, Mass., assignor to The Foxboro Company, Foxboro, Mass., a corporation of Massachusetts
Application February 18, 1954, Serial No. 411,168
1 Claim. (Cl. 251—276)

A valve for adjustably restricting the flow of an elastic fluid comprising, in combination, a valve body having a relatively long uniformly tapered passage formed therein, a uniformly tapered valve pin having substantially the same angle of taper as said passage and extending through said passage, a valve-pin-guide cap spaced from said valve body and having a central recess therein in which the larger end of said pin is positioned, a coil spring co-axially surrounding said pin and interconnecting said cap and said valve body adjacent to said passage, said spring being in tension to urge said pin in a direction to cause the pin to completely close said passage, and an adjusting member threaded into said valve body and positioned to engage said valve pin to move it against the tension of said spring to open said valve, said adjusting member having an axial bore formed therein within which the smaller end of said valve pin is positioned said adjustable member, said cap and said spring cooperating to maintain said valve pin co-axial with said passage and spaced from the wall of said passage except when said valve is fully closed.

---

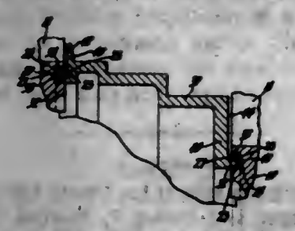


**2,773,665**
**HIGH SPEED OSCILLATING DEVICE**
Nelardus N. Berger and James P. Norton, Los Angeles, Calif., assignors to Hughes Aircraft Company, a corporation of Delaware
Application February 18, 1955, Serial No. 489,402
5 Claims. (Cl. 253—1)

1. In a device for producing oscillatory movement: a member mounted for oscillation about an axis; means positioned adjacent said member for limiting oscillatory movement of said member; a rotatable structure; a nozzle carried by said structure, said nozzle being positioned adjacent to and directed toward said member at a position spaced from the axis of oscillation thereof; passage means forming a portion of said rotatable structure for directing fluid under pressure from a source through said nozzle; and means for rotating said rotatable structure.

---

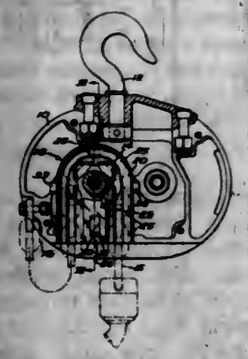
**2,773,666**
**SEMI-SPIRAL SCROLL CASE**
Gilbert Martin, Saint-Pierre d'Allevard, France, assignor to Etablissements Neyrpic, Grenoble, France, a corporation of France
Application June 10, 1953, Serial No. 360,691
Claims priority, application France August 28, 1952
9 Claims. (Cl. 253—26)



1. An improved semi-spiral scroll case comprising a frontal fluid conduit having a bottom surface that increases in width and slopes upwardly downstream along its longitudinal axis, said frontal conduit carrying about one third of the total fluid flow through said scroll case, and a separate spiral fluid conduit carrying the remaining fluid flow through said scroll case and having an upstream portion adjacent said frontal conduit and a downstream portion extending therebeyond, said upstream portion having a bottom surface that slopes down-

wardly downstream along its longitudinal axis, said downstream portion having a bottom surface that slopes upwardly downstream along its longitudinal axis.

---



2,773,667
**TURBINE ROTOR SEALING RING**
John R. Wheatley, Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application February 8, 1950, Serial No. 143,623
2 Claims. (Cl. 253—39)

1. A turbine rotor or the like subject to substantial thermal expansion in operation comprising, in combination, two adjacent coaxial rotatably mounted rotor wheel members having rims, rotor blades mounted on the rims of the wheel members, the wheel members including the rims thereof having mutually confronting faces spaced from each other, a rotor sealing ring member disposed entirely between the said wheel members at the rims of the wheel members, and oppositely directed connections between the ring member and each of the said wheel members, each said connection comprising an annular extension on one said member and an annular groove in the other said member receiving the extension, the extension entering the groove in the direction axially of the wheels; the edges of the ring member and the faces of the wheel members defining radially extending shoulders at the said connections, said radially extending shoulders being axially spaced with sufficient clearance to accommodate axial expansion of the wheel and ring members in operation; and the axially extending walls of the grooves being spaced apart by a radial distance greater than the radial thickness of the extensions to accommodate differential radial expansion of the wheel members and ring members in operation, said radial distance being such that the extensions seat against one axially extending wall of the grooves in operation and against the other axially extending wall when the rotor is cold.

---

2,773,668
**HOIST CHAIN GUIDE AND STRIPPER**
Erford E. Robins, North Tonawanda, and Humphrey F. Parker, Buffalo, N. Y., assignors to Columbus McKinnon Chain Corporation, Tonawanda, N. Y.
Application January 5, 1954, Serial No. 402,387
6 Claims. (Cl. 254—167)

6. In a chain hoist, a two piece split assembly frame comprising two frame parts each having bosses extending therefrom, a load lift wheel, and a chain guide device comprising a pair of matched members assembled in opposed united relation between said frame parts, the bottom central face portions of said members being apertured to accommodate said bosses and said assembled members engaging upon said frame bosses for positionally locking said guide devices in said hoist.

---

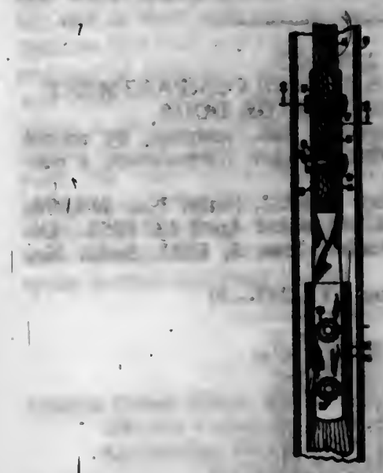
2,773,669
**APPARATUS FOR PLACING SEISMIC EXPLOSIVE CHARGES**
Joe Norman, Jr., and A. B. Hamill, Houston, Tex.
Application October 29, 1953, Serial No. 389,106
6 Claims. (Cl. 255—1)

1. Apparatus for placing an explosive charge beneath the earth's surface comprising a drill pipe, a drill bit, said drill bit having an explosive charge connected thereto, a quantity of ignition cable disposed adjacent the lower end of the drill bit, means connecting one end of the cable to the lower end of the drill pipe, means connecting the other end of the cable to the explosive charge, housing means enclosing said cable and said explosive charge, and releasable means connecting said drill pipe to said drill bit.

---

2,773,670
**DRILLING FLUID COMPOSITION AND METHOD**
George Miller, Arcadia, Calif., assignor to Oil Base, Inc., Compton, Calif., a corporation of California
No Drawing. Application June 9, 1952, Serial No. 292,579
10 Claims. (Cl. 255—1.8)

1. A drilling fluid composition comprising an oil base drilling fluid having added thereto discrete particles of asphalt having a penetration at 25° C. of from 0 to about 3 and a melting point of from about 250° F. to about 320° F., said asphalt particles being slowly soluble in hydrocarbons and adapted to be bonded together to form a mudsheath when exposed to the temperature and pressure conditions existing in a well hole.



---

2,773,671
**PUMP ROD ASSEMBLY**
Charles Isaac Leibensperger, Columbus, Ohio
Application March 20, 1952, Serial No. 277,675
4 Claims. (Cl. 255—28)

1. A flexible pump rod assembly for curved wells comprising, in combination, a plurality of flexible rod segments of rectangular cross section consecutively disposed end to end, the width of each segment being greater than the thickness thereof, each of said segments having end portions provided with holes, and axes of length, width and thickness with the axis of width of each segment being disposed at substantially ninety degrees to the axis of width of the next adjoining segment, and a coupling comprising a pair of metal straps each of which has a twisted center portion connecting plane end portions

which are disposed substantially ninety degrees to each other, with one plane end portion of each strap being lap joined to the end of a segment along the face of such segment corresponding to the axis of width and with the other plane end portion of said strap being lap joined to the end of the next succeeding segment along the face

of such segment corresponding to the axis of width, with holes in each of said plane end portions located to register with said holes in the adjoining segment end, and fastening means passing through the holes in said straps and said segment ends for securing same in lap joined relation.

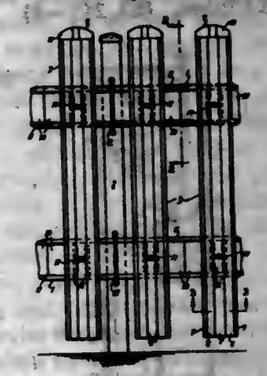
---

2,773,672
**DRILLING BIT**
Ellis C. Holmes, Levy, and William D. Greene, Little Rock, Ark.
Application September 17, 1952, Serial No. 310,036
4 Claims. (Cl. 255—61)

1. A drill bit comprising a rotary supporting shaft provided with a vertical slot opening on its lower surface and also at one side surface, a cutter blade secured in said slot and laterally projecting from the slot and also projecting below the extreme lower end of said shaft and there having a cutting edge, said shaft having a shallow slot extending transversely therethrough from the opposite side of the shaft with respect to that upon which the vertical slot opens, said slots at the central portion of said shaft being in intersecting communication, and a shallow guide disc mounted in the second mentioned slot having an interconnection with said blade at the location where said slots intersect, said disc having a portion thereof projecting beyond the outer surface of said shaft which is elongated circumferentially of said shaft.

---

2,773,673
**PILOT BIT**
Gerald Alger Monroe Peterson, Santa Clara, Calif.
Application March 4, 1954, Serial No. 414,007
11 Claims. (Cl. 255—61)

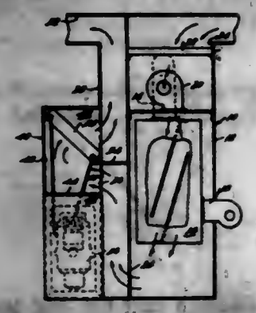


9. A pilot bit adapted for connection to a drill shaft for turning movement in a predetermined direction about an axis, comprising a cone-shaped body having a base of a mean diameter comparable to the diameter of said drill shaft for aligned connection therewith, a fish tail leader on the apex end of said cone-shaped body including a pair of chisel-like fins each having a cutting edge within the orbit of said mean diameter and disposed perpendicular to the axis of said cone-shaped body and beyond the apex end thereof, each said cutting edge being disposed at right

angles to a line bisecting said fish tail leader and in advance of an imaginary line traversing said line bisecting said fish tail leader at the axis of rotation of said pilot bit whereby the inner corners of said chisel-like fins engage earth in advance of the remainder of the same and exert a strain crosswise said fin.

---

2,773,674
**PICKET FENCE**
Allen Fischer and Karl A. Bamrill, Jr., St. Louis County, Mo.
Application November 29, 1954, Serial No. 471,827
8 Claims. (Cl. 256—22)



1. A picket fence, comprising a strip of sheet metal formed to provide a picket having a central bead extending therealong and inturned side edge portions, a horizontally extending shoe secured to said picket at said bead with its upper and lower edge portions engaging the side edge portions of said picket, and a supporting rail having in-turned flanges, said picket being attachable to said rail by inserting said flanges between said edge portions of said picket and said shoe whereby said flanges are gripped by spring pressure of said edge portions.

---

2,773,675
**AIR CONDITIONER**
Paul W. Wyckoff, Dayton, Ohio, assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Application August 22, 1952, Serial No. 305,859
12 Claims. (Cl. 257—9)

1. An air conditioning unit comprising a furnace having a vertically extending casing and a discharge duct mounted adjacent said furnace casing in parallel vertical relation thereto, said furnace casing and said discharge duct being provided with a fluid flow connection adjacent their respective base portions to define a generally U-shaped air path extending downwardly through said furnace casing and upwardly through said discharge duct, air propelling means within the upper portion of said casing adapted to cause air to travel said air path, apparatus for heating air within the lower portion of said

casing, said discharge duct being provided with a first opening in a side wall thereof, and a cooling device including a compressor, a condenser, a housing defining an evaporator compartment having a second opening in a side thereof and an evaporator located in said compartment, said cooling unit being mounted with said first and

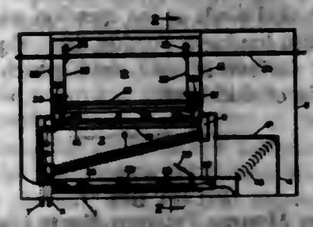
second openings in fluid flow communication, and a baffle in said duct between the upper and lower extremities of said openings adapted to cooperate with said openings to direct air travelling upwardly in said duct into said evaporator compartment over said evaporator and back to said duct downstream of said baffle.

---

2,773,676
SELF-CONTAINED HEATING, COOLING, AND VENTILATING SYSTEM
John R. Boyle and John R. Boyle, Jr., Chicago, Ill.
Application January 26, 1955, Serial No. 484,172
3 Claims. (Cl. 257—9)

1. In a self-contained unit for heating or cooling the air of an enclosure, the combination of a relatively tall narrow housing, a return air compartment in the lower portion of said housing receiving return air from said enclosure, a front air passageway extending upwardly in the front of said housing from said return air compartment, an oil heater in said front air passageway having a combustion chamber, an access opening in the front wall of said housing for affording access to said oil heater, a refrigerant evaporator in said front air passageway at a point above said oil heater, air impelling means receiving air from said front air passageway at a point above said refrigerant evaporator and discharging it from said unit into the enclosure, a rear air passageway in said housing in rear of said front air passageway, a fresh air duct supplying fresh air to said rear air passageway, a motor driven refrigerant compressor in said rear air passageway, a condenser in said rear air passageway receiving the refrigerant from said compressor for condensing it prior to its passage to said evaporator, an exhaust duct exhausting said rear air passageway to atmosphere, a combustion air supply duct drawing air from said rear air passageway at a point below said condenser for supplying combustion air to the combustion chamber of said oil heater, and a products of combustion duct leading from said combustion chamber to said rear air passageway at a point above said condenser, whereby the combustion air supply and the products of combustion are drawn from and returned to said rear air passageway in a shunt path around said condenser.

---

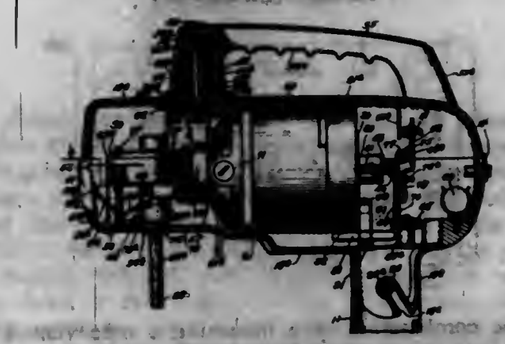


2,773,677
INNER LINER WITH BUTTER COMPARTMENT FOR REFRIGERATOR DOOR
Lester H. Hinkel, Evansville, Ind., assignor, by mesne assignments, to Whirlpool-Seeger Corporation, a corporation of Delaware
Original application May 3, 1952, Serial No. 285,878, now Patent No. 2,706,140, dated April 12, 1955. Divided and this application June 5, 1953, Serial No. 359,845
3 Claims. (Cl. 257—9)

1. In a refrigerator door structure, an inner liner formed of a thermally non-conductive material and having a butter compartment integrally formed therein, said compartment having a groove integrally formed in the rear and side walls thereof, a thermally conductive plate slidably received within said groove and adapted to support a quantity of butter thereon, a heating element secured in heat exchange relation to said plate and disposed within said compartment, manual means for controlling the operation of said heating element, said plate being provided with a front portion which extends below the bottom wall of said compartment, hinge butts provided on said front portion, a compartment door formed of a thermally non-conductive material and pivotally secured to said hinge butts, said front portion being provided with a cut-out portion adjacent the lower edge thereof, said manual means being secured to said plate and positioned between the bottom wall of said compartment and said plate adjacent said cut-out portion, and detachable means for securing the front portion of said plate to said inner liner.

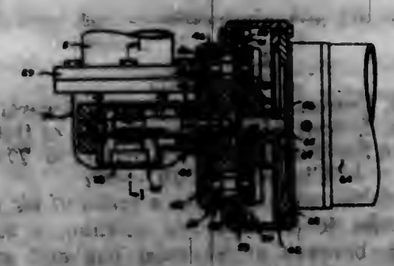
---

2,773,678
AIR CONDITIONING APPARATUS
Lance L. Shannon, Detroit, Mich., assignor to American Blower Corporation, Dearborn, Mich., a corporation of Delaware
Application December 26, 1951, Serial No. 263,258
3 Claims. (Cl. 257—137)



1. In an air conditioning apparatus for exchanging heat with a space, an outer casing, conduits for conducting a heat exchange fluid therethrough, an inner casing enclosing said conduits, a conduit for conducting air from an external source to said inner casing, one or more apertures in said outer casing operable to permit some of the air from said space to enter said outer casing, said inner casing having a discharge opening positioned beyond said heat exchange conduits and operable to discharge said conducted air after passing over said heat exchange conduits, one or more apertures in said outer casing operable to discharge said conducted air, one or more openings in the wall of said inner casing opening into said outer casing, a damper for each of said last-named openings and operable to close said openings, said dampers being urged toward a normally open position, a member responsive to the velocity of said conducted air and operatively connected to said dampers to close the same when said air is flowing, and said responsive member being operable to permit said dampers to open in the event of cessation of air flow through said inner casing thus permitting some of the air from said space to enter said inner casing.

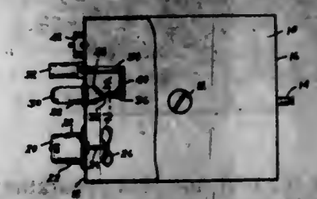
---



2,773,679
MIXER
Marion Frank Miller, Villa Park, Ill., assignor to Birtman Electric Company, a corporation of Illinois
Application May 3, 1954, Serial No. 427,240
4 Claims. (Cl. 259—1)

1. In an electric mixer including a removable rotatable beater and an outer casing including a front opening, a beater ejector, comprising: a support member on the mixer within the casing; an ejector plate rockably mounted within the casing having one end adapted to engage a portion of the beater and move the beater away from the mixer on rocking movement of the plate and the other end extending toward said opening; an operating member oscillatably mounted in the opening for movement toward the interior of the casing and bearing against said other end of the ejector plate for thusly rocking said plate upon said movement of the operating member; and spring means urging said plate and operating member into their normally retracted positions.

---



2,773,680
AGITATORS
Igor V. Zozulin, Vancouver, British Columbia, Canada, assignor to Torsaq Transmissions Limited, Vancouver, British Columbia, Canada
Application March 28, 1955, Serial No. 497,080
3 Claims. (Cl. 259—108)

1. In a fluid agitating device including a vertical shaft operatively connected to an impeller and adapted for upward extension through the base of a tank, said shaft being operatively connected through a horizontal shaft to a magnetic coupling having a pair of opposed rotors separated by a diaphragm from a driven shaft fitted to one of said rotors, said horizontal shaft and part of the driven shaft being in a housing sealed at one end by the diaphragm and sealed adjacent the vertical shaft by an air lock subject to pressure developed by static fluid in the tank and an annular thrust ring carried by the driven shaft and applied to a face of the diaphragm for supporting the diaphragm against the pressure developed within the housing, a spring surrounding the driven shaft, said spring bearing against a housing part and urging the annular thrust ring against the diaphragm and exerting a thrust on one of said rotors towards said diaphragm.

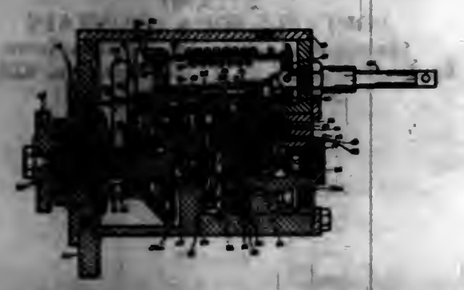
---

2,773,681
PORTABLE SODA FOUNTAIN
Harold R. Robbins, Des Moines, Iowa
Application April 29, 1954, Serial No. 426,404
5 Claims. (Cl. 261—93)

1. Apparatus for carbonating water, comprising, a container for water having an inlet and valve controlled outlet for the water, an agitator means mounted on said container so as to extend into the interior thereof, an electric circuit designed for connection to a source of electric power, an electric motor connected to said electric circuit for driving said agitator means, a cartridge containing carbon dioxide gas, said cartridge being of the type requiring puncturing at one end to release the gas therefrom, said container provided with an opening into which said cartridge can be manually partially inserted so that the puncturable end thereof extends into said container, an electrically operated punch means mounted on said container for puncturing said cartridge and connected to said electric circuit in series with said electric motor, and a manually operated switch means in said electric circuit whereby operation of said punch means and said electric motor can be placed into or out of operation simultaneously.

---

2,773,682
BURNER SUPPORT FOR OPEN HEARTH FURNACES
Charles J. Barkley, Orem, Utah, assignor to United States Steel Corporation, a corporation of New Jersey
Application January 19, 1953, Serial No. 332,006
6 Claims. (Cl. 263—15)



1. In an open hearth furnace having a plurality of buckstays at one end, a chill structure spaced inwardly from the end of said furnace, an uptake from the regenerative chamber between the end of the furnace and the chill structure, and a burner supporting structure divid-

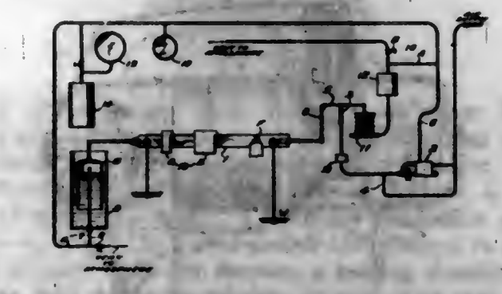
ing said uptake into two passageways; the improvement comprising a box-like metallic liner burner supporting structure having one end connected to said buckstays and the other end connected to said chill structure, a refractory arch suspended from the bottom of said box-like metallic supporting structure, a vertical refractory wall fastened to each side of said box-like metallic supporting structure, and a refractory wall connecting the tops of said vertical refractory walls.

---

2,773,683
GOVERNOR FOR FUEL INJECTION
Thomas D. Hess, Agawam, Mass., assignor to American Bosch Arma Corporation, a corporation of New York
Application June 19, 1952, Serial No. 294,516
4 Claims. (Cl. 264—3)

1. A governor for fuel injection apparatus comprising, a shaft, centrifugal means operatively connected to said shaft and rotated thereby, a slidable member carried by said shaft and movable on said shaft by the force of said centrifugal means, a lever operatively connected intermediate its ends to said slidable member, a stationary pivot member adjacent one end of said lever and forming a slidable pivot connection for said lever, said lever being pivotally connected adjacent one end to said slidable pivot connection, stop means adapted to engage the end of said lever opposite said slidable pivot, resilient means operatively connected to said lever and slidable member and to the throttle for urging said lever toward said stop and said slidable member against the force of said centrifugal means, said resilient means pivoting said lever about said stop upon further movement of said slidable member upon reduction of speed of said shaft after engagement of said lever with said stop.

---



2,773,684
SPEED GOVERNORS FOR LIQUID FUEL INJECTION PUMPS FOR INTERNAL COMBUSTION ENGINES
Berrie Temple Black, Richmond, England, assignor to C. A. V. Limited, London, England
Application April 9, 1954, Serial No. 422,225
Claims priority, application Great Britain April 15, 1953
1 Claim. (Cl. 264—3)

In a speed governor for a liquid fuel pump having a slidable control bar movable between two limit positions for regulating the pump output, the combination of a centrifugal mechanism, a spindle for driving said mechanism, a lever for imparting movement to the control bar under the action of said mechanism, a member arranged coaxially with and rotatable by said spindle, said member having an axial bore therein, a cylindrical bush slidable in said bore and rotatable with said member, a spring-loaded stem axially slidable in said bush, a pair of collars provided respectively on one end of said stem and the adjacent end of said bush, a part on said lever being situated between said collars so that joint axial movement of said stem and bush is accompanied by movement of said lever, a pair of abutments provided respectively on the other ends of said bush and stem, a laterally movable transverse member operable by said centrifugal mechanism and situated between said abutments so that lateral movements of said transverse member are accompanied by joint movements of said bush and stem, and a manually adjustable lever on which the first mentioned lever is mounted so that adjustment of said manually adjustable lever serves to vary the position of the fulcrum of the first mentioned lever irrespective of the axial position of the control bar, and without affecting the position of the centrifugal mechanism.

---

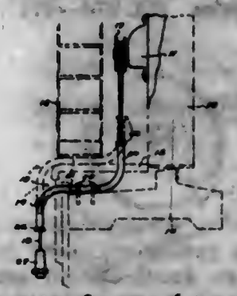
2,773,685
WEIGHT RECORDER
Fridtjof Aagaard, Rahway, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine
Application June 19, 1951, Serial No. 232,441
4 Claims. (Cl. 265—5)

4. The combination of a manostat; a pipe vented at one end to the atmosphere through a Bunsen burner valve, said pipe having sealed into the other end a small capillary tube the end of which is so orientated that it is directed away from said Bunsen valve; a conduit communicating with said manostat at a point between said Bunsen valve and said capillary tube; a pivoted balance beam; the movable element of said manostat being connected to the one end of said balance beam; the other end of said balance beam being connected to one end of a flapper valve; and the other end of said flapper valve being connected to a bellows; a nozzle positioned adjacent to said flapper valve; and communicating means between said nozzle and said bellows, whereby any change in pressure within said nozzle will be translated to said bellows and thereby move said flapper valve so as to avoid any change in the position of said balance beam; communicating means between said nozzle and a pressure relay; and automatic recording pressure gauge which measures the output pressure of said pressure relay, said pressure relay being actuated by pressure variation within said nozzle resulting from movement of said flapper valve with respect to said nozzle; and communicating means between the output of said pressure relay and said capillary tube.

---

2,773,686
AIR SPRING
Carl B. Nash, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application September 17, 1947, Serial No. 774,646
10 Claims. (Cl. 267—65)

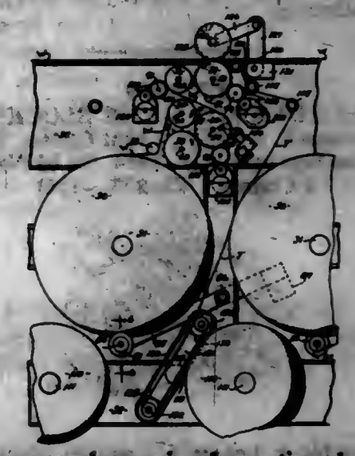
1. In a variable rate air spring, a series of air bags arranged in series load supporting relation, a relatively small passage between an endmost bag and an intermediately positioned bag restrictive of the rate of air flow therebetween, a larger but restricted passage connecting an intermediately positioned air bag and the other endmost air bag and controlling the rate of air flow therethrough, and an air pressure reservoir in relatively



free open communication with the last mentioned air bag.

---

2,773,687
CLOSURE OPERATOR
Vernon W. Koehler, Fort Lauderdale, Fla.
Application September 28, 1953, Serial No. 382,711
1 Claim. (Cl. 268—21)

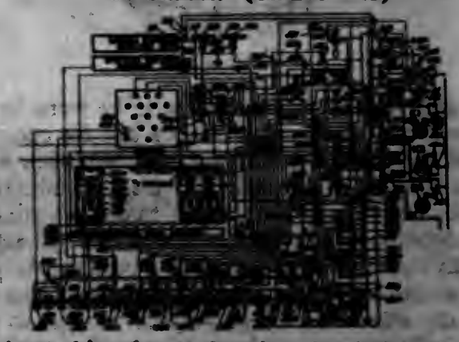


A closure operator for panel type windows wherein a plurality of panels are simultaneously shifted to open or closed position under the influence of a geared operator having a shaft, a grooved pulley fixed upon the shaft, the pulley being vertically arranged and at an angle with respect to the window, a cable wrapped about the pulley and having extended ends depending therefrom at opposite sides of the pulley, a cable guide device that is rigidly supported adjacent the window and the geared operator, the guide device comprising a pair of spaced apart and parallel tubes rigidly connected together by an attaching web, the tubes embodying horizontal sections that are in the same horizontal plane and that are bent upwardly at one end to form a pair of risers open at their ends, the risers being offset with respect to each other whereby their open ends underlie the axial center of the depending cables from the pulley, the opposite ends of the horizontal sections being bent downwardly at a right angle to provide tubular legs that are in the same vertical plane, the extended cable ends slidably passing through the tubes to project to a point below the ends of the legs and with the free end of each cable end provided with a pull knob, the guide conducting the cable ends to a point of operation remote from the geared operator whereby the geared operator may be rotated by the pulley under the influence of a manual actuation of the cable.

---

2,773,688
WEB MANIFOLDING METHOD AND APPARATUS
James B. Falk, Los Gatos, Calif., assignor, by direct and mesne assignments, of one-half to Fred A. Ross, Green Bay, Wis.
Application June 5, 1951, Serial No. 230,008
5 Claims. (Cl. 270—18)

1. The method of making manifold forms, comprising providing a plurality of supply rolls of webs of stretchable material, individually withdrawing the webs from the respective supply rolls, passing each withdrawn web to and through a respective pair of rotary drums having a plurality of equi-spaced male and female punches to provide each web with a longitudinally extending row of identically spaced registration openings at least along one edge thereof, passing each web from its punch carrying drums, to a drum having a peripheral row of spaced pins to engage the registration openings, collating the webs by passing them from their respective pin drums across other webs while such other webs are engaged by their respective pin drums, imprinting at least one of the webs in the region of the web extending from the point of the withdrawing operation to the point of departure of such web from its pin drum, rotating the punch and pin drums at the same rate of peripheral speed, individually varying the rate of speed of passage of each web to its respective punches, whereby the webs of varying degress of stretchability may be simultaneously imprinted, and then collating the webs in a relaxed condition with their imprints in registration.



5. An apparatus for printing a web of material in accurate registration with a row of punched holes extending along one edge thereof comprising a frame constituting a support for a roll of material, a withdrawing drum rotatably supported on the frame and having the web

wrapped therearound, a pair of coacting drums carried by the frame and arranged to engage the web after it leaves the withdrawing drum and having means thereon to punch a row of holes at regular intervals on the web, another drum carried by the frame and having pins in the periphery thereof spaced for engagement with the row of perforations in the web, said web being wrapped around the last-named drum, there being a predetermined fixed distance between the punching drums and the pin drum, means for rotating the punching drums and the pin drum at the same peripheral speed, means for adjusting the speed of rotation of the withdrawal drum so as to vary the rate at which the web is fed into the punching drums, whereby a substantially uniform length of web is maintained on that portion of the strip between the point of punching and the point of engagement with the pin drum.

---

2,773,689
AUTOMATIC PIN SPOTTER CONTROL MECHANISM
Morehead Patterson, New York, and William C. Brooklayson, Brooklyn, N. Y., assignors to American Machine & Foundry Company, a corporation of New Jersey
Application June 2, 1950, Serial No. 165,794
10 Claims. (Cl. 273—43)

1. A machine for performing the duties of a pin boy on a bowling alley comprising means for placing a new

set of pins on a bowling alley, apparatus for removing fallen pins from the bowling alley, a detector having a control circuit comprising ten normally open switches connected in series and each adapted to be actuated by a separate standing pin, and a second control circuit adapted to bypass the switches actuated by pins 7 and 10 on 1st ball only, an electrical sequence control circuit for moving said means, apparatus and detector through one sequence of operations after a first ball is thrown and through another sequence of operations after a second ball is thrown, a device for interrupting that portion of the circuit which operates said apparatus, and connections between the control circuits of said detector and said electrical sequence control circuit for automatically actuating said device each time the switches in said first and second control circuits permit current to flow therethrough.

---

2,773,690
**HOLDER FOR GAME BLOCKS**
Thomas P. Hensley, Coral Gables, Fla.
Application September 21, 1954, Serial No. 457,365
2 Claims. (Cl. 273—130)

2. A game block holder for square blocks of a predetermined size comprising a pair of spaced parallel plate members, said plate members having on the exterior faces thereof a plurality of spaced parallel portions for frictional gripping engagement of blocks therebetween, said portions being disposed to provide a plurality of block receiving spaces on each of said faces, connecting members between said plate members, and additional spaced parallel portions on certain of said connecting members for frictional gripping engagement of blocks therebetween, the spaces between said additional portions providing additional block receiving spaces, said block receiving spaces being disposed in a plurality of horizontal and in a plurality of vertical planes.

---

2,773,691
**ARM GUIDING MEANS FOR GOLF STROKE**
Frank E. Redfield, Dumont, N. J.
Application May 22, 1953, Serial No. 356,688
3 Claims. (Cl. 273—189)

2. In a golf stroke guiding harness to be worn by golf players, the combination comprising: a belt for encircling the body of the player when in use, said belt when so encircling the body defining a reference plane; a substantially rigid guide rail secured to such belt, said guide rail commencing substantially in the plane of said belt and extending upwardly therefrom and outwardly from the side of the belt when so in use; means for restricting the swing path of one of the elbows of the player with respect to such guide rail, including an arm band member for encircling such arm and a trolley hook connected to such band member, such trolley hook being connected to, slidable along and restricted to follow said guide rail in a selected path, the latter having a limit-stop at its upper extremity but being free of such limit-stop at its lower extremity, said trolley hook thus being free to move off said guide rail when such hook is moved to the lower extremity thereof, said arm band and trolley hook being interconnected by cord means of a selected relatively short length whereby such elbow is guided during the down swing in a selected zone substantially co-extensive with the zone of said guide rail, the free movement off said guide rail by said trolley hook allowing free follow-through of the swing of the golf player.

---

2,773,692
**BRUSH CARRYING DEVICE**
Ralph B. Dunsavage, Minneapolis, Minn.
Application May 15, 1950, Serial No. 161,855
1 Claim. (Cl. 274—47)

In connection with a record player having an elongated substantially channel-shaped playing arm adapted to carry a plurality of needles and playable in a plurality of operating positions having in combination, a U-shaped bracket extending substantially longitudinally about and horizontally embracing the outer end portion of said arm, said bracket having its rear bottom edges reversely bent upwardly to embrace the bottom edge portions of the side flanges of said playing arm and a spring extending across the top of said arm connecting the sides of said bracket and urging said bracket into engagement with said arm, a member pivotally secured at its inner end about a horizontal axis to the front end portion of said member and extending forwardly and inclined inwardly thereof, and a brush depending from the outer end portion of said member whereby said member and said brush are movable freely upwardly and downwardly in relation to the playing arm and are adaptable for use with said arm in any of said plurality of operating positions of said arm.

---

2,773,693
**POSITIVE SHANK-LOCKING MEANS FOR COLLET-HELD CUTTING TOOLS**
Windsor N. Chittenden, Bedford Heights, Ohio
Application May 20, 1954, Serial No. 431,267
7 Claims. (Cl. 279—46)

1. In a device for holding shank-type cutting tools the combination of a chuck body and a cylindrical bored portion and an outwardly tapered socket extended therefrom, a spring-type collet having exterior surfaces complementary to said bore and taper, a cylindrical tool shank adapted to be gripped by the collet and means for engaging and moving the collet in the taper to effect such gripping and axial aligning action of chuck body and collet and shank, a locking and driving element fitting into the cylindrical bore portion a projection right with the chuck body removably engaging and coacting with said element for effecting a driving action while preventing longitudinal movement thereof, a transversely slidable interlocking shoulder on said element and on said shank whereby the shank and element may be assembled outside of the chuck and inserted therein.

---

2,773,694
**DEVICE FOR AUTOMATIC LATHES TO FEED AND HOLD WORK**
Paul Freiherr von Poellnitz, Koln, Germany, assignor to Alfred H. Schutte, Koln-Deutz, Germany, a German company
Application October 2, 1953, Serial No. 383,832
Claims priority, application Germany November 13, 1952
4 Claims. (Cl. 279—61)

1. Device for automatic lathes to feed and hold rods or similarly shaped work, comprising a feed chuck and a collet chuck, the former chuck extending axially and partly through the latter chuck, the collet chuck having jaws, said jaws being upwardly provided with interior recesses, the feed chuck being provided with extensions to matingly engage the said recesses, the work-gripping surface along a portion of the length of the work being worked on being thus formed both by the feed chuck and the collet chuck.

---

2,773,695
**REVERSIBLE BICYCLE FRAME**
Robert L. Hollowell, Snyder, N. Y., assignor to American Machine & Foundry Co., a corporation of New Jersey
Application August 12, 1953, Serial No. 373,773
2 Claims. (Cl. 280—7.11)

1. A convertible bicycle which is convertible into either a boy's or a girl's bicycle comprising a frame having a head post adapted to have a front fork mounted therein, and a saddle post having identical means at the opposite ends thereof for receiving and fixedly holding a post, a rear fork having one end connected to and extending from one end of said saddle post, a cross bar interconnecting the opposite end of said saddle post to said head post, said saddle post, cross bar and rear fork being of a geometric configuration when viewed from the left side as used for a boy's bicycle which will permit the frame to be turned up-side-down to convert the bicycle into a boy's or girl's bicycle, a seat having a supporting post mounted in that one of said identical means at the upper end of said saddle post, and a pedal crank hanger having a post of substantially the same configuration as said seat post for supporting the crank hanger in that one of said identical means at the lower end of said saddle post.

---

2,773,696
**SMALL TRAILERS FOR CARRYING THE FRONT END OF A TRACTOR**
Vaniman George, Birmingham, Ala.
Application September 21, 1953, Serial No. 381,273
1 Claim. (Cl. 280—47.12)

A small trailer of the class described comprising a pair of wheels, a wide U-shaped axle mounted between and attached to said wheels, a platform attached upon the low portion of said axle, a ramp pivotally attached to the rear edge of said platform; a wide A-shaped bracket assembly attached by its lower ends by bolts and nuts to the upper portions of said axle adjacent the wheels, a cradle-type bar attached by its center to a pivot bolt in the center of the top portion of said wide A-type bracket assembly; chain and hook means adapted for holding said ramp in its perpendicular position and said A-type bracket assembly in a locating position.

---

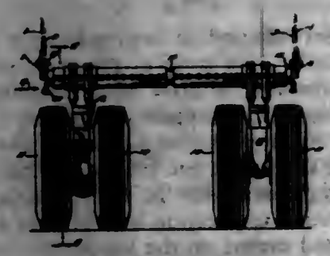
2,773,697
**STEERING IDLER SUPPORT**
Arnold J. Pitchford, Camargo, Okla.
Application December 21, 1953, Serial No. 399,473
4 Claims. (Cl. 280—95)

3. A support adapted to interconnect a steering idler arm and an idler arm bracket pivotally supporting one end of the arm with a pivot shaft forming the pivotal axis therebetween, said support comprising a substantially right angular member having a vertical and a horizontal leg, means at the upper end of the vertical leg for rigid clamping engagement with the idler arm in spaced relation to the pivotal connection between the idler arm and the bracket, and means on the horizontal leg for engagement with the undersurface of the bracket directly under the pivot shaft thereby preventing tilting movement of the idler arm in relation to the idler arm bracket, said means on the horizontal leg including an enlarged socket with an internally threaded bore extending through the bottom of said socket, a ball member having a threaded stud integral therewith and disposed in said bore, a saddle member being positioned in said socket and engaging the undersurface of the bracket, said saddle member having a semi-spherical recess receiving said ball member, and means on the end of said stud for engagement by a tool for adjusting the height of said saddle member thereby adjusting the force of contact between the saddle member and bracket.

---

2,773,698
**RESILIENT MOUNTING IN THE FORM OF A BUSHING AND AXLE ASSEMBLY FOR VEHICLE SUSPENSION SYSTEMS AND THE LIKE**
Charles O. Shumaker and Robert Bernard [illegible], Akron, Ohio, assignors to The General Tire & Rubber Company, Akron, Ohio, a corporation of Ohio
Application August 22, 1952, Serial No. 305,726
11 Claims. (Cl. 280—124.5)

1. A vehicle suspension system of the type comprising a pair of spaced generally parallel axles for mounting

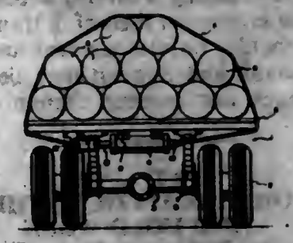


wheels, one axle being located ahead of the other, a pair of spaced beam members extending between and connecting the axles in the provision of a running gear frame, and resilient means interposed between the running gear frame and the body of the vehicle, said system being characterized by deformable bushing assemblies in the connection of each axle to each beam member, said bushing assemblies each comprising a resilient deformable cushion confined between the axle and the beam and extending

circumferentially with respect to the axle so that pressure on the cushion due to vertical or horizontal distortion of the running gear frame forces the cushion to flow axially along the axle, and retainer means mounted on the axle and engageable with an end portion of the resilient cushion, said retainer means being located at the sides of the axle to restrain axial flow of the cushion induced by horizontal distortion more than that induced by vertical distortion of the running gear frame.

---

2,773,699
**TRAILER REAR WHEEL TORSION SPRING SUSPENSION**
Leroy Grumman, Plandome Manor, N. Y., assignor to Grumman Aircraft Engineering Corporation, Bethpage, N. Y., a corporation of New York
Application January 17, 1949, Serial No. 71,359
2 Claims. (Cl. 280—124)



1. In a trailer wheel suspension and in combination, a torque spring comprising an inner member attached at each end to the trailer and extending horizontally and transversely thereof, an outer member for each side of the trailer surrounded and supported by the inner member and rubber or the like elastic material between the two outer members and inner member bonded to and joining the same together, an arm for each side of the trailer, means attaching a said arm at one end to each said outer member for pivoting movement therewith about the inner member, and wheel mountings attached to the other end of each said arm and on each side thereof for carrying a pair of wheels, the inner member comprising two tubular elements, one within each of the said outer members and held in alignment by a sleeve within their adjacent ends.

---

2,773,700
**AUTOMATIC TENSION MAINTAINING LOAD BINDER FOR VEHICLES**
Harry A. Lanswell, Little Rock, Ark.
Application January 14, 1954, Serial No. 404,044
13 Claims. (Cl. 280—179)

1. A load binder for a vehicle comprising means to tie a load to the vehicle, means to automatically maintain a selected tension on said tying means, and sensing means responsive to a decrease in tension on the tying means

below a preset level to render said automatic means operative.

---

2,773,701
**SAFETY DEVICE FOR TRACTOR-TRAILER FIFTH WHEEL**
William T. Sefko, Short Hills, N. J.
Application March 28, 1955, Serial No. 496,820
4 Claims. (Cl. 280—432)

1. In a tractor-trailer combination, a tractor having a fifth wheel member including a flat body portion having a guide slot extending inwardly from its rear end and a trailer having a coupler base with a depending kingpin to engage in said slot; said base having a pair of openings therein spaced equal distances one on each side of said kingpin laterally of said base, a pawl hingedly connected inwardly from its ends above said coupler base with its lower end extending through each of said openings and resting upon said fifth wheel plate, means yieldably urging said pawls into engagement with said fifth wheel plate, and selective means for manually retracting said pawls, one of said pawls adapted to project into and engage a wall of said slot when the movement of the fifth wheel with respect to the coupler base brings the pawl opening in alignment with said slot.

2,773,702
**JACK-KNIFING PREVENTING DEVICE FOR TRACTOR-TRAILERS**
William T. Sefko, Short Hills, N. J.
Application May 16, 1955, Serial No. 508,476
6 Claims. (Cl. 280—432)

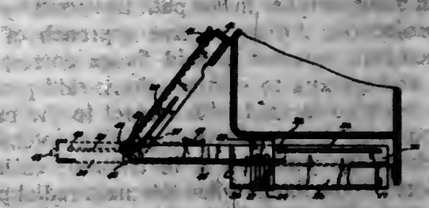
1. In a tractor trailer combination, a tractor having a fifth wheel member including a flat body portion having a guide slot and a trailer having a coupler base resting upon said fifth wheel member; a frame having a slot therein secured to said coupler base with its slot overlying and disposed transversely of said guide slot, a head mounted in said frame and slidable therein parallel with said frame slot, equalizing springs maintaining said head midway the ends of said slot, a locking pin mounted in said head for movement at right angles to the plane of said flat body portion, means for projecting said pin into said guide slot and into the path of the side edges of the latter, and a stop on said coupler base to limit the movement of said head therein.

2,773,703
**QUICKLY DETACHABLE WHEELED TOW BAR**
Lachlan Grant Ferguson, Pacific Palisades, and Carmine G. Montanaro, Jr., Los Angeles, Calif., assignors to Northrop Aircraft, Inc., Hawthorne, Calif., a corporation of California
Application February 5, 1954, Serial No. 408,332
4 Claims. (Cl. 280—476)

1. A two part airplane tow bar assembly having a draft bar part and a yoke member connected together by shear pins characterized by the fact that said yoke portion is provided with wheel axle retaining means which comprise: mounting portions incorporated in the yoke arms and having axially aligned through bores, and aligned holes in the wall of said mounting portions on an axis intersecting said through bores; an axle retaining member positioned in and axially movable in each of said bores and provided with a longitudinally extending slot therethrough; and a locking pin extending both through the slot in each of said axle retaining members and the aligned bores in said mounting portions, said locking pin and axle retaining means being formed so as to enable the axle retaining members to be moved into operative position and then locked therein.

---

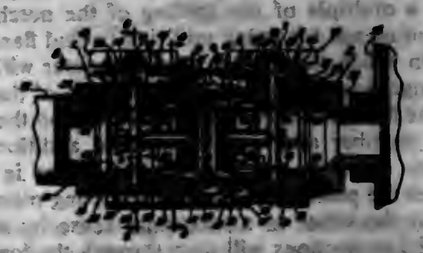
2,773,704
**RESILIENT DRAFT MEANS WITH PLURAL ARTICULATION AXES**
Cecil C. Saxon, Terre Haute, Ind.
Application July 30, 1954, Serial No. 446,799
5 Claims. (Cl. 280—489)



1. A hitch comprising an upstanding housing, a tongue for attachment to a trailer arranged longitudinally of said housing and connected to said housing adjacent one end of said housing for swinging movement about a vertical axis, an upstanding connector member arranged adjacent said one end of said housing and connected to said housing for rocking movement about a horizontal axis, a leaf spring positioned within said housing and having one end fixed to said housing adjacent the other end of said housing and having the portion adjacent said one end of said housing extending in an upright direction toward said connector member, means carried by said connector member and bearing against the upright portion of said leaf spring for holding the latter in its upright position, a second tongue including a female coupling tube for attachment to a towing vehicle arranged on the side of said connector member remote from said housing, a male coupling tube fixedly carried by said connector member and insertable into and withdrawable from said female coupling tube, and detachable interlocking means on said male and female coupling tubes for securing said coupling tubes together.

---

2,773,705
**WRITING PAD SUPPORT OR DESK FOR VEHICLES**
Joseph Hirak, Toronto, Ontario, Canada
Application February 24, 1954, Serial No. 412,275
4 Claims. (Cl. 281—44)

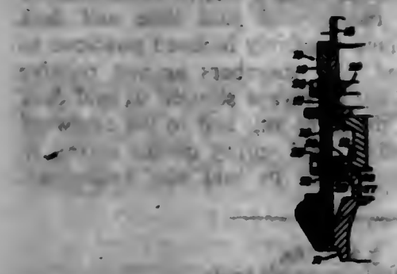


1. A writing desk for vehicles comprising a support having spaced longitudinal guide members, means for securing said support beneath a dashboard, a slide sliding on said guide members, said slide and guide members having a slot and pin interlock therebetween, a desk member having longitudinally slotted sides, pin means on said slide engaging in the slots of said desk member sides to support said desk member for horizontally slidable and pivotal movement relative to said slide, the slots

of said desk member sides having lateral extensions to receive said slide pin means with said slide and desk members in predetermined relatively inclined positions to maintain said slide and desk members against relative sliding movement, and spring means secured to said desk member at one side of the pivot axis and to the rearward end of said slide member, said spring means acting to maintain said slide pin means in said slot extensions.

---

2,773,706
**VALVED COUPLING**
Ira A. Leavell, Alhambra, Calif., assignor to E. B. Wiggins Oil Tool Co., Inc., Los Angeles, Calif., a corporation of California
Application October 10, 1952, Serial No. 314,193
13 Claims. (Cl. 284—19)

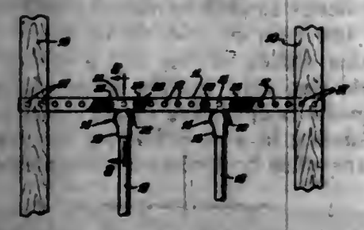


1. In a valved coupling: a pair of axially separable coupling members having through bores cooperable when said members are coupled to form a passage through said members; locking means on one of said members engaged with the other of said members for holding said members in coupled relation; sleeve means on each of said members; releasing means on one of said sleeve means for releasing said locking means; valve means in each of said members; valve operating means in each of said valve means for opening and closing said passage; restraining means carried by each of said valve operating means and each of said sleeve means respectively, for preventing sliding of the sleeve means in a direction for releasing said locking means when either of said valve means is open; and means releasing said sleeve means for sliding in a direction for the release of said locking means when both of said valve means are closed.

---

2,773,707
**SELECTIVE INTERLOCKING LUG COUPLING**
John Fraser, Tolworth, Surbiton, England, assignor to Avery-Hardoll Limited, Tolworth, Surbiton, England
Application December 10, 1953, Serial No. 397,369
Claims priority, application Great Britain December 11, 1952
2 Claims. (Cl. 285—27)

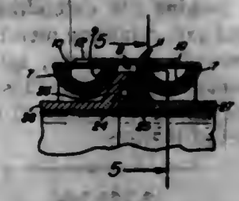
1. A bayonet-type coupling comprising first and second coupling members, main radial projections on said first coupling member, means defining axially facing surfaces on said second coupling member for engagement by said radial projections to hold the coupling members in coupled relation, longitudinal notches guiding said radial projec-



tions into position for engaging said axially facing surfaces, a plurality of additional radial projections selectively positionable about the axis of one coupling member, means defining a plurality of positions for said additional radial projections about the axis of said one coupling member the number of positions being a multiple of the number of additional radial projections, a flange on the other coupling member in the path traversed by said additional projections during relative approach of said coupling members, notches in said flange corresponding in number and spacing to said positions, said positions and notches being so located with respect to the main radial projections and the longitudinal guiding notches therefor that each of the positions is in circumferential register with a notch in the flange when the main radial projections are in any position in which they are in circumferential

register with the longitudinal guiding notches, and both sets of projections lie in their associated notches at one stage in the axial approach of one coupling member to the other, a ring formed with a number of notches less than the number of notches in the flange and having a spacing which is a multiple of the spacing of the notches in the flange, and means for fixing said ring to said flange in any position in which the notches therein register with notches in the flange, whereby selective positioning of the notched ring on the flange and selective positioning on the said one coupling member of a number of said additional radial projections equal to the number of notches in the ring determines the positions of the said coupling members one relative to the other in a rotational sense by which the main radial projections will pass through the longitudinal guiding notches.

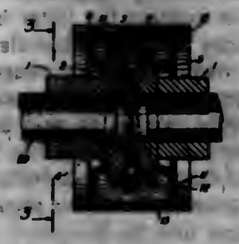
---



2,773,708
PLUMBING ASSEMBLY
Peter J. Beyerle, San Diego, Calif.
Continuation of abandoned application Serial No. 322,903, November 28, 1952. This application February 1, 1955, Serial No. 485,563
1 Claim. (Cl. 285—64)

In a plumbing assembly: a suporting strip having a longitudinal row of equidistant holes, one or more of said holes at the end portions of said strip being adapted to receive fastening elements to secure said strip to the structural members of a building; at least one tubular fitting secured to said strip, each such fitting comprising a tubular body having a plane of symmetry and having a first wall portion defining a tubular passage having an open end lying entirely to one side of said strip to receive a companion pipe and a second wall portion disposed at a substantial angle less than a straight angle to said first portion to receive a companion pipe, said first wall portion having a tangent perpendicular to said plane and having a longitudinal axis, each such fitting having a single cross-piece integral with said first wall portion but disposed radially outwardly solely on one side thereof and having a surface lying in a plane substantially normal to said axis and common to said open end, said wall portion and cross-piece of each such fitting having substantially equal thicknesses throughout, each of such cross-pieces containing spaced fastener-receiving openings penetrating said surface in an area radially completely beyond said tangent and lying on opposite sides of said plane of symmetry, said fastener-receiving openings being alignable with said strip holes; and means passing through said strip holes and the openings of each such cross-piece aligned therewith to secure said cross-piece to said strip with said first wall portion disposed laterally completely to one side of said strip, the spacing between the openings of each cross-piece being a whole number multiple of the spacing between adjacent strip holes.

---

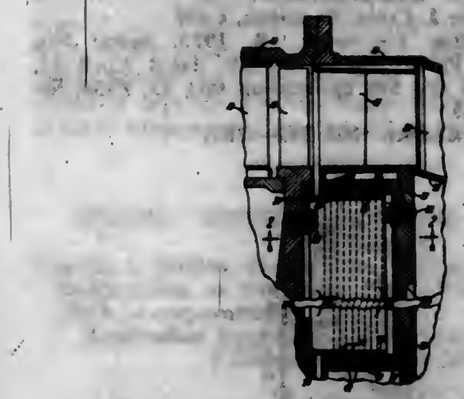


2,773,709
BIMETALLIC COUPLING FOR FLANGED PIPE ELEMENTS
Douglas Smith, South Norwalk, Conn.
Application January 11, 1956, Serial No. 558,505
4 Claims. (Cl. 285—187)

1. An exterior coupling for flanged pipe elements, the coupling comprising a band adapted to surround the two flanges and bimetallic retainers on the band having lugs near the edges of the band curled toward the middle of the band and over the inner face thereof with free legs facing toward each other adapted to press against the flanges with a component of force coaxial with the coupling, there being in each retainer inside the lug a curled piece of metal of a higher coefficient of expansion than the lug; there being an indentation on the inner face of the band in which the free leg of the two opposite retainers rests, the curled pieces of metal of higher coefficient being thereby held against movement circumferentially of the band and the retainer also being limited in retraction.

---

2,773,710
BIMETALLIC COUPLING FOR FLANGED PIPE FITTINGS
Douglas Smith, South Norwalk, Conn.
Application December 9, 1954, Serial No. 474,672
7 Claims. (Cl. 285—187)



1. An exterior coupling for joining two pipe fittings each having a flange on the end, comprising the combination of a clamping ring with means thereon adapted to tighten the ring around the pipe flanges and axially-spaced means depending from the same side of the ring adapted to bracket the two opposed flanges; at least one of said axially-spaced means including curled internal and external layered bimetallic elements adapted to be located

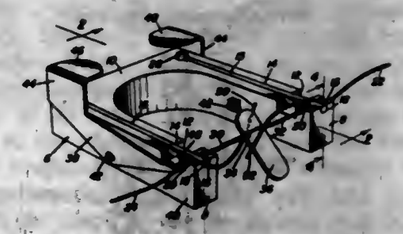
on one side of at least one of the flanges and each having one leg attached to the ring and a free leg adapted to contact the flange with the same external metal as the leg attached to the ring, the internal layer having a higher coefficient of expansion than the external layer so that upon increase in temperature the elements tend to straighten out, thereby being adapted to press tighter against the flange.

---

2,773,711
COIL SPRING FLUID PRESSURE SEAL
William S. Castle, Speedway, and Chester E. Heckert, Indianapolis, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application February 20, 1953, Serial No. 338,028
4 Claims. (Cl. 286—10)

1. A high pressure, high temperature gas seal for turbomachines and the like, said seal being entirely fashioned from heat resistant metallic material and comprising a first member having a surface of revolution provided with a thread-like groove having parallel side walls forming a plurality of axially spaced turns, a second member rotatable relatively to said first member and having a surface of revolution in concentric spaced relationship with said surface of said first member, a coil spring having a plurality of axially spaced turns slidably received in said groove for radial and rotational movement and including a rim portion protruding from said surface of said first member and resiliently bearing against the surface of said second member to form a sliding contact labyrinth seal therewith, said groove having sufficient depth to provide a space between the bottom of said groove and that peripheral surface of said coil that is located in said groove, one end of said coil being secured to said first member to prevent said coil from rotating as an entirety with said second member, said second member being relatively rotatable in a direction such that increases in frictional drag between said coil turns and the surface of said second member tend to twist said coil turns from contact therewith.

---

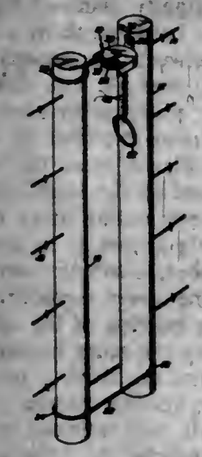


2,773,712
WINDSHIELD WIPER ARM DRIVING MEANS
Herbert I. Chambers, Toledo, Ohio
Application December 31, 1952, Serial No. 328,997
1 Claim. (Cl. 287—53)

In a device of the class described, an arm assembly for a windshield wiper blade comprising, a cup-shaped driving member interlocked in a driving relation to an oscillatable shaft, said member having a smooth conical tapering surface of approximately nine degrees concentric with the shaft, a cup-shaped driven member also having a smooth conical tapering surface of substantially the same taper adapted to nest with the driving member so that when they are tightly clamped together they form a driving connection between them solely by the frictional engagement between the smooth nesting surfaces, a laterally-extending arm on the driven member, an outer shroud member covering the elements and attached to the arm of the driven member by a pivot pin positioned at a point displaced from the axis of the shaft, a pressure nut threaded to the shaft including a depending tubular portion terminating in an externally extending flange to rotatably secure it to the driven member and the shroud member, a tubular member between the shroud member and the driven member positioned around the depending tubular portion of the nut for transferring the force for clamping the parts having the tapered surfaces together to form the driving connection between them and to hold the driving member in its interlocking relation with the shaft, and inturned spaced lugs on the shroud member to underlie the driving member to prevent complete disengagement of the driving and driven members whereby the parts are maintained as an assembly when disengaged from the shaft.

---

2,773,713
ANGLERS KNOT TYING VISE
Francis A. Smalley, Blackwell, Okla.
Application November 28, 1955, Serial No. 549,268
3 Claims. (Cl. 289—17)

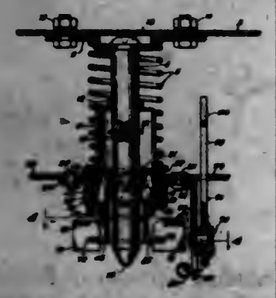


1. For use in holding portions of flexible elements, for example a fishing line and leader, and uniting the same by twisting and connecting the same by way of a barrel knot, a portable vise comprising a substantially horseshoe shaped body constituting a base and embodying spaced parallel coplanar arms and a connecting bight portion, the top surfaces of the outer ends of the arms having cooperating grooves therein, spring hold-down fingers mounted atop said arms and having free end portions cooperating with the grooves, said arms also having clearance notches inwardly of the grooves, and levers pivoted on the respective vertical sides of the arms and having finger pieces at their rearward ends and lifting lugs at their forward ends seated in said notches and cooperable with said fingers.

---

2,773,714
WIRE GATE FASTENER
Oliver D. McKinney, Loeley, Okla.
Application December 22, 1954, Serial No. 476,918
3 Claims. (Cl. 292—246)

1. The combination of a gate post adjacent a fence post with a locking device, said device comprising a pulley, a housing surrounding a major portion of the pulley, a bracket on said housing for securing the housing and pulley to the fence post in a horizontal plane, a pair of projections on said housing, said projections extending substantially tangential to said pulley thereby forming with portions of the periphery of said pulley notches adjacent opposite edges of said housing, a flexible chain on said pulley, a ring on each of the ends of said chain, one of said rings adapted to be selectively positioned over the upper end of the gate post and the other of said rings adapted to be pulled for pulling the gate post towards the



fence post said other of said rings assuming a depending relation to the housing and automatically positioning the

chain in one of said notches thereby locking the chain in adjusted position.

**2,773,715**
**HOOD LATCH**
**Adam C. Lindner, Chicago, Ill., assignor to Chicago Forging and Manufacturing Company, Chicago, Ill., a corporation of Delaware**
**Application October 22, 1954, Serial No. 463,872**
**4 Claims. (Cl. 292—252)**

1. In a latch assembly for automobiles and the like, a latch plate, an aperture in said latch plate, a skirt surrounding said aperture and extending from said latch plate in one direction, said skirt having an internal diameter substantially equal to the diameter of said aperture, a hollow cylindrical sleeve movably mounted in said aperture, the outside diameter of said sleeve being substantially equal to the inside diameter of said aperture and said skirt, said sleeve being mounted for movement paralleling its longitudinal axis, a generally frusto-conical ring having its base positioned against the opposite face of said plate from the face from which said skirt extends, means for holding said ring base against said plate surface, said ring being positioned in axial alignment with said aperture, said skirt and said sleeve, said ring having its wall converging in a direction away from said last named plate surface and supporting a portion of said sleeve, said sleeve having a plurality of apertures in said last named sleeve portion, a ball member mounted in each of said apertures in said sleeve portion, the diameter of said sleeve apertures being less than the diameter of said ball members but being sufficient to permit a portion of said ball members to extend therethrough to contact said keeper when said keeper is within said sleeve, the radius of the area of said ring at its base being greater than the combined radius of said keeper and the diameter of one of said ball members, the radius of the area within said ring at its opposite end being less than the combined radius of said keeper and diameter of one of said ball members whereby withdrawal of said keeper from said sleeve frictionally moves said ball members along said ring toward said opposite ring end to urge said balls inwardly against said keeper to prevent further withdrawal thereof, the combined radius of said sleeve and said skirt being less than the combined radius of said sleeve and the diameter of one of said ball members whereby said ball members are effective to prevent movement of said sleeve outwardly through said plate aperture and said skirt and release means for said latch assembly including a lever pivotally mounted on said latch plate and having a lost motion connection with said sleeve and means for moving said lever to urge said sleeve in a direction outwardly through said plate aperture and said skirt to move said ball members toward said plate and toward ring base.

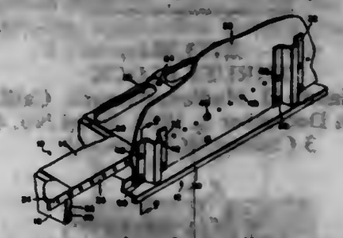
**2,773,716**
**DOOR LATCH**
**Burnie J. Craig, Pasadena, Calif.**
**Original application December 18, 1950, Serial No. 201,284, now Patent No. 2,706,129, dated April 12, 1955. Divided and this application July 13, 1954, Serial No. 443,013**
**2 Claims. (Cl. 292—280)**

1. In a door lock, a base, a bolt pivoted on the base, a ratchet fixed rigidly on the bolt, pivotally mounted holding means engaging the ratchet and normally preventing release of the bolt, a movable operating member, an actuating member operable by said operating member, means to mount the actuating member for movement either to a locked position or to an unlocked position and for movement to and from a bolt releasing position, means to releasably maintain the actuating member in locked or in unlocked position, said operating member being movable at all times to move the actuating member, a substantially L-shaped dog pivoted on the base, said dog including one end portion engageable with the holding means for rocking the holding means to bolt releasing position, said dog including another end portion engageable with the actuating member when the actuating member is moved while it is in unlocked position, said other dog end portion being out of engagement with the actuating member when the actuating member is moved while it is in locked position, inside means to move said actuating member to and from locked position, and restoring means including a shoulder on said holding means and a coacting shoulder on said actuating member, said shoulders being engageable and operable by movement of the bolt ratchet upon a closing movement of the door, when the actuating member is in locked position, and the actuating member is also in non-releasing position to move said actuating member to unlocked position.

---

**2,773,717**
**VEHICLE DOORLOCK STRIKE**
**Burnie J. Craig, Los Angeles, Calif.**
**Original application December 18, 1950, Serial No. 201,281, now Patent No. 2,705,882, dated April 12, 1955. Divided and this application March 7, 1955, Serial No. 492,610**
**2 Claims. (Cl. 292—340)**

1. In a door lock strike, a body adapted to be secured upon a vehicle, said body having upper and lower edges and including spaced bolt engaging teeth projecting from one edge thereof, said body having two planar surfaces



extending perpendicular to each other and disposed adjacent to the other edge thereof and in spaced opposed vertical relation to the teeth, a dovetail wedge having two planar portions extending perpendicular to each and engaging said planar body surfaces and slidable therealong, means on the body to constrain the dovetail wedge to

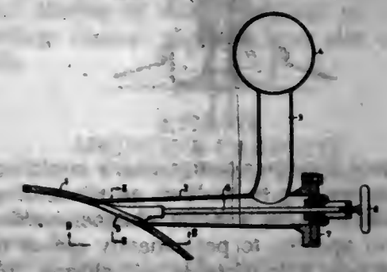
move linearly along the said planar surfaces, means to prevent lateral movement of the dovetail wedge on the body, said dovetail wedge having a recess, a spring in said recess and engaging the adjacent wall of the strike to normally urge the dovetail wedge forwardly, and means to limit movement of the dovetail wedge by the spring.

---

**2,773,718**
**FLOOR CONSTRUCTION WITH INTEGRAL CROSS-SILLS**
**Charles L. Bohlen, Doylestown, Pa., assignor, by mesne assignments, to Fruehauf Trailer Company, Detroit, Mich., a corporation of Michigan**
**Application August 20, 1953, Serial No. 375,449**
**4 Claims. (Cl. 296—28)**

1. A floor construction for trailers comprising a plurality of transverse sections, each section being generally L-shaped and including a depending cross-sill integral with a horizontally extending plate, said horizontal plate having a transverse depressed area at its juncture with the cross-sill at least equal in depth to the thickness of the horizontal plate, means joining the free end of one horizontal plate to an adjacent horizontal plate at the depressed area to provide a substantially flat floor surface, and means connecting the ends of the sections to the sides of the trailer, said last-named means including flanges depending from the ends of the horizontal plates and flanges upstanding from the ends of the cross-sills and means securing said flanges to the sides of the trailer.

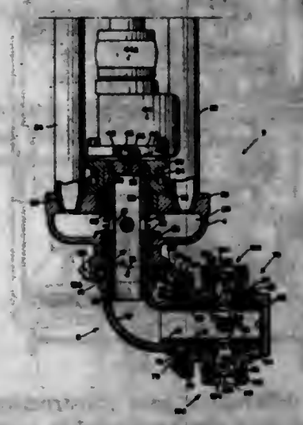
---



**2,773,719**
**REAR FENDER COMPARTMENT FOR SPARE TIRE**
**Brooks Walker, Piedmont, Calif.**
**Application October 11, 1952, Serial No. 314,265**
**7 Claims. (Cl. 296—37.2)**

2. A vehicle having a body, rear wheels, a portion of said body covering one said rear wheel and forming a compartment in back of said rear wheel, said compartment adapted to carry a spare wheel substantially vertically and substantially in line with said one rear wheel, access to said compartment being from under said compartment, manually operated means to raise said spare wheel into said compartment from below, manually adjustable means for holding said spare wheel in a raised position within said compartment.

---



**2,773,720**
**STEAM VALVE WITH CLEANING FEATURE**
**Carl Kristian Filip Palm and Erik Herbert Nyléf, Norrsundet, Sweden, assignors to Kopparfors Aktiebolag, Ockelbo, Sweden, a corporation of Sweden**
**Application June 23, 1953, Serial No. 363,520**
**Claims priority, application Sweden July 1, 1952**
**2 Claims. (Cl. 299—59)**

1. For use with an evaporator for waste cellulose lye having a cylindrical wall, a steam valve for supplying superheated steam to the interior of said evaporator, said valve comprising an elongated substantially cylindrical body portion adapted to merge with the wall of the evaporator at an oblique angle to communicate with an opening in the evaporator wall corresponding in cross-section to the cross-section of said body portion, a rotatable spindle extending axially through said body portion, and a valve member carried at the end of said spindle, said valve member having the form of an elliptical disk secured at its center to the spindle at an oblique angle equal to the oblique angle between the body portion and the evaporator wall, said disk normally lying in a position substantially coinciding with and smoothly merging with the plane of the evaporator wall but being dimensioned to leave a small clearance with respect to the wall of the body portion for peripheral admission of the steam and being movable into a position in which the steam sweeps the sides of the disk.

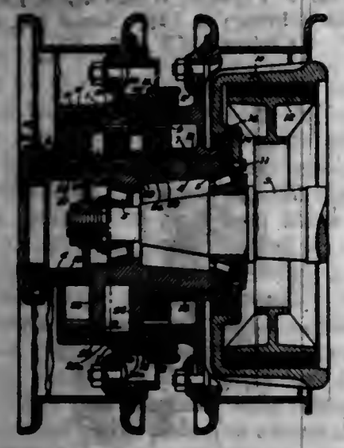
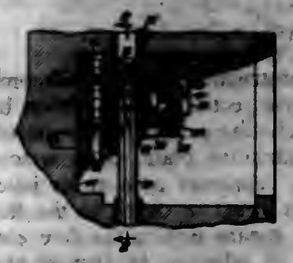
**2,773,721**
**TANK WASHING APPARATUS**
**Irenee P. Pedrick, Wynnewood, Pa.**
**Application February 8, 1955, Serial No. 486,825**
**6 Claims. (Cl. 299—62)**

1. Tank washing apparatus comprising a support, a conduit carried by said support and mounted for rotation, means to rotate said conduit, a spray head mounted for rotation on said conduit on an axis substantially at right angles to the axis of rotation of the conduit, a nozzle on said spray head lying in a plane substantially perpendicular to the axis of rotation of the spray head, said spray head having a resilient collar, key means mounted on said



support and adapted to intermittently engage said collar to index said spray head on its axis a predetermined amount for each 360° of rotation of said conduit.

2,773,722
AEROSOL DISPENSER
Robert H. Abplanalp, Bronx, N. Y., assignor, by direct and mesne assignments, of one-half to John J. Baessler, Yonkers, N. Y.
Application March 2, 1955, Serial No. 491,566
3 Claims. (Cl. 299—95)



1. An aerosol dispenser comprising: a container closure cup having an opening in its base, an upstanding tubular outlet provided with an annular channel embracing the margin of said opening to permanently mount the outlet rigidly on the cup, a disruptable seal closing the passage through the tubular outlet intermediate the ends of the latter, an external bead on the tubular outlet near the free end thereof, and a push button permanently mounted on said outlet and having a skirt closely embracing the outlet below the bead and undercut to house the bead and permit axial movement of the push button relative to the tubular outlet, said push button being provided with a plunger extending into the passage of the outlet and adapted to disrupt the seal therein when the push button is pressed to permit the passage of liquid from an associated container through a discharge duct formed in the push button.

2,773,723
BRAKING ARRANGEMENT FOR DUAL WHEELS WITH NON-TORQUE-EQUALIZING DIFFERENTIAL MEANS
Ralph R. Randall, Freeport, Ill., assignor, by mesne assignments, to Dunlop Engineering Co., Rockford, Ill., a corporation of Illinois
Continuation of abandoned application Serial No. 48,217, September 8, 1948. This application July 31, 1953, Serial No. 371,582
1 Claim. (Cl. 301—6)

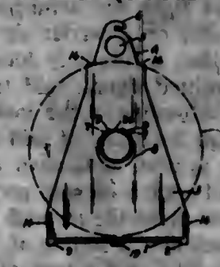
A dual wheel differential gear construction comprising an axle, a tubular gear carrier rotatably mounted on said axle, brake means carried by said gear carrier for controlling the rotation of said gear carrier, an annular bearing bushing mounted on the outer surface of said gear carrier at each end thereof, said gear carrier having a pair of annular spaced flanges centrally located on the outside surface thereof, a pair of wheel elements each having a flanged hub and a cylindrical housing, said annular bearing bushings supporting said flanged hubs, one of said cylindrical housings encircling one of said spaced flanges and the other of said cylindrical housings encircling the other of said spaced flanges, bearing sleeve means mounted on the periphery of said flanges and supporting said cylindrical housings, one of said cylindrical housings projecting beyond its respective encircled flange and encircling the other of said spaced flanges and projecting over and encircling the end of the other of said cylindrical housings, a bearing sleeve mounted on the end of the other of said cylindrical housings and supporting the projection of the said one of said cylindrical housings, a non-torque equalizing transmission acting between said gear carrier and said wheel elements and carried by said annular spaced flanges, said transmission comprising a pair of internal spur gear elements rotatable with said wheel elements, a second pair of spur gear elements meshing with said first pair of gear elements, an externally screw-threaded shaft rotatable with one of said second pair of spur gear elements, an internally-threaded spur gear element having a threading movement on said shaft, a spur gear element meshing with said internally-threaded spur gear element and rotatable with the other one of said second pair of spur gear elements, and means including said flanges for limiting the threading movement of said internally-threaded gear element on said threaded shaft whereby to bind said threaded gear element and said threaded shaft to said gear carrier comprising a bearing element between the threaded gear element and the flanges engaged by said threaded gear element in its threaded movement in either direction.

2,773,724
THRUST BLOCK
Benjamin H. Hadley, Pomona, Calif.
Application December 2, 1954, Serial No. 472,719
3 Claims. (Cl. 308—1)

1. In a thrust block for a rotatable and reciprocable spindle, the combination of: a body member having a cylindrical chamber extending partially therethrough from one side thereof and adapted to receive an end of the spindle, said body member also having a lateral opening extending partially therethrough and intersecting said chamber, said body member also having a bore axially aligned with and connecting with said chamber; a first thrust washer in said chamber; a second thrust washer in said opening; first external means for partially closing the open end of said chamber at said one side and retaining said first thrust washer in said chamber; and second external means for retaining said second thrust washer in said opening.

2,773,725
WORK TABLES FOR BORING MILLS AND THE LIKE
Roland R. Roberts, Irondequoit, N. Y., assignor, by mesne assignments, to Farrel-Birmingham Company, Incorporated, Ansonia, Conn., a corporation of Connecticut
Application October 14, 1953, Serial No. 386,047
8 Claims. (Cl. 308—77)

2. In a machine tool, a bed, a work table rotatably mounted on said bed, and a plain bearing disposed between said table and said bed and secured to one of these two parts to engage the other part to take axial thrust, said plain bearing comprising a plurality of sector plates concentric to the axis of said table, each of said plates being spaced angularly slightly from the adjacent plates to permit expansion, means for securing each plate to said one part against movement radially of said axis, said plates being mounted to be free to have limited movement for expansion angularly about said axis, each of said plates being provided with undulatory grooves on its

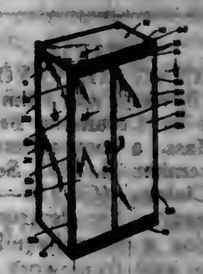


opposite side faces, the grooves on one side of each plate having their undulations reversed with reference to the grooves on the opposite side of each plate, means for supplying high pressure lubricant to the set of grooves in the face which engages said other part, and means for supplying a low pressure coolant in high volume to the grooves in the other face, each of said plates being made of a metal alloy containing a metal having lubricating qualities.

2,773,726
BORDERED TABLE TOPS, PARTICULARLY FOR CAMPING TABLES
Ebbe Anders Isrnel Johansson and Sture Allan Mattias Johansson, Halmstad, Sweden
Application April 11, 1955, Serial No. 500,493
Claims priority, application Sweden May 4, 1955
2 Claims. (Cl. 311—107)

1. A table top with a border frame comprising a rectangular shaped panel, means providing at least two series of projections on said panel with each series extending substantially parallel to, but spaced from one of oppositely situated edges of said panel, a pair of frame members each having a channel-shaped cross-sectional configuration and a constricted longitudinal opening along the length thereof with the marginal portion of said panel slidably extending therethrough, said frame members each having a configuration corresponding to a portion of the perimeter of said panel with said frame members encasing the marginal portions of said panel and said projections for being retained from lateral movement from said panel by said projections.

2,773,727
RECORD HOLDER
William T. Bradley, Philadelphia, Pa.
Application April 27, 1953, Serial No. 351,329
5 Claims. (Cl. 312—10)



1. A disk-recordings support, carrying, and storing device comprising a horizontally extending rectangular base member, a vertically extending support member fixedly attached to said base member along the long axis of said base member, horizontally extending tubular disk-recordings support members fixedly attached to said vertically extending support member and extending to each side thereof and being adapted to support a multiplicity of vertically positioned disk-recordings, an upwardly extending rib on the upper outer end of said tubular disk-recordings support member and a bevel on the lower outer end of said tubular disk-recording support members, said bevel being adapted to permit vertical movement of said disk recordings in space relationship to said tubular disk recordings support members for ready removal and placing of disk recordings on said tubular disk-recordings support members over said vertically extending rib.

2,773,728
MEDICINE CABINETS
Dwight La Barre, Pontiac, Mich., assignor, by mesne assignments, to Orans & La Barre, Centerline, Mich., a partnership, composed of Dwight La Barre and William L. Dayner, Sr.
Application December 17, 1949, Serial No. 133,585
6 Claims. (Cl. 312—227)

5. A medicine cabinet mounted in a wall substantially at eye level and comprising a cabinet structure and a door structure therefor, said door structure having a pair of angularly disposed front panel structures, angularly disposed mirrored panel sections respectively secured to each of said front panel structures and constructed to abut end to end along a horizontal line substantially medially of the top and bottom edges of said door structure, the apex of said angularly disposed mirrored panel sections extending in a horizontal plane located below the eye level of an average adult and above the eye level of an average child when said medicine cabinet door structure is closed.

2,773,729
KNOCKDOWN SHEET METAL WARDROBES
Sam Dorman, South Orange, N. J.
Application February 5, 1954, Serial No. 408,376
7 Claims. (Cl. 312—257)

1. A knockdown sheet metal wardrobe of the character described, comprising a door frame section, a back and side wall section and top and bottom wall sections, the back wall having hollow posts extending longitudinally and forwardly of opposed side edges thereof, means

on said posts and adjacent edge portions of the side walls for hingedly coupling the side walls with said posts to collapse upon said back wall, the door frame section having, longitudinally of side edges thereof, hollow side posts joined by top and bottom rails, said posts having longitudinal slots on inner walls thereof inwardly of outer side walls of said posts, forward edge portions of the side walls being slidable longitudinally of the slots in assembling the door frame section therewith, said forward edge portions of the side walls having flanges engaging the posts of the door frame section in firm support of the side walls in said door frame posts, said top and bottom wall sections having recessed walls bordered by back and side hollow rails, said rails including means to frictionally engage upper and lower edge portions of said back and side walls, and means at the forward edge portion of the recessed wall of said top and bottom sections operatively engaging the top and bottom rails of the door frame section in retaining the top and bottom sections in positions on said back and side walls.

## PREPARATION OF LIGHT SENSITIVE SURFACES

Gerhard Lewin, West Orange, N. J., assignor to Tung-Sol Electric Inc., Newark, N. J., a corporation of Delaware

Application December 17, 1953, Serial No. 398,695
9 Claims. (Cl. 316—8)

1. The method of forming on an element a surface layer of cesium antimonide which comprises depositing on the element a layer of antimony to be combined with cesium, mounting the element in an enclosure having a reservoir communicating therewith, degasifying the element by vacuum baking, then introducing cesium vapor into the enclosure for formation of the antimonide, heating the reservoir to one temperature and the element to a higher temperature to maintain the pressure of the cesium vapor less than the equilibrium pressures of cesium vapor and liquid at such temperatures but above the dissociation pressure of cesium antimonide at the higher temperature whereby excess cesium is collected in the reservoir, cooling the element and the reservoir and finally isolating the enclosure from the reservoir.

## AGING CONVEYOR

Russell W. Chick, Beverly, and John C. Silva, Peabody, Mass., assignors to Columbia Broadcasting System, Inc., Danvers, Mass., a corporation of New York

Application November 12, 1952, Serial No. 320,004
3 Claims. (Cl. 316—27)

1. An aging conveyor for electron tubes comprising, a framework defining a generally elliptical closed path, a track mounted on said framework, a plurality of carrier members movable along said track, said carrier members being flexibly interlinked to form an endless chain, means for indexing said carrier members a predetermined distance about said path periodically, a plurality of detachable chassis, each having a number of tube sockets, one of said chassis being mounted on each of said carriers, a plurality of segmented bus strips arranged about the periphery of said framework, a plurality of power supplies, each being connected to a segment of said bus strips, a plurality of contactors mounted on each

of said chassis, said contactors being resiliently urged against said bus strips, and means connecting each of said contactors to similar elements of tubes in said sockets.

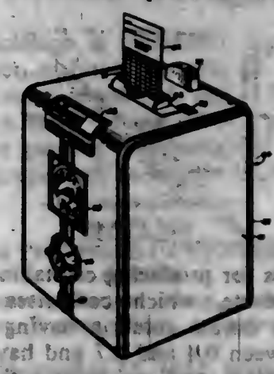
2,773,732

## FIRING ERROR RECORDER

Richard B. Roberts, Washington, D. C., and Robert P. Petersen and Clyde T. Holliday, Silver Spring, Md., assignors to the United States of America as represented by the Secretary of the Navy

Application September 13, 1946, Serial No. 696,926
1 Claim. (Cl. 346—38)

Apparatus for recording the position of a projectile with respect to a target at substantially the time of closest approach to each other and simultaneously recording the range of said target measured from the source of the projectile, comprising, a motion-picture camera located near said source of said projectile and mounted to photograph said target and its immediate surroundings including said projectile, a radio transmitter positioned in said target, said transmitter having electrically associated therewith an acoustically-sensitive device, means for actuating said device by a shock wave created by said projectile while in aerial flight and arranged to generate an audio signal impressible on a carrier signal and transmitted by said transmitter, a remotely located receiver for receiving said transmitted signal, said transmitted signal being indicative of substantially the instant of transit of said projectile through the plane of said target, means for providing a visible symbol indicative of the range of said target from said source of said projectile at the instant of transit of said projectile through the plane of said target, and means including a source of light controllable by said signal received by said receiver to illuminate said symbol, means whereby said camera will produce a photographic record showing simultaneously the range of said target from said source of said projectile as shown by said symbol at said instant of transit of said projectile through the plane of said target, and the position of said projectile at the time of closest approach to each other of said target and projectile.

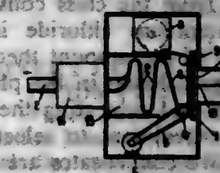


2,773,733

## WORKMEN'S IN-AND-OUT RECORDER

Richard L. Lorenz, Chicago, Ill., assignor to General Time Corporation, New York, N. Y., a corporation of Delaware

Application April 17, 1953, Serial No. 349,419
59 Claims. (Cl. 346—84)



1. In a recorder for use with a direct voltage supply producing periodic impulses of short duration and limited in magnitude by the current-carrying capacity of the supply, the combination comprising a magnetic solenoid connected to said supply, a timing shaft having a driving connection with said solenoid for step-by-step rotation of the shaft, a program unit and type unit coupled to said timing shaft for rotation in unison therewith, means including shift and lift mechanisms of stepping type for positioning an inserted card horizontally and vertically relative to said type unit, means including a storage spring for storing a portion of the energy released by said solenoid, said spring being coupled to the shift and lift mechanism, means including latches arranged for triggering by said program unit at predetermined times for causing stepping of said shift and lift mechanisms by energy stored in said spring, and magnetic means arranged for connection to an A. C. supply line for applying a printing impulse to the card as an incident to bottoming of the same in the recorder.

2,773,734

## TIME RECORDING APPARATUS

Turulf Normann, Gjovik, Norway, assignor to Omega Louis Brandt & Frere S. A., Bienne, Switzerland

Application March 22, 1954, Serial No. 417,796
Claims priority, application Switzerland April 16, 1953
5 Claims. (Cl. 346—107)

1. A precision photographic time recording device accurate to one-tenth of a second comprising a camera adapted to receive a strip of film, film advancing means for the camera, start and stop means for the film advancing means, shadow producing means adapted to produce a shadow line formed of collinear straight line segments separated by projections for providing indications of timed intervals on film in the camera, including an electromagnet, an armature for the electromagnet, a stretched wire having one end attached to the armature, slotted means interposed between the wire and the film, chronograph time indicating means, a flyback hand and a sweep second hand for the chronograph, electrically operated start and stop means for the chronograph, electrically operated stop means for the flyback hand, a geared wheel for the chronograph, at least one pin on the geared wheel, first intermittent electric contact making means actuable by the pin on the wheel of the chronograph for controlling the electromagnet of the shadow producing means, second intermittent electric contact means actuable by the pin on the wheel of the chronograph for controlling the starting position of the first intermittent contact making means, the electrically operated starting means operable to start the chronograph at the beginning of the timed interval and the film advancing means manually started thereafter, double contact switch means including first and second contacts, the first contact of the double contact switch energizing the shadow producing electromagnet circuit, the second contact of the double contact switch energizing the flyback stop means, whereby the elapsed time is given by the combined reading of the chronograph and the projections of the shadow line on the film, the double contact switch stopping the flyback hand and simultaneously starting the shadow producing means for the indication on the film.

## EXHAUST GAS CONDITIONING METHOD

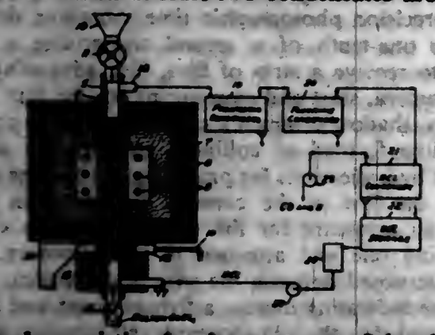
Joseph P. Ruth, Denver, Colo.

Application July 27, 1953, Serial No. 370,455
5 Claims. (Cl. 23—2)

1. The method of conditioning internal combustion engine exhaust gases to non-hazardous and unobnoxious form free from entrained solids and acidic constituents which consists of flowing the gases under the influence of their discharge pressures through an intersticed diffusing medium inert with respect to the gases and gas-water mixtures thereof, feeding an alkalized water solution to the gas flow with resultant generation and entrainment of a gas-liquid mixture, and directing solution and gas-liquid mixtures entrained with the gas flow to and with sustained wetting effect upon said diffusing medium as an incident of and in direct reaction to such flow, whereby to maintain alkalized solution dispersed for intimate contact with the gases in the path of gas flow through said medium.

---

2,773,736



## TREATMENT OF PHOSPHATE ROCK TO RECOVER PHOSPHORUS, FLUORINE, CALCIUM, AND URANIUM

Clinton A. Hollingsworth, Lakeland, Fla., assignor to Smith-Douglass Company, Incorporated, Norfolk, Va., a corporation of Virginia

Application August 8, 1952, Serial No. 303,270
5 Claims. (Cl. 23—14.5)

1. The method of recovering values from a natural phosphatic material containing recoverable amounts of

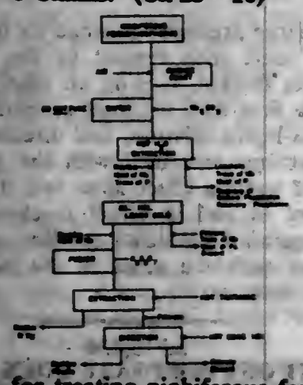
phosphorus, fluorine and calcium which comprises preparing an intimate mixture consisting essentially of said material and at least 10% by weight of a carbonaceous material, subjecting said mixture to heat-treatment for a period not exceeding 90 minutes at a temperature within the range of 2000 to about 2400° F. in a chlorine-containing atmosphere selected from the class consisting of hydrogen chloride and ammonium chloride in which chlorine is present in excess of the amount theoretically required to convert all of the calcium in the phosphatic material to calcium chloride, and subjecting the gaseous reaction product of the heat-treatment to selective condensation in which at least two condensates are obtained

respectively consisting for the most part of the phosphorus and fluorine contents of said gaseous reaction product, the non-volatile residue of said heat-treatment containing most of the calcium originally present in the phosphatic material in the form of molten calcium chloride.

2. The method of claim 1 in which the molten calcium chloride is separated from the unfused solid matter of the non-volatile residue of the heat-treatment.

3. The method of claim 2 in which the natural phosphatic material additionally contains a recoverable amount of uranium, and recovering such uranium with the calcium chloride separated from the non-volatile residue of the heat-treatment.

### ERRATUM



For Class 23—59 see:
Patent No. 2,774,070

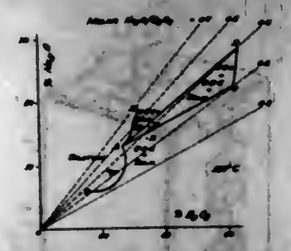
### 2,773,737

### CHEMICAL PROCESS FOR RECOVERING NIOBIUM VALUES FROM NIOBIFEROUS FERROPHOSPHORUS

Morris L. Nielsen, Centerville, and Larry K. Duncan, Dayton, Ohio, assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

Application November 24, 1953, Serial No. 394,134
3 Claims. (Cl. 23—16)

1. A process for treating niobiferous ferrophosphorus and recovery of niobium values therefrom, which comprises roasting said ferrophosphorus in air, mixing the roasted product with soda ash, heating the mixture to a temperature only sufficient to sinter the mixture, leaching the sinter with hot water, further leaching the residue with hydrochloric acid to remove iron therefrom, fusing the residue with sodium pyrosulfate, extracting the fused product with hot tartaric acid, treating the resulting niobium-tartrate complex with hot concentrated hydrochloric acid and recovering niobium values therefrom.



### 2,773,738

### NEW CRYSTALLINE SODIUM BORATE AND METHOD FOR PRODUCING THE SAME

Geoffrey R. Ball, Belvedere, and Peter H. Kemp, London, England, assignors, by mesne assignments, to United States Borax & Chemical Corporation

Application August 24, 1953, Serial No. 376,198
Claims priority, application Great Britain August 27, 1952
6 Claims. (Cl. 23—69)

1. Crystalline sodium tetraborate monohydrate, $Na_2B_4O_7 \cdot H_2O$.

2. The process for producing crystalline sodium tetraborate monohydrate, which comprises producing an aqueous sodium borate solution having a molar ratio $Na_2O/B_2O_3$ between 0.4 and 0.7 and having a predetermined water content, and maintaining the solution at a temperature above about 115° C. to deposit from the solution crystals of sodium tetraborate monohydrate, the said water content of the solution being insufficient to maintain all the borate in solution at the said temperature, and the said molar ratio having a value that is within the said range and is sufficiently high to prevent precipitation of $2Na_2O \cdot 5B_2O_3 \cdot 5O_2$ at the said temperature and water content.

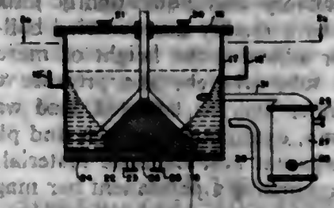
### 2,773,739

### METHOD OF OBTAINING SODIUM BICARBONATE

Ward J. Burkholder, Houston, Tex., assignor to Diamond Alkali Company, Cleveland, Ohio, a corporation of Delaware

No Drawing. Application January 30, 1953, Serial No. 334,359
13 Claims. (Cl. 23—66)

1. The method of obtaining sodium bicarbonate crystals of a size and quality comparable to those normally obtained in operation of the ammonia-soda process, which includes the step of carbonating sodium chloride brine in the presence of an amine having a boiling point at atmospheric pressure of between 100° and 360° C. and having the formula $NR_1R_2R_3$, wherein $R_1R_2$ and $R_3$ are substituents selected from the group consisting of hydrogen, alkyl containing from 2 to 6 carbon atoms, alkanols containing from 2 to 4 carbon atoms, and primary aminoalkyl containing from 2 to 4 carbon atoms, and where no more than two of $R_1$, $R_2$ and $R_3$ are hydrogen, at an elevated temperature and under pressure.



### 2,773,740

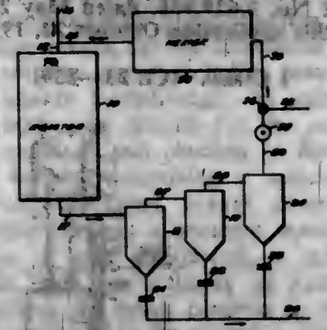
### PROCESS AND APPARATUS FOR THE CONTINUOUS PRODUCTION OF AQUEOUS SOLUTIONS OF SODIUM HYDROSULFITE FROM SODIUM AMALGAM AND GASEOUS $SO_2$

Arnoldo Battarra, deceased, late of Milan, Italy, by Marie Elisa Battarra, heir and guardian of heirs, Alberto Battarra, heir, Dino Maveri, Alfonso Mellone, and Luigi Frigeri, all of Milan, Italy, assignors to Montecatini, Societa Generale per l'Industria Mineraria e Chimica, a corporation of Italy

Application March 19, 1953, Serial No. 343,334
Claims priority, application Italy March 21, 1952
7 Claims. (Cl. 23—116)

5. The process of producing an aqueous solution of sodium hydrosulfite which comprises reacting an aqueous buffer solution of sodium sulfite and bisulfite with sodium amalgam and gaseous $SO_2$ on distinct and separate contact surfaces in rapid relative movement, the contact surface between said solution and said sodium amalgam being that of a circular peripheral ring and the contact surface between said solution and said gaseous $SO_2$ being that of a frustum of a rotation paraboloid,

whereby said solution is intensively circulated between said two contact surfaces, the pH of the medium is maintained between about 5.4 and 5.8 and the temperature between about 10 and 25° C., preferably above 15° C., and the gaseous $SO_2$ being fed in substantially stoichiometric proportion in respect to sodium.



### 2,773,741

### PROCESS FOR THE PRODUCTION OF ALUMINUM OXIDE

Randolph Antonsen, Boston, Mass., assignor to Godfrey L. Cabot, Inc., Boston, Mass., a corporation of Massachusetts

Application November 25, 1952, Serial No. 322,526
1 Claim. (Cl. 23—142)

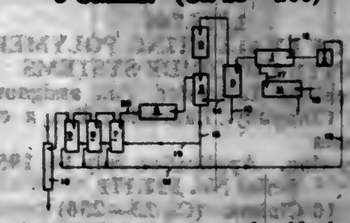
A process for producing aluminum oxide and gaseous oxides of sulfur from aluminum sulfate which comprises suspending solid particulate aluminum sulfate in the absence of free moisture in a stream of recycle reaction product gases heated to above the decomposition temperature of the aluminum sulfate, conducting the suspension through an externally heated zone, decomposing the aluminum sulfate therein to gaseous oxides of sulfur and solid particulate aluminum oxide suspended therein, the decomposing step being carried out in a zone free of contamination of combustion products, conducting the gases and suspended aluminum oxide, while maintaining said suspension at a temperature above aluminum sulfate recombination temperature, to a cyclonic separation zone, separating the aluminum oxide from the gases therein, withdrawing a portion of the gases from the system, heating the remaining portion of the gases to above the aluminum sulfate decomposition temperature and recycling said heated gases to said externally heated zone as a carrier and decomposition medium for fresh aluminum sulfate.

### 2,773,742

### PREPARATION OF COMPLEX HYDROXIDES OF PLATINUM AND PALLADIUM

James E. Connor, Jr., Drexel Hill, Pa., assignor to The Atlantic Refining Company, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application June 2, 1954, Serial No. 434,961
11 Claims. (Cl. 23—183)



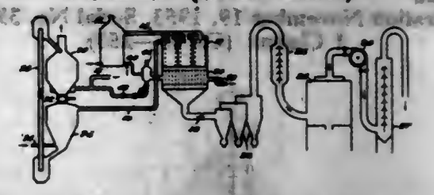
1. A method of producing complex metal hydroxides selected from the group consisting of complex platinum hydroxides and complex palladium hydroxides in which the metal is in the cation in aqueous solution which comprises passing an aqueous solution of the corresponding complex metal salt selected from the group consisting of complex platinum salts and complex palladium salts over an anion exchange resin, the resin being in the hydroxyl cycle.

### 2,773,743

### RECOVERY OF SULFURIC ACID AND IRON OXIDE FROM IRON SULFATE

Walter Fackert, Neurlield, Germany

Application September 17, 1953, Serial No. 380,818
Claims priority, application Germany September 17, 1952
6 Claims. (Cl. 23—200)



1. A process for the recovery of sulfuric acid and iron oxide from ferrous sulfate, which comprises passing steam through the ferrous sulfate at a temperature above 600° C. but not substantially in excess of about 800° C. in the absence of air and in the presence of an oxidizing agent selected from the group consisting of nitric acid, barium peroxide and potassium chlorate.

### 2,773,744

### CONTINUOUS THERMAL PROCESS OF MAKING CARBON BLACK

Randolph Antonsen, Boston, Mass., assignor to Godfrey L. Cabot, Inc., Boston, Mass., a corporation of Massachusetts

Application March 28, 1952, Serial No. 279,046
5 Claims. (Cl. 23—209.4)

1. A process for producing carbon black and gases composed substantially of hydrogen which comprises the steps of continuously flowing into an unobstructed heat-insulated reaction zone a stream of hydrocarbon gas, heating outside the reaction zone and without dilution an essentially hydrogen gas previously produced in the process to above dissociation temperature of the hydrocarbon gas, flowing the hot hydrogen gas into the reaction zone, thermally dissociating the hydrocarbon gas to carbon black and hydrogen by heat transfer from the hot hydrogen gas, separating the carbon black from said gases produced into the dissociation reaction, externally heating a portion of said thus obtained gases to hydrocarbon dissociation temperature, and recycling said gases to the reaction zone for reaction with additional hydrocarbon gas.

### 2,773,745

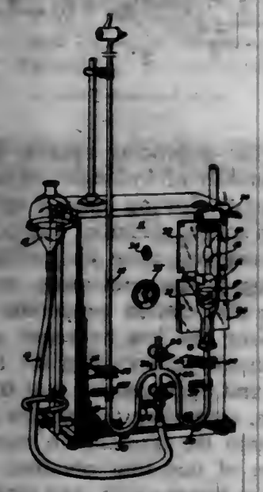
### PROCESS FOR THE PRODUCTION OF PURE SILICON IN A COARSE CRYSTALLINE FORM

Keith Hazelle Butler, Marblehead, Mass., and Carl Marcus Olson, Newark, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application July 20, 1954, Serial No. 444,655
10 Claims. (Cl. 23—223.5)

1. A process for the production of pure 99.98+% silicon in a coarse crystalline and loosely coherent form

which comprises mixing a separately heated, vaporous stream of a reducing metal selected from the group consisting of zinc and cadmium at substantial reaction temperature with a vaporous separately heated stream of a tetrahalide of silicon selected from the group consisting of a chloride and bromide, also at a reaction temperature within a silica reaction chamber, the walls of which are maintained at a temperature above the dew point of the reducing metal and of the dihalide salt by-product of said reducing metal formed in the process but not in excess of a temperature of 1100° C., and recovering the pure crystalline silicon product which results.

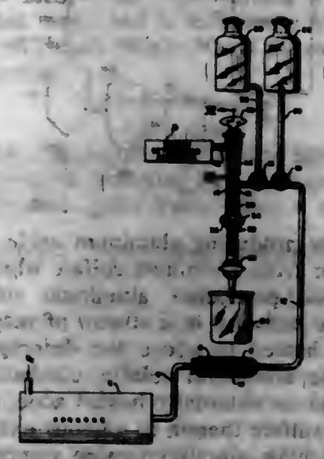


---

**2,773,746**
**METHOD OF EVALUATING POLYMERIZED VINYL CHLORIDE SYSTEMS**
Harold A. Roebling, Lancaster, Pa., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania
No Drawing. Application July 14, 1955, Serial No. 522,171
10 Claims. (Cl. 23—230)

1. The method of testing the stability against heat and light degradation of a resinous system containing as an ingredient thereof a polymerized vinyl chloride, which method comprises incorporating ultramarine blue in said system, exposing the resulting mixture to degradation conditions, and estimating the degree of stability of the system by the color change of the exposed mixture.

---

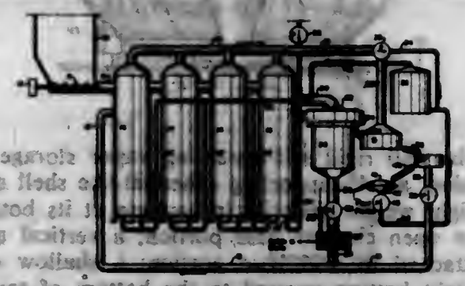


**2,773,747**
**MANOMETRIC APPARATUS FOR DETERMINING THE GAS CONTENT OF LIQUIDS**
Duncan B. King, Wayne, and Joseph A. McNelly, Plymouth Meeting, Pa., assignors to Arthur H. Thomas Company, Philadelphia, Pa., a corporation of Pennsylvania
Application November 19, 1953, Serial No. 393,181
1 Claim. (Cl. 23—253)

A manometric apparatus for ascertaining the gas content of a liquid of the Van Slyke type including in combination a casing, an extraction chamber, a gas measuring pipette extending upwardly from said extraction chamber, stop cock means at the upper extremity of said gas measuring pipette, means defining a jacket around said extraction chamber and gas measuring pipette for maintaining the same at a substantially constant temperature, a spring clip mounted to said casing, said spring clip resiliently operatively grasping said jacket means whereby said extraction chamber is retained in vertical disposition, a graduated tube for a column of mercury vertically mounted in respect to said casing, a connecting tube beneath said extraction chamber and graduated tube, spring clip means secured to said casing and resiliently operatively grasping said connecting tube and maintaining it in operative alignment and in liquid communication in respect to said extraction chamber and said graduated tube, said connecting tube being operatively and liquid-tightly joined to said extraction chamber by a readily disassembled ball-and-socket joint and operatively and liquid-tightly joined to said graduated tube by a readily disassembled ball-and-socket joint, means for adjusting the height of mercury within said graduated tube whereby the pressure within said extraction chamber may be adjusted, said water jacket, graduated column, extracting chamber, and pipette being formed of transparent non-magnetic material, a magnetized element comprising a permanent bar magnet having an inert coating, said magnetized element being disposed within the extraction chamber, a motor mounted within said casing with its rotary shaft extending into proximity to said extraction chamber, and a permanent magnet mounted on said shaft operable upon rotation of said shaft to create a rotating magnetic field to act upon said magnetized element and effect rotation of the latter within the extraction chamber whereby liquid within the extraction chamber may be agitated.

---

**2,773,748**
**APPARATUS FOR DETERMINING SULPHUR**
Charles B. Francis, Pittsburgh, Pa.
Original application February 9, 1950, Serial No. 143,654, now Patent No. 2,639,968, dated May 26, 1953. Divided and this application October 22, 1952, Serial No. 316,223
1 Claim. (Cl. 23—259)



Apparatus for absorbing in a liquid a gas from a mixture of gases comprising an elongated vessel, the top section of said vessel having two outlets, a three-way stop cock in said top section for controlling flow of gas to said outlets, said three-way stop cock being movable to one position to prevent escape of gas from said vessel and to another position to permit flow of unabsorbed gases therefrom, the bottom section of said vessel having an opening therein, a stop cock in said bottom section, said last named stop cock being movable to one position to close said opening and to another position to permit flow of liquid therefrom, a gas dispersing tube in said vessel, said tube having a bulbous portion intermediate its ends with openings therein, the bottom of said tube being open and extending to a point above the last named stop cock, and the top of said tube extending through the wall of said vessel below the top thereof, said tube adapted to be connected to said mixture of gases, a second three-way stock cock, a third three-way stop cock, said second and third three-way stop cocks being positioned in the portion of said tube outside said vessel, a reservoir adapted to contain gas absorbing liquid, a reservoir adapted to contain a rinsing liquid, a connection between

the second three-way stop cock and the first named reservoir, and a connection between the third three-way stop cock and the last named reservoir, said second three-way stop cock being movable to one position to permit flow of absorbing liquid to said vessel and to another position to stop flow of absorbing liquid and permit flow of the mixture of gases to said vessel, said third three-way stop cock being movable to one position to permit flow of rinsing liquid to said vessel and to another position to stop flow of rinsing liquid and permit flow of the mixture of gases to said vessel.

**2,773,749**
**TOWER AGITATION SYSTEM**
John C. Firtle, Pueblo, Colo.
Application April 16, 1953, Serial No. 349,273
7 Claims. (Cl. 23—271)

1. In an ore-processing system having a closed gas circuit including means for the circulation of gas therethrough and solution circuit including means for the circulation of liquids therethrough, an agitation battery common to both said circuits for the conditioning of ore through exposure and reaction to flow in said gas circuit, said battery comprising a succession of like, closed, vertically-elongated towers communicating at their upper ends through a comomn manifold with the outflow phase of said gas circuit, a tubular column wholly within and longitudinally of each said tower effective to agitate the tower contents in reaction to input of fluid pressure at its lower end, a conduit spacedly paralleling each said column interiorly of the associated tower and extending laterally through the wall thereof to deliver within the next succeeding tower for transfer of tower contents in reaction to input of fluid pressure at its lower end, the said conduit of the tower terminating the battery delivering to processing elements of the solution circuit, a gas return phase line, nozzles through the bases of said towers served by said gas return line and disposed for delivery within lower ends of said columns and conduits, means for selectively regulating the gas input through said nozzles, a solution circuit return phase line serving the tower first in the battery succession, and ore-feeding means serving said latter tower.

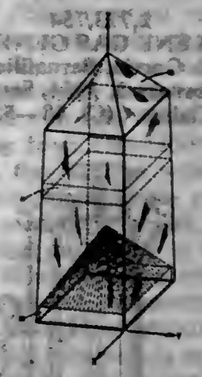
**2,773,750**
**FURNACE**
Leland Consaul, Lachine, Ohio, assignor, by mesne assignments, to The Cleveland Trust Company, Cleveland, Ohio, an Ohio banking corporation
Application June 14, 1951, Serial No. 231,473
6 Claims. (Cl. 23—277)



1. In a furnace, the combination of a closed chamber structure comprising a crucible with bottom and side walls formed of refractory material of good thermal conductivity, a cover closing the top of the crucible, and a solid core structure of considerable mass formed of refractory material of good thermal conductivity and supported directly on the bottom wall of the crucible with the major part of its bottom surface in good heat-conducting engagement with the major part of the upper surface of the bottom wall of the crucible, the core structure extending upward from the crucible bottom wall to form for the furnace an annular charge-treating space between the core structure and the side wall of the crucible and the chamber structure having in the upper part thereof a charging opening for delivery of solid material into the annular charge-treating space and a

separate discharge opening for vapors and having in the bottom thereof a discharge passage for molten material; and means wholly outside the charge-treating space for heating the side and bottom walls of the crucible and causing effective heating of the core by the conduction of heat thereto from the bottom wall of the crucible.

**2,773,751**
**CRYSTAL GROWING METHOD**
Allan E. Carlson, Euclid, Ohio, assignor to Clevite Corporation, Cleveland, Ohio, a corporation of Ohio
Application October 12, 1953, Serial No. 385,315
8 Claims. (Cl. 23—302)

1. A method of inhibiting the side growth of P-type dihydrogen phosphate crystals during the growth thereof in a growing solution of such crystals, which comprises the step of providing in the growing solution, in an amount sufficient to have significant crystal side growth inhibiting effect, polyphosphate falling within the groups consisting of those containing the ions $P_3O_9^{---}$ and $P_3O_{10}^{---}$.

---

**2,773,752**
**CRYSTALLIZATION OF SODIUM CYANIDE**
Vincent W. Kreuser and Charles H. Lembo, Niagara Falls, N. Y., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application July 20, 1953, Serial No. 369,034
4 Claims. (Cl. 23—302)

1. The method of producing white crystalline sodium cyanide which comprises continuously feeding a con-

centrated solution of sodium cyanide into an evaporator held at a temperature of 50°–70° C. and a pressure of 40–80 mm. of mercury, forming a slurry in said evaporator comprising saturated mother liquor and crystals of sodium cyanide, maintaining a concentration of sodium hydroxide of between 0.2 and 3% in said mother liquor and continuously separating a portion of said crystals from said mother liquor and recycling a portion of said liquor.

---

2,773,753

**PROCESS FOR PRODUCING AMMONIUM NITRATE OF ANY DESIRED SIZE PARTICLE**

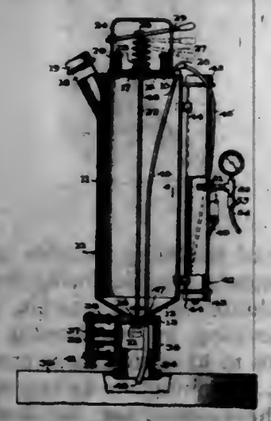
Leonard A. Stengel, Terre Haute, Ind., assignor to Commercial Solvents Corporation, Terre Haute, Ind., a corporation of Maryland

No Drawing. Application January 6, 1953, Serial No. 329,923

1 Claim. (Cl. 23—313)

A continuous process of producing solid granular ammonium nitrate of predetermined particle size which comprises continuously depositing a stream of molten ammonium nitrate on the top of a flat, moving, endless cooling surface, controlling the rate of flow of the molten ammonium nitrate and the speed of the cooling surface so that the molten mass solidifies in the form of a sheet having a thickness ranging from about 1/16 to 3/16 of an inch and corresponding substantially to the particle size desired in the granular product, cooling the said sheet to a temperature below 200° F. and then crushing and granulating the sheet to an average particle size ranging from about 1/16 to 3/16 of an inch and corresponding substantially to the thickness of said sheet.

---



2,773,754

**ACETYLENE GAS GENERATOR**

Leopold E. Garcia, Bernalillo, N. Mex.

Application February 3, 1954, Serial No. 407,838

2 Claims. (Cl. 48—53.3)

1. A carbide gas generator comprising a water holding tank, a closed carbide container disposed above and in communication at its lower end with said tank, a valve controlling the supply of carbide to said tank, said container having an opening at the top thereof, a pressure responsive diaphragm connected to said valve and overlying said top opening, a first spring bearing at one end against said diaphragm and opposing internal pressure in said generator, a bracket having an annular base overlying and engaging the peripheral margin of said diaphragm, other spring means holding said base and said margin against said container to close said top opening, a lever pivoted to said bracket and attached to the other end of said first spring, said bracket having means for selectively holding said lever in a plurality of positions to vary the compression of said first spring thereby to move said valve to closed position at selected pressures, said other spring means yielding to a predetermined pressure in said container to permit said diaphragm to be moved away from said top opening thereby to release gas under pressure from said container, and a back pressure chamber containing water and having an inlet in communication with said tank and also having an outlet.

**VAPOR STORAGE VESSEL**

Lyle V. Larson, Chicago, Ill., assignor to Chicago Bridge & Iron Company, a corporation of Illinois

Application June 2, 1953, Serial No. 359,147

1 Claim. (Cl. 48—174)

A thin wall rigid self-sustaining vapor storage vessel comprising: a self-supporting spherical-like shell of relatively light weight material incomplete at its bottom to form an open circular base portion; a vertical annular skirt attached to said base portion; a shallow conical vapor tight bottom secured to the bottom of said skirt and forming a vapor tight vessel with said skirt and shell; a flexible floating diaphragm within and secured to said shell and dividing the vessel into two compartments; an annular inclined perforated plate diagonally positioned between the lower end of said shell and the bottom, forming a vapor distributing chamber around the bottom of the vessel between said perforate plate and said vertical skirt; inlet and outlet means communicating with said distributing chamber; a foundation ring resting on ground surface and supporting said shell by indirectly engaging said skirt; fill material within said ring and between said ground surface and said conical bottom and forming a support for the latter, said foundation ring having sufficient weight to resist overturning movement of wind pressure; and means for securing said skirt to said foundation ring, whereby said vessel may be supported directly upon a foundation ring resting directly upon ground surface unprepared except as to leveling.

**PROCESSES FOR THE PRODUCTION OF CARBON MONOXIDE AND HYDROGEN FROM METHANE OR THE LIKE**

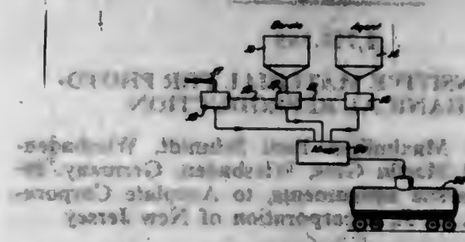
Heinrich Merkel, Essen, Germany, assignor, by mesne assignments, to Koppers Company, Inc., Pittsburgh, Pa., a corporation of Delaware

No Drawing. Application December 31, 1952, Serial No. 329,142

7 Claims. (Cl. 48—196)

1. A catalytic process for the production of synthesis gas containing carbon monoxide and hydrogen of high purity and of a relatively low nitrogen content without substantially impairing the activity of an iron conversion catalyst employed in the process, which comprises subjecting to partial combustion a mixture of a normally gaseous hydrocarbon and a gas selected from the group consisting of oxygen and oxygen-enriched air, the oxygen being present in an amount insufficient to react completely with said hydrocarbon, to thereby form a gaseous product of partial combustion comprising carbon monoxide, carbon dioxide, steam, and unreacted normaly gaseous hydrocarbon, admixing said gaseous product with an amount of synthesis gas containing carbon monoxide and hydrogen sufficient to produce a gaseous mixture in which the partial pressure of the steam and the partial pressure of the carbon dioxide are reduced to substantially the value which would be obtained if the gaseous product of partial combustion was produced as the result of subjecting a partial combustion a mixture of said normally gaseous hydrocarbon and air of normal oxygen content, and thereafter passing the thus-produced gaseous mixture into contact with the iron catalyst to thereby convert said gaseous product of partial combustion to synthesis gas consisting primarily of carbon monoxide and hydrogen.

---



2,773,757

**PROCESS AND COMPOSITION FOR APPLICATION OF SODIUM BORATE FOR VEGETATION CONTROL**

George A. Connell, Los Angeles, and Elden L. Paddock, Orange, Calif., assignors, by mesne assignments, to United States Borax & Chemical Corporation

Application May 14, 1953, Serial No. 355,132

11 Claims. (Cl. 71—2.2)

7. A composition of matter for hydraulic application to vegetation for controlling the growth thereof, said composition comprising an aqueous suspension containing between about 3 and about 12 pounds of borax per gallon of water, the borax being predominantly coarser than about 40 mesh, the suspension containing also a relatively finely divided granular substantially insoluble substance that is chemically inert with respect to the borax, said substance having thixotropic properties and being present in a concentration that is greater than about 1/6 that of the borax and is sufficient to render the suspension thixotropic and stable during prolonged storage, said suspension being thereafter liquifiable by mild agitation to permit hydraulic application of the suspension.

---

2,773,758

**HERBICIDAL COMPOSITIONS**

Arthur H. Schlesinger, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

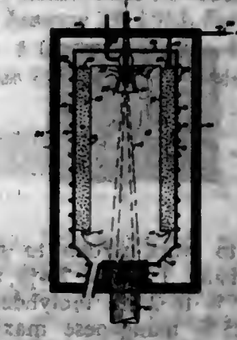
No Drawing. Application April 3, 1953, Serial No. 346,781

8 Claims. (Cl. 71—2.3)

1. A herbicidal composition comprising an oil-in-water emulsion of a phytotoxic quantity of a chloro-substituted 3-acetylbiphenyl.

---

2,773,759



**PRODUCTION OF REFRACTORY METALS**

Ralph S. Hood, Marblehead, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

Application February 19, 1952, Serial No. 272,378

5 Claims. (Cl. 75—84.5)

1. A process for producing a Group IV*a* metal selected from the group consisting of zirconium and titanium which comprises contacting the tetrachloride of said Group IV*a* metal with a gaseous reducing metal selected from the group consisting of sodium and magnesium in a reaction zone at a temperature higher than the boiling point of the chlorides of said reducing metal but below the boiling point of said Group IV*a* metal whereby condensed Group IV*a* metal and vaporous chlorides of said reducing metal are formed, passing liquid reducing metal and said vaporous chlorides into a heat exchange zone in heat exchange relationship with each other whereby said

liquid reducing metal is vaporized and said vaporous chlorides are condensed, and passing said vaporized reducing metal into the aforesaid reaction zone.

---

2,773,760

**PRODUCTION OF TITANIUM METAL**

Charles H. Winter, Jr., Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 25, 1950, Serial No. 192,158

6 Claims. (Cl. 75—84.5)

1. A method for refractory metal production comprising reducing a halide of said metal the halogen component of which has an atomic number greater than 9 by charging a reducing metal selected from the group consisting of alkali and alkaline earth metals having an electrode potential in aqueous solution greater than 2.0 into a plurality of closed reaction vessels maintained in direct communication with each other and under an atmospheric of an inert rare gas, isolating one of said vessels from the remainder and reacting the reducing metal charge therein with said metal halide at a reaction temperature ranging from 750–1100° C., upon substantial completion of the reaction withdrawing therefrom while in molten state metal halide reaction by-products formed during the reduction reaction, heating the sponge metal reaction product remaining in said vessel under a vacuum to distill off and remove refractory metal subhalides and reducing metal impurities present in said sponge, during the distillation operation again maintaining the plurality of reaction vessels in direct communication with each other and passing vapors evolved in such distillation into a vessel containing unreacted reducing metal charge while subjecting the latter vessel to external cooling to condense therein the vapors being passed thereto, upon completion of the purification and distillation operation again isolating the vessel containing said sponge metal product from the vessel into which said evolved vapors have been passed, recovering the purified refractory metal from said isolated vessel, and reacting within said temperature range the unreacted reducing metal charge in said vessel into which said evolved vapors have been passed with said refractory metal halide reactant and in the presence of the condensed products from said distillation operation.

---

2,773,761

**FERROUS CHROME ALLOY**

John H. Fregon, Calumet City, Ill., Walter F. Jicha, Hammond, Ind., and Emil Vesilik, Chicago, Ill., assignors to Calumet Steel Castings Corporation, Hammond, Ind., a corporation of Indiana

Application January 6, 1954, Serial No. 402,888

3 Claims. (Cl. 75—126)

2. A ferrous chrome alloy for casting purposes characterized, as cast, by a matrix of unresolved pearlite

having a Rockwell C hardness of substantially 45 and containing complex carbides of iron, chromium and molybdenum, the alloy being austenized by air quenching from substantially 2020° F. after which the same demon-

strates an ability to work-harden to substantially 65 Rockwell C, comprising, 1.8% to 2.4% carbon, 15% to 17% chromium, 1.5% to 2.0% molybdenum, 1.0% silicon maximum, 1.25% manganese maximum, and the balance iron.

---

2,773,762

## MANUFACTURE OF UNOXIDISABLE TIMEPIECE SPRINGS

Ernest Dubois, La Chaux de Fonds, and Bruno Siegrist and Charles Wahler, Geneva, Switzerland

No Drawing. Application March 27, 1951, Serial No. 217,872.
Claims priority, application Switzerland May 12, 1949
2 Claims. (Cl. 75—134)

1. An unoxidisable timepiece mainspring with high resistance to fatigue consisting of a thin ribbon formed of an alloy containing:

10–25% of iron
1–5% of titanium
1–5% of columbium
Up to 10% of tungsten
Up to 10% of molybdenum
Up to 20% of chromium
Up to 5% of tantalum
Rest of cobalt and nickel,

the nickel content being in the limits of 25–35%, the cobalt content being in the limits of 20–45% of the total weight and the content of columbium and titanium together being at least equal to 3% and not exceeding 7%, said alloy being hardened and the components of the alloy being in a state of structural equilibrium.

---

2,773,763

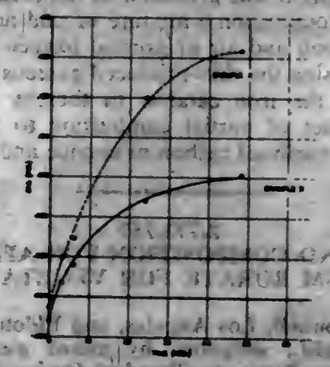
## MINERAL FIBER PRODUCT CONTAINING HYDRATED VIRGIN KRAFT PULP AND METHOD OF PRODUCING THE SAME

Wylmer L. Scott, Lancaster Township, Lancaster County, Pa., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

No Drawing. Application April 22, 1954, Serial No. 425,046
18 Claims. (Cl. 92—3)

1. A self-sustaining mineral fiber product comprising a major portion by weight of artificially formed mineral fibers and a binder therefor comprising virgin kraft pulp having a maximum average permanganate number of 24 and hydrated to a maximum average Canadian 3-gram freeness of 10.

---



2,773,764

## MINERAL FIBER PRODUCT

Arthur D. Park, Lancaster, Pa., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

Application April 22, 1954, Serial No. 425,047
5 Claims. (Cl. 92—3)

1. A self-sustaining acoustical board comprising nodulated, artificially formed mineral fibers, an amylaceous binder for the fibers, mineral filler, and as an agent for reducing the tendency of the material to sag under condi-

tions of high humidity 0.4% to 4.0% based on the total weight of the material of hydrated virgin kraft pulp.

---

2,773,765

## LIGHT SENSITIVE MATERIAL FOR PHOTOMECHANICAL REPRODUCTION

Oskar Süs and Maximilian Paul Schmidt, Wiesbaden-Biebrich, and Martin Glos, Wiesbaden, Germany, assignors, by mesne assignments, to Azoplate Corporation, Summit, N. J., a corporation of New Jersey

No Drawing. Application August 11, 1953, Serial No. 373,681
Claims priority, application Germany August 16, 1952
19 Claims. (Cl. 96—33)

1. An article for use in the manufacture of plates for photomechanical reproduction comprising a sheet metal base and a thin uniform light-sensitive layer coated on said base adapted to being converted into imaged and non-imaged areas, said layer including a water insoluble material of the group consisting of peri and ana nitronaphthalene-sulfonic acids of the group consisting of those sulfonic acids in which the sulfo group is esterified by an aromatic hydroxy compound, those in which the sulfo group is esterified by a heterocyclic hydroxy compound, those sulfonic acids which are amidated and in which the N-atom of the amide group is substituted by a member of the group consisting of aryl, alkyl and heterocyclic compounds.

---

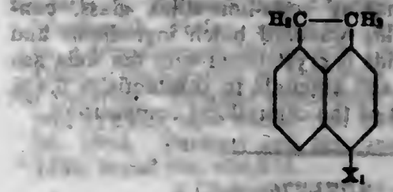
2,773,766

## LIGHT-SENSITIVE MATERIAL FOR PHOTOMECHANICAL REPRODUCTION AND PROCESS FOR THE PRODUCTION OF IMAGES

Oskar Sus and Karl Möller, Wiesbaden-Biebrich, Germany, assignors, by mesne assignments, to Azoplate Corporation, Summit, N. J., a corporation of New Jersey

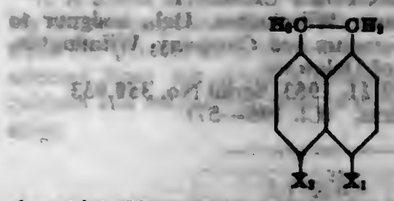
No Drawing. Application December 7, 1953, Serial No. 396,788
Claims priority, application Germany December 10, 1952
19 Claims. (Cl. 96—33)

1. A presensitized lithographic printing plate comprising a flexible sheet-like base of a material selected from the group consisting of aluminum, zinc and papers coated with a coating composition comprising mineral filler and adhesive, said base having a hydrophilic surface, a thin uniform layer coated on said surface of a light sensitive material including an ortho-nitro-formyl compound selected from the group consisting of ortho-nitro-aldehydes of the benzene and naphthalene series.



2,773,767

## LIGHT SENSITIVE MATERIAL



Martin Tessmann and Wilhelm Neugebauer, Wiesbaden-Biebrich, Germany, assignors, by mesne assignments, to Azoplate Corporation, Summit, N. J., a corporation of New Jersey

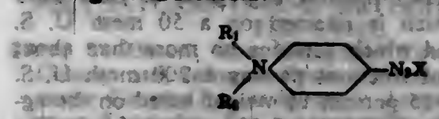
No Drawing. Application April 14, 1952, Serial No. 282,266
Claims priority, application Germany April 17, 1951
15 Claims. (Cl. 96—33)

1. A presensitized lithographic printing plate for use in the graphic arts, comprising a sheet metal base support material coated with a thin uniform and continuous layer adhering to said support, said layer comprising a compound selected from the group consisting of those having one of the following general formulae:

and

in which $X_1$ and $X_2$ stand for a member of the group consisting of halogen, nitro, alkoxy, acylated amino, and acyl residues of the general formula —CO—R in which R stands for a member of the group consisting of aromatic radical, an alkyl radical, an alkylene radical, an aromatically substituted alkyl radical, and an aromatically substituted alkylene radical.

---



2,773,768

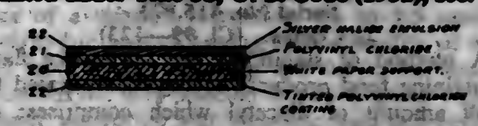
## LIGHT-SENSITIVE DIAZOTYPE MATERIAL

Theodorus Petrus Wilhelmus Sanders, Venlo, and Johannes Henricus Andreas Wilders, Blerick, Netherlands, assignors, by mesne assignments, to Chemische Fabriek L. van der Grinten N. V., Venlo, Netherlands, a corporation of the Netherlands

No Drawing. Application March 11, 1952, Serial No. 276,062
Claims priority, application Netherlands March 20, 1951
19 Claims. (Cl. 96—75)

1. Light-sensitive diazotype material comprising a support bearing a one-component diazo film layer which is suitable for development with a thin layer of an aqueous developer, wherein the diazo film layer is a continuous substantially dry and non-sticky layer of measurable thickness that covers said support, contains an organic colloidal solid film-forming material, is hydrophilic and contains substantially entirely within said layer a diazo compound of the general formula:

in which X is an anion and $R_1$ and $R_2$ are alkyl radicals together having a total of from 10 to 12 carbon atoms, each alkyl radical containing at least 4 and at most 7 carbon atoms, and not more than one of the two having a side chain attached to the alpha carbon atom.



2,773,769

## INSTANT DRYING PHOTOSTAT

Max H. Goldschein, Washington, D. C.

Application January 29, 1953, Serial No. 334,107
1 Claim. (Cl. 96—84)
(Granted under Title 35, U. S. Code (1952), sec. 266)

A rapid-drying, light-protected, non-projectible, composite printing sheet comprising an opaque, water-impervious, flexible white sheet of polyvinyl chloride impregnated with zinc oxide, a light-sensitive silver halide coating on one surface of the sheet adapted to reproduce a latent image on exposure to light, the sheet carrying red tinting spaced from the light-sensitive coating resisting the passage of actinic rays through the sheet when rolled in storage, whereby further exposure of the latent image prior to development of the print is prevented, and the unrolled developed print immediately when drawn from developing, fixing and washing baths is substantially in dry condition.

---

2,773,770

## FEEDS CONTAINING ANIMAL PROTEIN FACTORS, VITAMIN $B_{12}$ AND OTHER GROWTH-PROMOTING FACTORS

Bunro Maki, Tokyo, and Ikuo Ushikoshi, Chiba-ken, Japan; said Ushikoshi assignor to said Maki

No Drawing. Application December 7, 1951, Serial No. 260,544
1 Claim. (Cl. 99—9)

A method for the preparation of an all vegetable feed for livestock comprising essentially aerobically fermenting a solid vegetable medium, spread over a hurdle, said medium wetted with not more than about 10% by weight thereof of corn juice and inoculated with *Neurospora crossa* to form a growth promoting substance, said *Neurospora crossa* growing for about one to four days at a temperature of from about 20° C. to about 44° C., whereafter the medium is inoculated with *Rhizopus nigricans* and growth permitted for an additional period of time of at least about one day at a temperature of from about 20° C. to about 44° C., after which the medium is dried and pulverized.

---

2,773,771

## SYNERGISTIC COMPOSITIONS OF MATTER COMPRISING THE ALCOHOL-SOLUBLE MOIETY OF VEGETAL LECITHIN

Percy L. Julian, Oak Park, Herbert T. Iverson, Elmhurst, and Sol B. Radlove, Chicago, Ill., assignors to The Glidden Company, Cleveland, Ohio, a corporation of Ohio

No Drawing. Application June 5, 1952, Serial No. 291,974
11 Claims. (Cl. 99—15)

1. As a composition of matter, a synergistic emulsifier mixture composed by weight of 10–35% of the alcohol-soluble moiety of vegetable lecithin, balance substantially all at least one substance having hydrophylic and lipophylic groups and selected from the group consisting of mixtures of mono- and di-glycerides, vegetable oils which have been hydroxylated in the presence of a lower hydroxy carboxylic acid until the iodine value has been reduced at least 20 units, and long chain fatty acid partial esters of anhydrides of hexahydric alcohols, said mixture giving a volume of gelatinized starch of not more than 40 milliliters in the Bradley amylose test, and being substantially free of the alcohol-insoluble moiety of vegetable lecithin.

2,773,772

**METHOD OF IMPARTING A BUTTER-LIKE FLAVORING TO FAT-CONTAINING FOOD PRODUCTS AND THE RESULTING PRODUCT**

Dwight E. Mather, Chicago, Ill., assignor to Swift & Company, Chicago, Ill., a corporation of Illinois

No Drawing. Application March 12, 1954, Serial No. 415,973

21 Claims. (Cl. 99—123)

1. A method of stabilizing the butter-like flavor of fat-containing food products having incorporated therein a small amount of diacetyl which comprises: adding thereto a small amount of butyl alcohol.

2,773,773

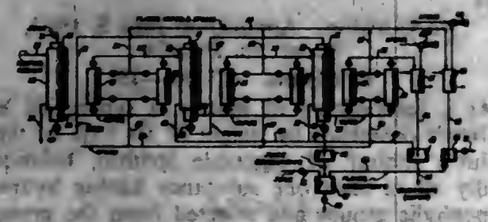
**SEALING PROCESS**

Clarence L. Hunter and Henry H. Wright, Fredericksburg, Va., assignors to American Viscose Corporation, Wilmington, Del., a corporation of Delaware

Original application May 19, 1949, Serial No. 94,164, now Patent No. 2,653,432, dated September 29, 1953. Divided and this application July 27, 1953, Serial No. 370,504

2 Claims. (Cl. 99—176)

1. The method of producing a stuffed product which comprises continuously passing a continuous hydrophilic sheet material through a path, overlapping opposite lateral edges of the sheet at a point in the path to form a tubular casing, continuously passing an elongated thermoplastic member through another path merging with the first path between the overlapped edges of the sheet, preheating the member to render it adhesive as it proceeds to the point of merging, pressing the member and the overlapped edges to bond them together and thereby seal the casing, continuously passing a plastic foodstuff through a third path extending into the tubular casing, confining the plastic foodstuff out of contact with the casing as it passes through the point of sealing, and thereafter discharging the plastic foodstuff into direct contact with the interior of the casing at a point beyond the point of sealing.



2,773,774

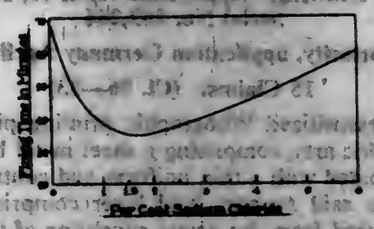
**CONCENTRATION OF FRUIT JUICES**

Albert G. McCarthy, Tampa, Fla., and Carlos A. Irazoqui, New York, N. Y., assignors to National Engineering & Development Corporation, New York, N. Y.

Application September 22, 1953, Serial No. 381,628

12 Claims. (Cl. 99—205)

1. In a process for producing a fruit juice concentrate which includes the step of evaporating water and volatile flavoring materials from fruit juice, the improvement which comprises, adsorbing on a solid adsorbent flavoring materials vaporized with said water, recovering said flavoring materials from said adsorbent as a liquid flavor concentrate and adding at least a portion of said flavor concentrate to said juice concentrate.



2,773,775

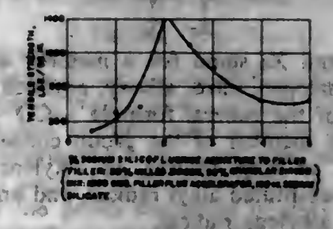
**GLASS COMPOSITION AND BATCH THEREFOR**

William C. Lovegood, Toledo, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio

Application December 21, 1953, Serial No. 399,426

10 Claims. (Cl. 106—52)

1. A batch for making soda-lime-silica glass, consisting essentially of the standard batch ingredients and wherein sodium chloride is crystallized with the soda ash content of the batch and amounts to substantially 0.6% to 4.0% of the weight of the crystallized composition.



2,773,776

**REFRACTORY CEMENT**

Verne Wesley Weldmann, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Application April 21, 1953, Serial No. 350,033

3 Claims. (Cl. 106—57)

1. A corrosion-resistant refractory cement composition consisting essentially of a workable mixture made up of a filler of granular zircon having a particle size distribution such that approximately one-third lies in the range from 80 to 160 mesh, one-third from 160 to 180 mesh and one-third finer than 180 mesh and milled zircon having a particle size distribution such that aproximately 95% by weight is finer than 325 mesh, said granular zircon being in the proportion of about 50 to 75% by weight of the total zircon, about 1½ to 2% by weight sodium silicofluoride setting accelerator, and a binder of aqueous sodium silicate.

2,773,777

**BITUMINOUS COMPOSITIONS**

Peter Alexander, Surbiton, and David Rupert Leach, Warrington, England, assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Application December 30, 1953, Serial No. 401,382

13 Claims. (Cl. 106—96)

1. A bituminous composition comprising as the sole aggregate a siliceous mineral aggregate, at least 50% by weight of which is retained on a 50 mesh U. S. standard sieve and which contains no more than about 25% by weight of fractions passing a 200 mesh U. S. standard sieve, 5–15 percent by weight based on the aggregate of Portland cement, 5–20 percent by weight based on the aggregate of an asphalt emulsified in water with sodium caseinate to form an emulsion containing 40–60% asphalt having an ASTM penetration between about 40 and about 500 at 25° C. and 0.2–2 percent by weight based on the aggregate of calcium chloride.

2,773,778

**ORGANIC FILM-FORMING PLASTIC CONTAINING 2,2',4,4'-TETRAHYDROXYBENZOPHENONE AS ULTRAVIOLET ABSORBENT**

Paul K. Hoch and Robert W. Wynn, Easton, Pa., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application September 7, 1951, Serial No. 245,642

4 Claims. (Cl. 106—187)

1. An ultraviolet absorbing composition of matter comprising a light-transmitting organic film-forming plastic carrier having uniformly dispersed therein 2,2',4,4'-tetrahydroxybenzophenone.

2,773,779

**TREATING SOLUTION FOR PHOTOLITHOGRAPHIC PRINTING PLATES**

Frederic E. Brinstick and Charles H. Van Dusen, Jr., Westbrook, Maine, assignors, by mesne assignments, to Addressograph-Multigraph Corporation, Cleveland, Ohio, a corporation of Delaware

No Drawing. Original application April 23, 1951, Serial No. 222,523, now Patent No. 2,692,872, dated October 26, 1954. Divided and this application January 25, 1954, Serial No. 406,075.

2 Claims. (Cl. 106—243)

1. A liquid desensitizer solution for planographic printing plates composed of oleic acid having dissolved therein from 0.1 percent to 5 percent of a water-insoluble soap selected from the group consisting of aluminum, zinc, calcium and magnesium salts of oleic, stearic and plamitic acids.

2,773,780

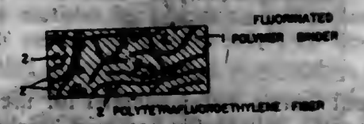
**EXTERIOR SURFACE COATINGS**

Donald F. Kocmecks, Elizabeth, and Joseph F. Nelson, Westfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application June 16, 1953, Serial No. 362,148

13 Claims. (Cl. 106—243)

13. A surface coating comprising an oily polymer of butadiene-1,3 and at least 1% of a solid water insoluble salt of a metal of the group consisting of aluminum, zinc, calcium and magnesium and an acid from the group consisting of lauric, palmitic and stearic.



2,773,781

**COATED ARTICLE AND METHOD OF MAKING**

Ernest A. Rodman, Newburgh, N. Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Application September 24, 1954, Serial No. 458,288

8 Claims. (Cl. 117—138.8)

1. A fibrous structure of polytetrafluoroethylene filaments impregnated with a copolymer of tetrafluoroethylene and hexafluoropropylene fused into a matrix.

2,773,782

**FELT SATURANTS AND METHOD OF MAKING THE SAME**

Lloyd V. Hassel, East Hempfield Township, Lancaster County, and John A. Parker, Manor Township, Lancaster County, Pa., assignors to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

No Drawing. Application August 11, 1953, Serial No. 373,688

5 Claims. (Cl. 117—140)

4. A waterproof felt adapted for use as a floor covering backing comprising felt saturated with the product obtained by heating siccative oil acids in the presence of about 5% to about 10% excess of at least one polyol having a functionality greater than 2 solely from hydroxyl groups to esterify said acids, heating the resulting material in the presence of 0.4 to 0.8 mole of an alpha, beta, olefinically unsaturated dicarboxylic acid per mole of ester, and heating said acid reaction product in the presence of a mixture containing 0.6 to 1.5 equivalent of a polyhydric alcohol having a functionality of at least 3 solely from hydroxyl groups and 0.2 to 0.6 equivalent of a dicarboxylic acid selected from the group consisting of phthalic anhydride and dilinoleic acid per equivalent of said acid reaction product.

2,773,783

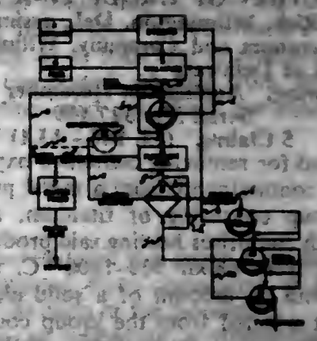
**PRODUCTION OF WELL DRILLING STARCHES**

Klaus Laustroth, Houston, Tex., assignor to National Lead Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application April 1, 1952, Serial No. 279,967

3 Claims. (Cl. 127—32)

1. The process of preparing a starchy filter loss reducing additive for drilling muds comprising, adding urea to a slurry the major constituents of which are water and a substance chosen from the class of starch and starchy flours in an amount equal to from 0.2 to 2.0 percent of urea by weight of said starchy substance, heating the slurry to a temperature at least as high as the gelatinization temperature of the starch contained therein, and drying the heated slurry for at least part of the time in contact with a heated metal surface.



2,773,784

**STARCH MANUFACTURING PROCESS INVOLVING FLOTATION AND CENTRIFUGAL SEPARATION**

Edgar H. Williams, Glen Ellyn, Ill., assignor to Corn Products Refining Company, New York, N. Y., a corporation of New Jersey

Application April 4, 1952, Serial No. 280,548

2 Claims. (Cl. 127—68)

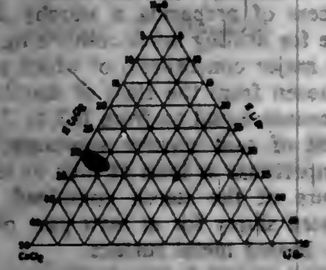
1. In the process of obtaining starch from grain wherein the grain is steeped, comminuted and subjected in water to germ and fibre separating operations yielding mill starch liquor containing starch, gluten and solubles; treating mill starch to yield a gluten rich fraction and a starch rich fraction; the improvement which comprises adjusting the gravity of the mill starch liquor to about 12° Bé. to about 19° Bé. at 60° F. subjecting the liquor to froth flotation to obtain a gluten rich fraction and a starch rich fraction; and thereafter adjusting the gravity of the starch fraction to about 10° Bé. to about 12° Bé. at 60° F. and subjecting the starch fraction to continuous centrifugal separation to separately remove gluten in an overflow and starch in underflow, supplying to the centrifuge for flushing operations water having the same solubles content as the starch fraction entering the centrifuge, and using process waters derived from the overflow and underflow for steeping and subsequent milling operations.

2,773,785

## APPETITE SATIENT COMPOSITION

Edgar A. Ferguson, Jr., Brooklyn, N. Y.

No Drawing. Application August 15, 1952, Serial No. 304,635
5 Claims. (Cl. 131—17)



1. As a new article of manufacture a combustible substance adapted to be used in smoking having intimately admixed therewith and distributed therethrough tartaric acid in an amount of between 0.01–0.04 gram tartaric acid per each gram of said combustible substance which upon combustion of said combustible substance volatilizes to act in the mouth of the person smoking to reduce the appetite.

2,773,786

## ELECTROLYTE FOR PRIMARY GALVANIC CELLS

George T. Jobe, Cleveland, Ohio, assignor to Union Carbide and Carbon Corporation, a corporation of New York

Application June 12, 1953, Serial No. 361,192
2 Claims. (Cl. 136—155)

1. In a low temperature primary galvanic cell of the zinc-carbon-manganese dioxide system having an aqueous electrolyte containing up to 20% zinc chloride and up to 3% ammonium chloride, the improvement which comprises the incorporation in such electrolyte of 23% to 32% calcium chloride and 0.5% to 7% lithium bromide by weight of electrolyte.

2,773,787

## PRODUCTION OF GROUP IV-A METALS

Christian E. Rick, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application December 20, 1952, Serial No. 327,159
5 Claims. (Cl. 148—13.1)

4. A method for removing combined oxygen and nitrogen impurity contaminants from a metal product selected from the group consisting of titanium, zirconium and hafnium which comprises heating said product to temperatures ranging from about 500–1800° C. under an inert atmosphere with an amount of a solid elemental metal-treating agent selected from the group consisting of germanium, gallium and indium substantially the chemical equivalent of said contaminants and until the latter volatilizes as compounds of said treating agent, effecting said heating in a closed reaction zone and at a temperature at least equal to the volatilization temperature of said compound but below the boiling point of said treating agent, and separating and recovering the resulting purified, treated metal product from said volatilized contaminant compounds.

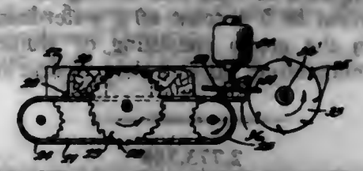
2,773,788

## LAMINATE AND RESINOUS COMPOSITION

John K. Magrane and William S. Sloatman, Jr., Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application January 13, 1955, Serial No. 481,702
10 Claims. (Cl. 154—43)

9. A laminate comprising the heat and pressure consolidated structure of a core stock impregnated with 25%–35% by weight of a thermosetting resinous composition, a 6–12 mil print sheet impregnated with from about 35% to about 45% by weight of a melamine-formaldehyde resinous composition and a 2–5 mil overlay sheet impregnated with from about 60% to about 75% by weight of a melamine-formaldehyde resinous composition; wherein the melamine-formaldehyde resinous compositions contain from about 1% to about 35% by weight of a mixture of (1) a α-alkyl-D-glucoside, wherein the alkyl group thereof contains from about 1 to 4 carbon atoms and (2) the methylol derivative of a compound containing the group



wherein X is a member selected from the group consisting of $SO_2$ and CO and wherein the weight ratio of said glucoside to said methylol derivative compound is from about 1:3 to about 3:1 respectively.

2,773,789

## CROSSCUT FIBER AND METHOD FOR ITS PREPARATION

James D'A. Clark, Longview, Wash., assignor to Longwood Corporation, Chicago, Ill., a corporation of Illinois

Application March 23, 1953, Serial No. 344,089
12 Claims. (Cl. 154—45.9)

1. A crosscut woody wafer adapted for use in a consolidated structure, said wafer having a thickness within the range of 0.002 to 0.015 inch in which the fibers are substantially parallel to and extend longitudinally of the wafer and having a length at least ten times the thickness of the wafer but less than 5 inches with the ends of the wafer at an acute angle with the broad faces.

2,773,790

## HARD MOLDED BOARD

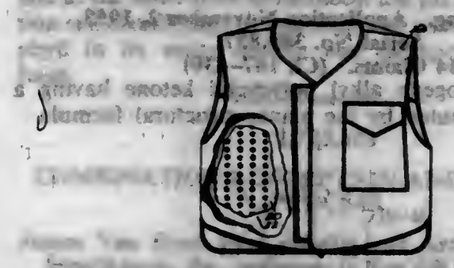
James D'A. Clark, Longview, Wash., assignor to Longwood Corporation, Chicago, Ill., a corporation of Illinois

Application September 2, 1955, Serial No. 532,146
9 Claims. (Cl. 154—45.9)

1. A crosscut woody wafer adapted for use in a consolidated structure, said wafer having a thickness within the range of 0.015–0.065 inch in which the fibers are substantially parallel to and extend longitudinally of the wafer and having a length at least ten times the thickness of the wafer but less than 5 inches with the ends of the wafers at an acute angle with the broad faces.

2,773,791

## ARMORED GARMENT



Charles P. MacIver, Stowe, Mass., assignor to the United States of America as represented by the Secretary of the Army

Application January 19, 1954, Serial No. 405,059
16 Claims. (Cl. 154—52.5)

1. Armored garment comprising outer, a plurality of intermediate, and inner layers of woven high tenacity

elongatable plastic textile material, said layers being resin spot-laminated, the spot-laminations of said outer, intermediate and inner layers being located between alternate plies and transversely aligned in columns, and said spot-laminations being discontinuous and arranged

in spaced rows extending over substantial portions of the area of said garment, said spaced rows being staggered in depth; whereby said garment is rendered highly flexible.

2,773,792

## METHOD OF MAKING A LAMINATED STRUCTURE

Robert J. Nebesar, Bristol, Tenn., assignor to Universal Moulded Products Corporation, Bristol, Va., a corporation of Delaware

Application June 19, 1953, Serial No. 362,740
1 Claim. (Cl. 154—110)

The method of forming a laminated structure which comprises forming a resin-impregnated fabric spar, molding said spar together with cellular plastic in a mold to conform the cellular plastic to the spar and to the mold, subsequently surrounding said spar and cellular plastic with a pair of resin-impregnated fabric sheets and molding the sheets, the spar and the cellular plastic into a unitary structure within the same mold.

2,773,793

## MODIFIED MELAMINE RESINS

George L. Fraser, Williamsburg, and Curtis Elmer, Springfield, Mass., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application March 19, 1953, Serial No. 343,493
6 Claims. (Cl. 154—128)

1. In the method for preparing a laminate in which a plurality of resin-impregnated layers of fibrous material are assembled in superimposed relationship, placed under pressure and heated until the resin has cured, the improvement which comprises impregnating said fibrous material with a mixture of 95.0–99.9% by weight of a low molecular weight melamine-formaldehyde condensate and, correspondingly, 5.0–0.1% by weight of an aromatic biguanide which dissociates in water to yield a pH of from 10 to 12, said aromatic biguanide having the formula:

wherein Ar is taken from the group consisting of phenyl and naphthyl radicals and the ring-substituted alkyl and chlorine derivatives thereof, and R, R' and R" are taken from the group consisting of hydrogen and alkyl radicals having from 1 to 6 carbon atoms.

5. The method of claim 1 in which the fibrous material employed is glass.

2,773,794

## MELAMINE CONDENSATION PRODUCTS

George L. Fraser, Williamsburg, and Curtis Elmer, Springfield, Mass., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

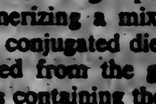
No Drawing. Application March 19, 1953, Serial No. 343,491
5 Claims. (Cl. 154—138)

1. In the method for preparing a laminate in which a plurality of resin-impregnated layers of fibrous material are assembled in superimposed relationship, placed under pressure and heated until the resin has cured, the improvement which comprises impregnating said fibrous material with a co-condensation product of melamine, a phenyl melamine, and formaldehyde, the molar ratio of melamine to phenyl melamine varying between 1:0.1–1:0.3 and the molar ratio of combined melamine and phenyl melamine to formaldehyde varying between 1:2 and 1:3, said co-condensation product having been prepared at a pH of 8–12, said phenyl melamine being a member of the group consisting of phenyl melamine, monochlorophenyl melamines, dichlorophenyl melamines, nitrophenyl melamines, and alkylphenyl melamines in which the alkyl group is saturated and contains up to 9 carbon atoms.

2,773,795

## RUBBER-FABRIC LAMINATES AND METHOD OF MAKING SAME

William B. Reynolds, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware



No Drawing. Application January 5, 1953, Serial No. 329,722
15 Claims. (Cl. 154—139)

1. A non-metallic fabric-rubber laminate comprising at least one fabric element and a layer of rubber attached thereto, the elements of said laminate having been bonded by means of a bonding agent comprising an aqueous acid solution containing at least 0.5 weight percent of a copolymer prepared by polymerizing a mixture consisting essentially of at least one conjugated diene and a polymerizable compound selected from the group consisting of pyridines and quinolines containing the group

where R is selected from the group consisting of H and $CH_3$, said conjugated diene comprising at least 10 parts by weight per 100 parts of the monomers.

6. A process of preparing a rubber-fabric laminate comprising treating the fabric with an aqueous acid solution containing at least 0.5 weight percent of a copolymer prepared by polymerizing a mixture consisting essentially of at least one conjugated diene and a polymerizable compound selected from the group consisting of pyridines and quinolines containing the group

where R is selected from the group consisting of H and $CH_3$, said conjugated diene component comprising at least 10 parts by weight per 100 parts of monomers, passing the thus treated fabric through an alkaline bath to precipitate the polymer in the fabric, applying a layer of rubber thereto, and heating the resulting laminate to vulcanize said rubber and to form a strong rubber-to-fabric bond.

2,773,796

## PROCESS FOR THE PREPARATION OF ALKYL ESTERS OF ACRYLIC ACID

Hans Bluestein, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 31, 1952, Serial No. 328,844
4 Claims. (Cl. 260—486)

1. A process for the preparation of alkyl esters of acrylic acid which comprises reacting acrylic acid with a tertiary alkyl ether of ethylene glycol in the presence of a catalyst selected from the group consisting of sulfuric acid, phosphoric acid, and p-toluenesulfonic acid, at a temperature between about 50° C. and about 150° C., and recovering the resulting alkyl ester of acrylic acid.

2,773,797

## PROCESS FOR THE PREPARATION OF ALKYL ESTERS OF METHACRYLIC ACID

Hans Bluestein, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 31, 1952, Serial No. 328,845
4 Claims. (Cl. 260—486)

1. A process for the preparation of alkyl esters of methacrylic acid which comprises reacting methacrylic acid with a tertiary alkyl ether of ethylene glycol in the presence of a catalyst selected from the group consisting of sulfuric acid, phosphoric acid, and p-toluenesulfonic acid, at a temperature between about 50° C. and about 150° C., and recovering the resulting alkyl ester of methacrylic acid.

2,773,798

## PROCESS FOR THE PREPARATION OF ALKYL ESTERS OF ACRYLIC ACID

Hans Bluestein, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 31, 1952, Serial No. 328,846
4 Claims. (Cl. 260—486)

1. A process for the preparation of alkyl esters of acrylic acid which comprises reacting acrylic acid with a tertiary alkyl ether of diethylene glycol in the presence of a catalyst selected from the group consisting of sulfuric acid, phosphoric acid, and p-toluenesulfonic acid, at a temperature between about 50° C. and about 150° C., and recovering the resulting alkyl ester of acrylic acid.

2,773,799

## PROCESS FOR THE PREPARATION OF ALKYL ESTERS OF METHACRYLIC ACID

Hans Bluestein, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 31, 1952, Serial No. 328,847
4 Claims. (Cl. 260—486)

1. A process for the preparation of alkyl esters of methacrylic acid which comprises reacting methacrylic acid with a tertiary alkyl ether of diethylene glycol in the presence of a catalyst selected from the group consisting of sulfuric acid, phosphoric acid, and p-toluenesulfonic acid, at a temperature between about 50° C. and about 150° C., and recovering the resulting alkyl ester of methacrylic acid.

2,773,800

## PROCESS FOR THE PREPARATION OF ALKYL ESTERS OF ACRYLIC ACID

Hans Bluestein, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 31, 1952, Serial No. 328,848
4 Claims. (Cl. 260—486)

1. A process for the preparation of alkyl esters of acrylic acid which comprises reacting acrylic acid with a tertiary alkyl ether of triethylene glycol in the presence of a catalyst selected from the group consisting of sulfuric acid, phosphoric acid, and p-toluenesulfonic acid, at a temperature between about 50° C. and about 150° C., and recovering the resulting alkyl ester of acrylic acid.

2,773,801

## PROCESS FOR THE PREPARATION OF ALKYL ESTERS OF METHACRYLIC ACID

Hans Bluestein, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 31, 1952, Serial No. 328,849
4 Claims. (Cl. 260—486)

1. A process for the preparation of alkyl esters of methacrylic acid which comprises reacting methacrylic acid with a tertiary alkyl ether of triethylene glycol in the presence of a catalyst selected from the group consisting of sulfuric acid, phosphoric acid, and p-toluenesulfonic acid, at a temperature between about 50° C. and about 150° C., and recovering the resulting alkyl ester of methacrylic acid.

2,773,802

## PROCESS FOR THE PREPARATION OF ALKYL ESTERS OF ACRYLIC ACID

Hans Bluestein, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 31, 1952, Serial No. 328,850
4 Claims. (Cl. 260—486)

1. A process for the preparation of alkyl esters of acrylic acid which comprises reacting acrylic acid with a tertiary alkyl ether of tetraethylene glycol in the presence of a catalyst selected from the group consisting of sulfuric acid, phosphoric acid, and p-toluenesulfonic acid, at a temperature between about 50° C. and about 150° C., and recovering the resulting alkyl ester of acrylic acid.

2,773,803

## PROCESS FOR THE PREPARATION OF ALKYL ESTERS OF METHACRYLIC ACID

Hans Bluestein, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 31, 1952, Serial No. 328,851
4 Claims. (Cl. 260—486)

1. A process for the preparation of alkyl esters of methacrylic acid which comprises reacting methacrylic acid with a tertiary alkyl ether of tetraethylene glycol in the presence of a catalyst selected from the group consisting of sulfuric acid, phosphoric acid, and p-toluenesulfonic acid, at a temperature between about 50° C. and about 150° C., and recovering the resulting alkyl ester of methacrylic acid.

2,773,796

**METHOD OF PROTECTING PLANTS FROM FUNGI BY APPLYING HYDRAZINE SALTS OF INORGANIC PHOSPHOROUS ACIDS**

Johannes Thiesse Hochmann and Gerardus Franciscus Elias Maria Diedrich, Amsterdam, Netherlands, assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Application September 16, 1953, Serial No. 380,607
Claims priority, application Germany September 26, 1952
5 Claims. (Cl. 167—14)

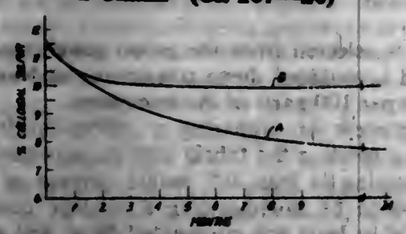
1. A method for protecting plants from destruction by fungi which comprises applying to the plants the hydrazine salt of an inorganic phosphorus acid selected from the group consisting of phosphoric acid, phosphorous acid, hypophosphoric acid, and pyrophosphoric acid in an amount toxic to said fungi, said hydrazine salt having a mole ratio of acid to hydrazine from 0.5:1 to 2:1 and being essentially free of metal constituents.

2,773,797

**METHOD OF INCREASING THE COLLOIDAL SULFUR CONTENT OF BENTONITE-SULFUR MIXTURE**

Edward F. Orwell, Medina, N. Y., assignor to Food Machinery and Chemical Corporation, San Jose, Calif.

No Drawing. Application October 10, 1951, Serial No. 250,795
2 Claims. (Cl. 167—20)



2. The steps in the method of preparing bentonite clay containing colloidal sulfur which comprise adding to a mixture of bentonite clay and noncolloidal elemental sulfur, in the range one part bentonite clay to one part noncolloidal elemental sulfur to four parts bentonite clay to one part noncolloidal elemental sulfur by weight, an amount of water sufficient to produce a moisture content in the mixture of 20% to 75% based upon the dry weight of the mixture in order to produce a doughy paste therewith, kneading the doughy paste until some of the noncolloidal sulfur is changed to colloidal sulfur and the amount of the collaidal sulfur in the mixture has been increased, and thereafter drying the paste at a temperature below the fusing point of sulfur.

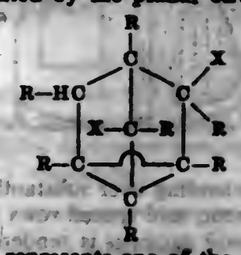
2,773,798

**METHOD OF PRODUCING FUSED BENTONITE-SULFUR HAVING A STABLE COLLOIDAL SULFUR CONTENT**

John F. Lee Venzie, Middleport, N. Y., assignor to Food Machinery and Chemical Corporation, San Jose, Calif.

Application August 23, 1951, Serial No. 243,305
1 Claim. (Cl. 167—20)

The method of producing fused bentonite sulfur having a relatively stable colloidal sulfur content upon aging, which comprises heating bentonite clay and sulfur in the proportions by weight of 4 parts bentonite clay to one part sulfur to one part bentonite clay to one part sulfur, at a temperature in the range 125° C. to 160° C. until fused bentonite sulfur is produced and then before the initial content of colloidal sulfur in the product so produced has decreased substantially, adding liquid water to the fused bentonite sulfur until there is produced therein a water content between about 5% and 18% based upon the dry weight of the fused bentonite sulfur, whereby the initial colloidal sulfur content of the fused bentonite sulfur is maintained at substantially its initial concentration.



2,773,799

**COMPOUNDS, PREPARATION AND FUNGICIDAL COMPOSITIONS OF POLYHALOGENO ALKYL POLYCYCLYL KETONES**

Hsing Yun Fan, Denver, Colo., assignor to Shell Development Company, New York, N. Y., a corporation of Delaware

No Drawing. Application November 2, 1953, Serial No. 389,857
44 Claims. (Cl. 167—30)

3. A polyhalogeno alkyl polycyclyl ketone having a structure represented by the planar structural formula

in which each X represents one of the class consisting of the group —CO—$CR_3$, hydrogen, and middle halogen, with the proviso that one, and only one, X represents the group —CO—$CR_3$, and each R is selected from the class consisting of hydrogen, middle halogen and lower alkyl, with the proviso that not less than two of the substituents represented by X and R together be halogen.

27. The method of controlling the growth of micro-organisms which comprises applying in the environment of the micro-organisms a product prepared by brominating a product of reaction of bicyclo(2.2.1)-2,5-pentadiene and acetyl chloride in the presence of a Friedel-Crafts catalyst.

2,773,800

**RABIES VACCINE PRODUCTION**

Horace M. Powell, Indianapolis, Ind., assignor to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

No Drawing. Application April 28, 1953, Serial No. 351,729
2 Claims. (Cl. 167—78)

1. The method of preparing a rabies vaccine which comprises infecting duck embryos with fixed rabies virus, incubating the eggs for a period of time, separating the embryo cell tissue from the eggs, and attenuating the rabies virus in said embryo tissue.

2,773,801

**DENTIFRICE COMPOSITIONS COMPRISING A NORMALLY-SOLID WATER SOLUBLE CONDENSATION PRODUCT OF ETHYLENE GLYCOL AND POLYPROPYLENE GLYCOL**

Arthur L. Fox, Short Hills, N. J., assignor to Colgate-Palmolive Company, a corporation of Delaware

No Drawing. Application July 3, 1952, Serial No. 297,171
4 Claims. (Cl. 167—93)

1. A dentifrice composition comprising a polishing material and about 0.1 to 10% by weight of a normally-solid water-soluble condensation product of ethylene oxide and polypropylene glycol, said product having a molecular weight of about 5,000 to about 10,000 and an ethylene oxide content of about 75–90% by weight.

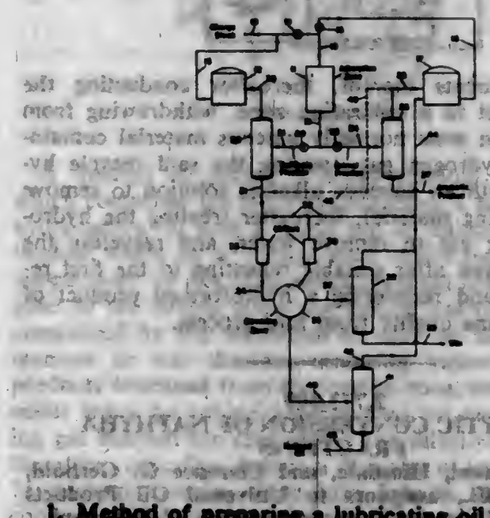
2,773,802

**ACID NEUTRALIZING ABRASIVE CHLOROPHYLL DENTIFRICE**

Benjamin Gruskin, deceased, late of Atlantic City, N. J., by Irma Kelly Gruskin, executrix, Atlantic City, N. J., assignor to Rytex Company, Mount Vernon, N. Y., a limited partnership

No Drawing. Application March 8, 1951, Serial No. 214,625
10 Claims. (Cl. 167—93)

1. An acid-stabilized dentifrice composition, substantially free of water-insoluble precipitated chlorophyll both



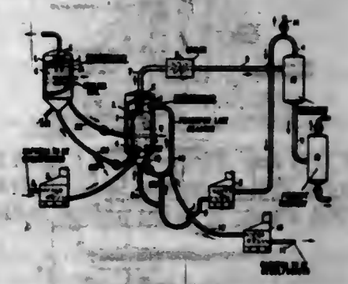
in storage and in use, therapeutically effective in the treatment of gingival conditions containing as essential ingredients an inorganic acid neutralizing salt of relatively low solubility in water and 0.02 to 3% by weight of a water soluble chlorophyll, said salt being in an amount sufficient to impart an abrasive action to said composition and at the same time to maintain the pH of said composition sufficiently high to maintain said water soluble chlorophyll in its water soluble and therapeutically effective form.

2,773,803

**COMBINATION ADSORPTION AND DEWAXING PROCESS**

James Van Dyck Fear, Media, and Arthur D. Moscrip, Swarthmore, Pa., assignors to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

Application October 22, 1954, Serial No. 464,064
12 Claims. (Cl. 196—18)



1. Method of preparing a lubricating oil having a low pour point and improved V. I. from a waxy lubricating oil stock which comprises diluting the stock with a saturate hydrocarbon diluent of the $C_3$–$C_6$ range, treating the diluted stock with silica gel to selectively adsorb aromatic constituents, displacing hydrocarbons from the silica gel by means of a liquid desorbing agent containing ethylene dichloride and obtained as hereinafter specified, obtaining from the silica gel treatment (1) a first raffinate fraction containing saturate components of said stock including wax in admixture with desorbing agent and saturate hydrocarbon diluent, and (2) an extract fraction containing aromatic components of said stock in admixture mainly with desorbing agent, distilling the first raffinate fraction to remove overhead a major portion of the diluent contained therein while recovering as bottoms a second raffinate fraction comprising saturate components of the charge together with substantially all the desorbing agent present in the first raffinate fraction, adding additional desorbing agent to the second raffinate fraction, regulating the distillation and the addition of desorbing agent so as to produce an admixture of a dewaxing solvent and charge saturates in which the ratio of the total solvent to charge stock components therein is within the range by volume of 1:1 to 6:1 and the total solvent composition conforms to the area ABCD of Fig. 2, cooling the admixture to a wax crystallizing temperature, separating wax from the cooled mixture, recovering solvent from the dewaxed oil and wax products, recovering desorbing agent from said extract fraction, and utilizing such recovered solvent in admixture with recovered desorbing agent as the said liquid desorbing agent.

2,773,804

**HYDROFORMING AND HYDRODESULFURIZING**

Roger W. Tate and Charles E. Hemminger, Westfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application December 24, 1953, Serial No. 400,233
6 Claims. (Cl. 196—28)

1. The method of hydroforming naphthas and at the same time desulfurizing a sulfur-containing naphtha, the last named naphtha also having a high degree of unsaturation, which comprises subjecting a naphtha to hydroforming conditions in the presence of a dense, fluidized bed having an upper dense phase level of a hydroforming catalyst and added hydrogen, in a hydroforming zone, under hydroforming conditions of temperature, pressure and contact time, withdrawing a portion of the hydroforming catalyst from said hydroforming zone and conducting it to a transfer line in communication with a lower point of said bed to receive catalyst therefrom and the upper end of said transfer line being in communication with an upper point in said hydroforming zone which line comprises a hydrodesulfurization zone, charging a naphtha having a high degree of unsaturation and also containing sulfur to the said hydrodesulfurization zone, contacting the last named naphtha with the catalyst and added hydrogen while in the form of a rapidly moving stream of the last-named naphtha and catalyst flowing concurrently upward formed by charging the last-named naphtha in vapor form to the said hydroforming zone at a lower point thereof, at a feed rate of from 10–30 pounds of naphtha per hour per pound of said withdrawn catalyst, maintaining hydrodesulfurization conditions in said line, withdrawing product from said line, charging it to the hydroforming zone and recovering from said hydroforming zone a combined product stream of improved quality.

2,773,805

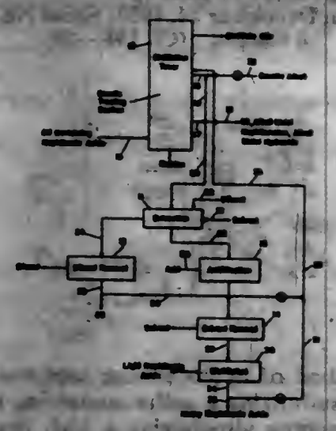
**DESULFURIZATION OF CRACKED NAPHTHAS WITH FORMALDEHYDE AND SODIUM**

Byron M. Vanderbilt, Westfield, and John P. Thorn, Elizabeth, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application February 1, 1954, Serial No. 407,592
4 Claims. (Cl. 196—28)

3. The process of refining a light petroleum distillate boiling in the motor fuel boiling range which comprises contacting said distillate with formaldehyde and then contacting the distillate in vapor phase with an alkali metal on a solid support.

2,773,806

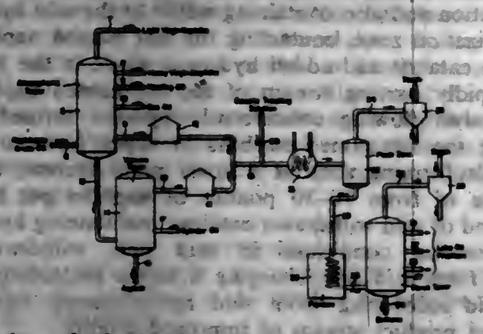


**REFINING HYDROCARBON OIL VAPORS WITH ALKALI AND HIGH BOILING NAPHTHENIC ACIDS**

Charles C. Kline, Wallingford, and Hugh L. Myers, Springfield, Pa., assignors to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

Application December 8, 1954, Serial No. 473,957
3 Claims. (Cl. 196—36)

1. Method for refining petroleum which comprises: contacting petroleum vapors with a liquid treating agent

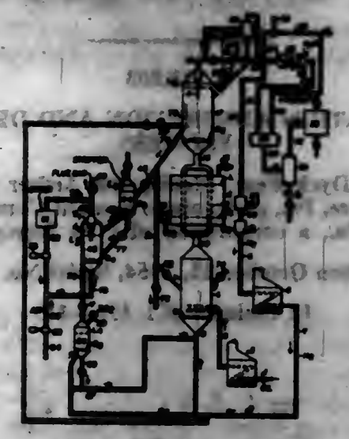


comprising alkali metal hydroxide in a refining zone, thereby to react naphthenic acids contained in said vapors with said hydroxide; periodically introducing free naphthenic acids in liquid phase into said refining zone, which

acids have average molecular weight higher than that of the first-named naphthenic acids, thereby to effect a cleaning of said refining zone by means of the latter naphthenic acids.

---

2,773,907
**REFINING NAPHTHENIC LUBE-OIL DISTILLATES WITH A EUTECTIC MIXTURE OF SODIUM HYDROXIDE AND POTASSIUM HYDROXIDE**
Leo J. Klotz, Cranford, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Application December 24, 1953, Serial No. 400,312
3 Claims. (Cl. 196—41)



1. A method of refining a lubricating oil distillate derived from the fractionation of a naphtenic crude oil, said distillate having a viscosity of at least 1100 SUS at 100° F., which comprises the steps of treating the distillate with a eutectic mixture of sodium hydroxide and potassium hydroxide in an amount at least about 0.06 percent by weight in excess of the amount of hydroxide required to neutralize the acidity of the distillate, and then redistilling the distillate in the presence of the added hydroxides.

---

2,773,908
**TWO STAGE FLUIDIZED HYDROFORMING**
Charles E. Hemminger, Westfield, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Application May 29, 1953, Serial No. 358,513
4 Claims. (Cl. 196—50)

1. In the hydroforming of naphthas, the improvement which comprises providing a first reaction zone containing a bed of fluidized platinum-containing catalyst having an average particle size suitable for fluidization, maintaining hydroforming conditions of temperature and pressure in said reaction zone, withdrawing the catalyst and gasiform material from the said first reaction zone, passing them through a reheating zone whereby they are heated to a temperature above that prevailing in the first reaction zone, thereafter passing the reheated materials to a second reaction zone maintained at a temperature higher than that in the first reaction zone, causing the catalyst in the said second reaction zone to form a well-fluidized bed, permitting the reactants to remain resident in the said second reaction zone for a sufficient period of time to effect the desired hydroforming reaction, withdrawing reaction vapors overhead from said second reaction zone, cooling the said reaction vapors to condense normally

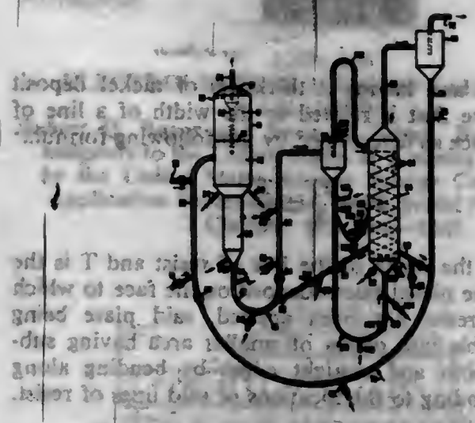
liquid constituents thereof, thereafter conducting the cooled product to a separation zone, withdrawing from said separation zone normally gaseous material containing recycle hydrogen gas, treating the said recycle hydrogen gas with an aqueous alkaline solution to remove sulfur-containing material, thereafter treating the hydrogen-containing gas to remove water, and recycling the treated hydrogen after suitable reheating to the first reaction zone, and recovering a hydroformed product of improved octane quality from said process.

---

2,773,909
**CATALYTIC CONVERSION OF NAPHTHA FRACTIONS**
Vladimir Haensel, Hinsdale, and Clarence G. Gerhold, Riverside, Ill., assignors to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
No Drawing. Application November 16, 1953, Serial No. 392,409
9 Claims. (Cl. 196—50)

1. A process which comprises separating a hydrocarbon reforming charge stock into a higher boiling fraction and a lower boiling fraction, reforming the lower boiling fraction in the presence of added hydrogen and a platinum-containing catalyst, separately reforming the higher boiling fraction in the presence of a platinum-containing catalyst of substantially the same composition as said first mentioned catalyst, but at a higher hydrogen partial pressure than utilized in the reforming of the lower boiling fraction, and subjecting the lower boiling fraction to an intensity of reforming conditions which is at least 10 times as great as the intensity of the reforming conditions to which the higher boiling fraction is subjected.

---

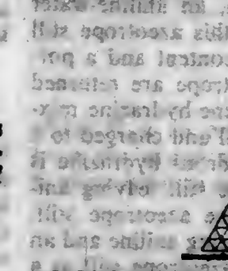


2,773,910
**HYDROFORMING CATALYST AND PROCESS**
Charles N. Kimberlin, Jr., and Elroy M. Gladrow, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware
No Drawing. Application October 31, 1952, Serial No. 318,067
8 Claims. (Cl. 196—50)

1. An improved hydroforming catalyst prepared by reacting aluminum with an anhydrous alcohol diluted with a hydrocarbon diluent to obtain an anhydrous aluminum alcoholate, admixing said alcoholate with an anhydrous peptizing agent and an aqueous solution of a heat decomposable zinc salt to obtain a slurry comprising a hydrous zinc-aluminum oxide complex, incorporating a hydroforming catalyst component with said complex, and drying the resulting composition.

---

2,773,911
**CONVERSION OF HYDROCARBONS**
Edward W. S. Nicholson, Baton Rouge, La., and Francis R. Russell, Mountainside, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware
Application September 16, 1953, Serial No. 380,407
1 Claim. (Cl. 196—55)



A method of coking a heavy residual hydrocarbon which comprises the steps of contacting a heavy residual hydrocarbon oil with a dense bed of fluidized coke particulate solids in a coking zone maintained at coking temperature by hot coke solids recycled from a burning zone to the coking zone, the coking reaction being accompanied by the deposition of coke on the solids and increase in size thereon; removing vaporous reaction products overhead from the coking zone; removing coke solids from the coking zone; passing an oxygen-containing gas through the coke solids and selectively removing therefrom coke fines having a diameter of less than about 75 microns; burning these coke fines in the form of a confined stream in the oxygen-containing gas; passing the residual coke particles having a particle diameter larger than about 75 microns and from which the fines have been removed to the lower portion of a packed burning zone; passing an oxygen-containing gas into said lower portion and through the burning zone to selectively burn substantially only particles having a diameter larger than about 400 microns and entrain particles having a diameter of about 50 to 400 microns; removing the thus heated 50 to 400 micron diameter particles entrained in gaseous products of combustion overhead from said burning zone; co-mingling the products of combustion from the coke fines burning step therewith; separating combustion gases from the combined stream and returning the remaining heated coking particles to said coking zone.

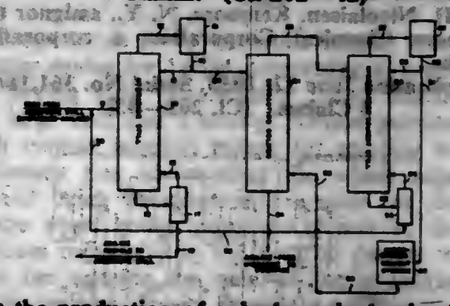
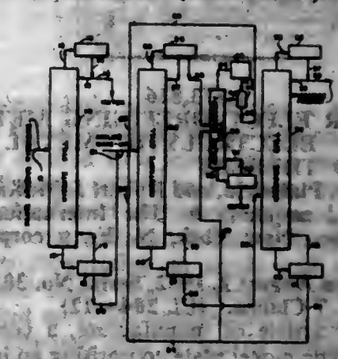
2,773,912
**WAX COMPOSITION**
John D. Tench, Prospect Park, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application May 18, 1954, Serial No. 430,547
3 Claims. (Cl. 196—149)



1. A new composition of matter comprising: (A) from 60 to 70 parts of a paraffin wax having a melting point of from about 125° F. to 142° F., a viscosity of about 35 to 42 SUS at 210° F., a refractive index at 212° F. of from 1.419 to 1.423 and an average molecular weight of from about 355 to about 400; (B) from 25 to 35 parts of a microcrystalline wax boiling above about 525° F. at 2 mm. mercury pressure, and having a melting point

of from about 185° F. to about 200° F., a viscosity at 210° F. of from about 81 to 89 SUS, a refractive index at 212° F. of from 1.435 to 1.438; and (C) from 2 to 10 parts of a lubricating oil having an API gravity of above 18 and an initial boiling point of above 600° F.

---



2,773,913
**EXTRACTION OF ANILINE FROM HYDRAZINE IN THE DEHYDRATION OF HYDRAZINE BY AZEOTROPIC DISTILLATION**
Bernard H. Nicolaisen, Kenmore, N. Y., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Application June 12, 1953, Serial No. 361,184
4 Claims. (Cl. 202—42)

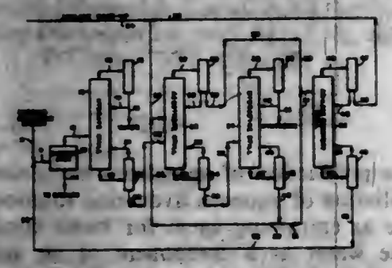
1. In the production of anhydrous hydrazine by azeotropic distillation of aqueous hydrazine solutions employing analine as entraining agent for water comprising removing the water as a component of an aniline-water azeotrope to leave an anhydrous hydrazine-aniline mixture and separating an aniline-contamisated anhydrous hydrazine from this mixture, the improvement which comprises contacting the aniline-contaminated anhydrous hydrazine with a selective hydrocarbon solvent for anilipe, separating a hydrazine phase and a hydrocarbon solvent phase, and stripping residual hydrocarbon solvent from the hydrazine phase.

---

2,773,914
**DEHYDRATION OF HYDRAZINE BY AZEOTROPIC DISTILLATION WITH ANILINE**
Bernard H. Nicolaisen, Kenmore, N. Y., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Application June 12, 1953, Serial No. 361,185
2 Claims. (Cl. 202—42)

1. In the production of anhydrous hydrazine by the azeotropic distillation of aqueous hydrazine solutions em-

ploying aniline as an entraining agent for water in which aniline and an aqueous solution of hydrazine are charged to an azeotrope still as feed material, an aniline-water azeotrope is removed overhead from this azeotrope still and the major portion of the aniline content and a portion of the water content of the azeotrope are returned to the azeotrope still as reflux, an aniline-hydrazine mixture is removed from the azeotrope still and charged to a hydrazine still, and substantially anhydrous hydrazine is removed overhead from this hydrazine still leaving aniline bottoms which are recycled to the azeotrope still; the improvement which comprises charging aniline and an aqueous solution of hydrazine to the azeotrope still as a feed material having a hydrazine-water mole ratio in the range of about 0.5:1 to about 2:1 and an aniline-hydrazine mole ratio in the range of about 3:1 to about 12:1, operating the azeotrope still at a reflux ratio in the range of 1.1:1 to 15:1, and recovering a substantially anhydrous hydrazine-aniline mixture from the azeotrope still as a bottoms product.



---

**2,773,815**

**RECOVERY OF ANILINE ENTRAINER IN DEHYDRATION OF HYDRAZINE BY AZEOTROPIC DISTILLATION**

**Bernard H. Nicolaisen, Kenmore, N. Y., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia**

**Application June 12, 1953, Serial No. 361,186**
**3 Claims. (Cl. 202—42)**

1. In the production of anhydrous hydrazine by the azetropic distillation of aqueous hydrazine solutions employing aniline as an entraining agent for water in which aniline and an aqueous solution of hydrazine are charged to a first still, an aniline-water azeotrope is removed overhead from this first still, the bottoms from the first still in the form of an aniline-hydrazine mixture are charged to a second still and substantially anhydrous hydrazine is removed overhead from this second still leaving aniline bottoms which are recycled to the first still; the improvement which comprises charging to a third still a minor portion of the aniline bottoms from the second still, distilling said minor portion in admixture with water, removing an aniline-water azeotrope overhead from this third still, passing this aniline-water azeotrope to the first still, and removing from the third still bottoms comprising water containing any non-volatile impurities charged to this third still.

**2,773,816**

**METHOD FOR ELECTROREFINING METAL AND IMPROVED ELECTROLYTIC METAL PLATES PRODUCED THEREBY**

**Andrew Wesley, Plainfield, and Robert J. McKay, Basking Ridge, N. J., assignors to The International Nickel Company, Inc., New York, N. Y., a corporation of Delaware**

**Application August 2, 1952, Serial No. 302,304**
**7 Claims. (Cl. 204—12)**

1. As a new article of manufacture, a composite dividable electrolytic nickel plate comprising an imperforate nickel starting sheet having a plurality of continuous lines of resist applied at corresponding locations on opposite faces thereof and extending across said faces, and an electrolytic nickel deposit upon said faces covering said

lines of resist and having a thickness of nickel deposit upon each face that is related to the width of a line of resist on the face as determined by the following formula:

$$W=\frac{2T}{3}\pm\frac{T}{10}$$

wherein W is the width of the line of resist and T is the thickness of the nickel electrodeposit on the face to which said line of resist has been applied, said plate being readily dividable into pieces of smaller area having substantially smooth and straight edges by bending along lines corresponding to the locations of said lines of resist.

---

**2,773,817**

**COMPOSITE METAL AND ARTICLES THEREOF**

**John James Russell, Des Plaines, William A. Beck, Ithaca, and Jack Kollman, Chicago, Ill., assignors to Elco Products Company, Chicago, Ill., a corporation of Illinois**

**No Drawing. Application December 18, 1952, Serial No. 326,768**
**11 Claims. (Cl. 204—37)**

1. A method of making a composite article comprising a composition of tin layer bonded to a metallic supporting base having surfaces outwardly disposed thereof, comprising the steps of subjecting the supporting base with metallic tin coating to anodic electrolytic oxidation in an electrolyte to form a tin oxide coating, removing the anodized article from the electrolyte, coating said oxide of tin coating with a stable high temperature organic releasing film, and then subjecting the coated article to an elevated temperature of about 150° C. to 400° C. in order to convert the oxide of tin to the green oxide of tin while curing the organic film.

**2,773,818**

**ALKALINE NICKEL PLATING SOLUTION**

**Paul W. Moy, Gates Mills, and Arthur H. Du Rose, Euclid, Ohio, assignors to The Harshaw Chemical Company, Cleveland, Ohio, a corporation of Ohio**

**No Drawing. Application May 20, 1954, Serial No. 431,274**
**5 Claims. (Cl. 204—49)**

1. An aqueous, alkaline nickel plating solution comprising a nickel compound of the class consisting of nickel chloride, nickel sulfate and mixtures thereof molecularly equivalent to 75 to 250 grams per liter of nickel sulfate hexahydrate, a complexing agent in concentration from 25 to 175 grams per liter, said complexing agent being a polyalkanoic acid derivative of a polyalkylene amine soluble in the solution, and a polyalkanol amine stabilizer present in concentration from 25 to 200 grams per liter, the pH of said solution being in the range from 6.5 to 12.

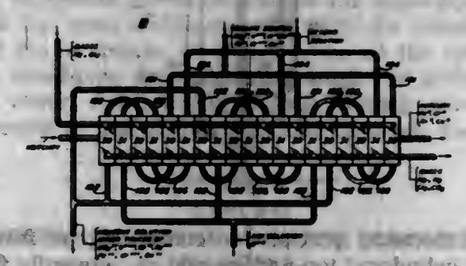
**2,773,819**

**ELECTRODEPOSITION OF LEAD**

**Louis Gianelos, Cleveland, Ohio, assignor to The Harshaw Chemical Company, Cleveland, Ohio, a corporation of Ohio**

**No Drawing. Application January 13, 1954, Serial No. 403,913**
**5 Claims. (Cl. 204—53)**

1. A lead fluoborate plating solution containing lead fluoborate, fluoboric acid and cooperating addition agents in amount sufficient to increase the covering power and suppress the formation of trees, one of said addition agents being aloin and the other thereof being dibenzene sulfonamide.



---

**2,773,820**

**ELECTROLYTIC PROCESS OF SALVAGING URANIUM**

**Robert Q. Boyer and Scott B. Kilner, Berkeley, Calif., assignors to the United States of America as represented by the United States Atomic Energy Commission**

**Application September 14, 1944, Serial No. 554,044**
**7 Claims. (Cl. 204—124)**

1. The process of concentrating uranium in solution by treatment in an electrolytic cell including anode and cathode compartments comprising passing at a relatively high rate of flow a first solution containing uranium and oxalate ions through the anode compartment of the electrolytic cell, passing at a relatively low rate of flow an acidic second solution through the cathode compartment of the electrolytic cell in ion transfer and non-intermixing relation with said first solution, and simultaneously subjecting the two solutions to electrolysis in the electrolytic cell to transfer said uranium ions from said first solution to said second solution and concentrate said uranium ions therein.

**2,773,821**

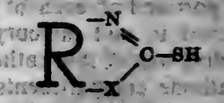
**COMPOSITION FOR USE IN ELECTROPOLISHING**

**George H. Smith, Buffalo, N. Y., assignor to Electro-Glaze, Inc., Buffalo, N. Y.**

**No Drawing. Application June 12, 1956, Serial No. 590,829**
**1 Claim. (Cl. 204—140.5)**

A solution for use in electropolishing metals of a group consisting of iron, aluminum, nickel and alloys thereof, said solution containing from 30 to 40 percent of orthophosphoric acid, 25 to 35 percent of sulphuric acid and 10 to 20 percent of hydroxyacetic acid, 5 to 25 percent of benzene sulphonic acid, 2 to 12 percent of toluene sulphonic acid and from 5 to 15 percent of water.

---



**2,773,822**

**PHOTOPOLYMERIZATION INITIATORS**

**Roland J. Kern, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware**

**No Drawing. Application September 24, 1953, Serial No. 382,209**
**17 Claims. (Cl. 204—158)**

1. In the photopolymerization of an ethylenically unsaturated monomer, the improvement which comprises employing a small amount of a compound having the general formula

where R is an ortho arylene radical and X is selected from the group consisting of S, O, and NH, effective to photosensitize said polymerization.

---

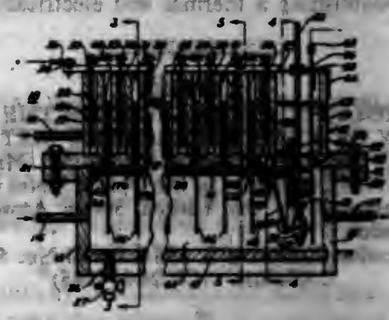
**2,773,823**

**SAFETY DEVICE FOR A NEUTRONIC REACTOR**

**John J. Geott, Chicago, Ill., assignor to the United States of America as represented by the United States Atomic Energy Commission**

**Application May 22, 1945, Serial No. 595,189**
**1 Claim. (Cl. 204—193)**

A safety device for a neutronic reactor comprising a projecting device for bodies comprising a conical rotary wheel having eight substantially radial blades, a head at the large end, and a storage portion provided with a smooth conical interior; means for rotating the wheel; a stationary ring surrounding the wheel adjacent the head and being provided with a gate for discharging from the wheel bodies propelled therein by the blades; and means responsive to the neutron density within the reactor for opening the gate of the projecting device when the neutron density exceeds a predetermined level.



---

**2,773,824**

**ELECTROLYTIC CELLS**

**Robert Q. Boyer, Berkeley, Calif., and Scott B. Kilner, Knoxville, Tenn., assignors to the United States of America as represented by the United States Atomic Energy Commission**

**Original application September 14, 1944, Serial No. 554,044. Divided and this application June 7, 1945, Serial No. 598,012**
**6 Claims. (Cl. 204—212)**

1. An electrolytic cell comprising a casing having a removable upper section provided with an apertured floor detachably secured to a lower casing section, a pool of mercury disposed within said casing, porous partitions defining a plurality of alternately disposed, separate anode and cathode compartments within said casing, a plurality of elements constituting an anode and respectively disposed in said anode compartments, a plurality of rotatably-mounted members constituting a cathode, said cathode being disposed with its greater surface beneath said floor and with its lesser surface extending through the floor into the upper casing section, portions of said members being immersed in said mercury pool and other por-

tions of said members being respectively disposed in said cathode compartments, means for rotating said members, whereby different portions of each of said members are successively immersed in said mercury pool and moved into the corresponding one of said cathode compartments, said anode and cathode compartments being adapted to contain an electrolyte in contact with said elements and said members and electrically communicating through said porous partition structure, first terminal structure commonly connecting together said elements, second terminal structure commonly connecting together said members, and conduit means for conducting gas into each of said anode compartments below the surface of said electrolyte therein, whereby said gas is dispersed through said electrolyte in said anode compartments.

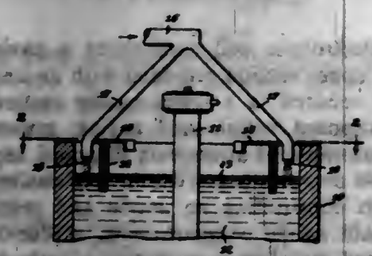
## ELECTROLYSIS APPARATUS

Frank A. Newcombe, Nutley, N. J., assignor to the United States of America as represented by the United States Atomic Energy Commission

Application April 28, 1944, Serial No. 533,110
2 Claims. (Cl. 204—243)

1. In apparatus for the recovery of uranium metal by electrodeposition thereof on a cathode insertable therein, the combination comprising a container, heat insulating material lining said container, a ring supported by said container, a rigid sleeve positioned in said insulating material and supported on said ring, an electrical heating coil surrounding said sleeve, a graphite crucible for receiving an electrolyte containing a uranium salt, said crucible being positioned in and spaced from said sleeve, graphite sealing means intermediate the sleeve and the crucible, a rod of conducting material projecting downwardly from said crucible to provide an anode connection for said crucible, and a cooling coil surrounding said rod and establishing a thermal and electrical connection therewith.



---

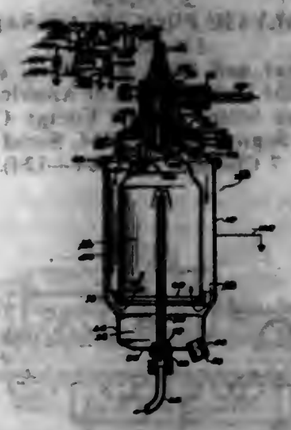
2,773,826

## ELECTROLYTIC APPARATUS FOR THE RECOVERY OF RARE REFRACTORY METALS

Norman C. Beese, Verona, and John W. Marden, East Orange, N. J., assignors to the United States of America as represented by the United States Atomic Energy Commission

Application February 7, 1944, Serial No. 521,410
2 Claims. (Cl. 204—245)

1. In apparatus for recovering a rare refractory metal by electrolysis, the combination comprising a crucible for containing a fused electrolyte, said crucible forming the anode of an electrolysis cell, a cathode electrode supported from above and extending into said crucible centrally thereof, and an electrically conducting shield positioned between the inner wall of said crucible and said electrode, said shield being electrically connected to said crucible to provide a space of substantially no electrical field between said shield and said crucible wall.



---

2,773,827

## ELECTRICAL PRECIPITATORS

John H. Roper, Philadelphia, Pa., assignor to Roper Associates, Inc., Philadelphia, Pa., a corporation of Delaware

Application August 8, 1952, Serial No. 303,307
5 Claims. (Cl. 204—305)

1. An electrical precipitator comprising an insulator having a cylindrical top portion and an outwardly flaring bottom portion; a metal cylinder having a top portion of smaller diameter than the main body portion of said cylinder with sloping sides connecting the two; means for fastening said top portion to the bottom of said insulator with the cylindrical portions of said insulator and said metal cylinder having a common axis; a metal shell surrounding said metal cylinder and having a cylindrical surface spaced from the cylindrical surface of said metal cylinder and arranged concentric therewith and projecting above the main body portion of said metal cylinder; said shell having walls tapering inwardly from the top of said cylindrical surface to the top portion of said insulator and conforming in shape substantially to the outwardly flaring portion of said insulator; a ring gasket disposed between the said outwardly flaring portion of said insulator and the inwardly tapering portion of said shell and having a diameter substantially the same as that of the cylindrical portion of said insulator; said shell having a cup-shaped bottom having inwardly projecting shoulders; an annular insulator resting on said shoulders and having means for engaging the bottom of said metal cylinder; said shell having top and bottom portions united by a crimp seam crimped to place said gasket under compression; inlet and outlet means for introducing and withdrawing a fluid into and from said shell and passageways therebetween for directing fluid to flow between said concentric surfaces in its passage from said inlet means to said outlet means; and an electrical conductor passing upwardly from said metal cylinder along the axis of first-named insulator to the top thereof.

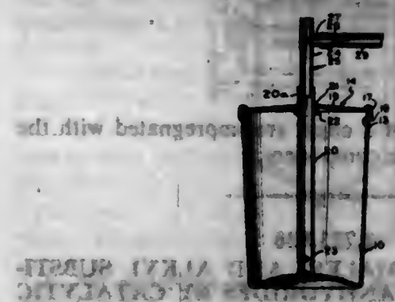
2,773,828

## BUBBLE ENERGIZED FILTER FOR AQUARIUM



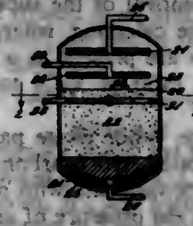
Dominic P. Schiavo, San Jose, Calif.

Application April 12, 1954, Serial No. 422,523
2 Claims. (Cl. 210—16)

1. In a filter for an aquarium wherein a flow of water is induced through a bed of filtering material by a stream of bubbles passing inwardly through the upright portion of a T-shaped tube fitting; a cup-shaped receptacle for

holding a supply of filtering material and for mounting in upright submerged condition in an aquarium, a cover having a plurality of perforations therein removably attached over the open upper end of the receptacle, an upright stand-pipe fitted into an opening in the cover for insertion through filtering material to the bottom of the receptacle, the upper end of the stand-pipe projecting above the cover for connection of the upright portion of a T-fitting thereto, and a projection on the stand-pipe

for engagement by the cover at a height to press the lower end of the stand-pipe into engagement with the bottom of the receptacle, the lower end of the stand-pipe being formed for open communication with the interior portion of the receptacle, whereby suction on the upper end of the stand-pipe draws water through the perforations in the cover, downwardly through filtering material in the receptacle and thence upwardly through the stand-pipe.



---

2,773,829

## PROCESS AND APPARATUS FOR SUBSURFACE WASHING

Ronald W. Hunting, Prospect Park, Pa.

Application January 11, 1954, Serial No. 403,168
5 Claims. (Cl. 210—24)

5. The process of washing a liquid treatment bed of particles of liquid treating medium following a service phase of the cycle in which liquid to be treated is passed downwardly through the bed, which comprises introducing liquid whirling in one direction on a generally vertical axis at a level beneath and adjacent to the surface of said bed, concurrently introducing a relatively smaller volume of liquid forcefully from a plurality of distributed stationary jets directed generally tangentially in the opposite direction, said introduced liquid being withdrawn upwardly through said bed without disturbing the bottom, thereby locally backwashing the upper portion of the bed.

---

2,773,830

## SUBSURFACE WASHING OF BED

Harold Charlton Farmer, Wynnewood, and Vincent E. Burgess, Morton, Pa.

Application January 11, 1954, Serial No. 403,414
1 Claim. (Cl. 210—24)

The process of ion exchange in water containing finely divided material in suspension, using a bed of particles of ion exchange medium, which comprises passing downwardly, through the ion exchange bed during a service phase of the cycle, said water having constituents characterized by a tendency to agglomerate said particles, and subsequently introducing wash water forcefully in streams from a plurality of jets at a level beneath and adjacent the surface of the bed entirely horizontally and thereby causing agglomerates to settle into the path of the jets and by the impact of the streams breaking

up the agglomerates, and simultaneously carrying off the wash water and fine suspended material upwardly through the top of the bed.

---

2,773,831

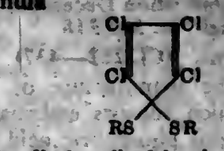
## INHIBITING CORROSION BY OIL WELL FLUIDS

Samuel E. Jolly, Ridley Park, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

No Drawing. Application December 30, 1954, Serial No. 478,909
4 Claims. (Cl. 252—8.55)

1. Method for inhibiting corrosion of ferrous metal by oil well fluids which comprises: introducing into normally corrosive oil well fluids, which come into contact with ferrous metal, a material selected from the group consisting of petroleum naphthenyl amines, and salts thereof.

---



2,773,832

## REACTION PRODUCT OF HEXACHLOROCYCLOPENTADIENE WITH THIOL COMPOUNDS AND LUBRICANTS CONTAINING SAME

Ellis K. Fields, Chicago, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application November 28, 1952, Serial No. 323,141
2 Claims. (Cl. 252—48.8)

1. A mineral lubricating oil and between about 0.2 and about 20% by weight, based on said oil, of a compound having the formula

wherein R is an alkyl radical having from 1 to 18 carbon atoms, inclusive.

---

2,773,833

## NON-CAKING ALKYL ARYL SULFONATE DETERGENT COMPOSITIONS

Allen H. Lewis and Richard D. Stayner, Berkeley, Calif., assignors to California Research Corporation, San Francisco, Calif., a corporation of Delaware

No Drawing. Application September 14, 1951, Serial No. 246,705
8 Claims. (Cl. 252—138)

1. A substantially non-caking, solid, particulate detergent composition consisting essentially of a mixture of (*a*) a detergent material containing in each 100 parts thereof from 10 to 95 parts by weight of a sodium salt of a monoalkyl benzene sulfonic acid having from 9 to 18 carbon atoms in the alkyl chain, the remainder of said detergent being essentially an inorganic sodium salt builder, and (*b*) from about 0.5% to about 10% by weight based on the entire composition of a sulfonate material selected from the group consisting of sodium benzene monosulfonate and sodium toluene monosulfonate; said composition being in the form of substantially non-caking, dry particles of substantially uniform composition obtained by drying an aqueous dispersion containing said components (*a*) and (*b*) of said composition.

2,773,834

## SHAMPOO COMPOSITIONS CONTAINING MONOMETHYLOL DIMETHYL HYDANTOIN

Hyman Hoskin, Bayside, N. Y., assignor to Colgate-Palmolive Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application September 21, 1953, Serial No. 381,509
5 Claims. (Cl. 252—152)

1. A shampoo composition comprising at least about 5% by weight of an organic detergent selected from the group consisting of sulfated and sulfonated detersive salts in an aqueous medium which is normally subject to bacterial and mold growth and a minor proportion up to about 1% of 1-methylol 5,5-dimethyl hydantoin sufficient to inhibit said growth.

2,773,835

## LIQUID SHAMPOO COMPOSITION

Albin Fritjof Anderson, Allendale, N. J., assignor to Colgate-Palmolive Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application November 16, 1951, Serial No. 256,845
7 Claims. (Cl. 252—153)

1. A liquid shampoo composition characterized by having improved resistance to phase separation on long standing which comprises about 5 to 45% by weight of a water-soluble salt of a sulfated monoglyceride of higher fatty acids as a detergent, from about 0.5 to about 25% of urea, and the balance being water, said shampoo having a pH within the range of 5.5 to 7.0.

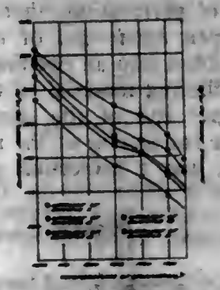
2,773,836

## OXIDE-PROMOTED TITANIUM-PHOSPHORUS CATALYST

Harold Shalit, Drexel Hill, Pa., and Arthur P. Lien, Highland, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application December 1, 1952, Serial No. 323,518
15 Claims. (Cl. 252—437)

1. A process for the manufacture of a solid, self-supporting catalyst which consists essentially of mixing a substantially anhydrous phosphoric acid selected from the group consisting of orthophosphoric and pyrophosphoric acids, a titanium halide selected from the group consisting of the chlorides and bromides of titanium in an atomic ratio of halogen to active hydrogen in said acid between about 0.4:1 and 1:1, and a promoter in a concentration between about 0.5 and 20 percent by weight based on said acid, said promoter being selected from the class consisting of groups V and VI metallic oxides having hydrogenation-dehydrogenation properties, and heating the resulting mixture at a temperature above about 175° C. until evolution of hydrogen halide therefrom substantially ceases and approximates the theoretical quantity of hydrogen halide.



2,773,837

## ALUMINA-CHROMIA-PHOSPHORUS PENTOXIDE CATALYST AND METHOD FOR PREPARING THE SAME

Carlos L. Gutzeit, Woodbury, and William H. Lang, Wenonah, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application September 30, 1953, Serial No. 383,163
6 Claims. (Cl. 252—437)

1. A catalytic composite consisting essentially of 20 to 40 percent by weight of chromia, 50 to 80 percent by weight alumina, and 0.2 to 10 percent by weight of phosphorous pentoxide, wherein the chromia and alumina com-

ponents in the form of a cogel are impregnated with the phosphorous pentoxide component.

2,773,838

## PRODUCTION OF MALEIC AND ALKYL SUBSTITUTED MALEIC ANHYDRIDES BY CATALYTIC OXIDATION

John C. Reid, Wynnewood, and Norman C. Sidebotham, Drexel Hill, Pa., assignors to The Atlantic Refining Company, Philadelphia, Pa., a corporation of Pennsylvania

Application May 1, 1951, Serial No. 224,004
2 Claims. (Cl. 252—437)

1. A method of producing dicarboxylic acid anhydrides selected from the group consisting of maleic anhydride or alkyl substituted maleic anhydrides which comprises reacting the vapor of a non-aromatic, unsaturated hydrocarbon containing at least 4 carbon atoms with a free oxygen-containing gas at a temperature ranging between 800° F. to 1000° F. in the presence of a catalyst prepared by reacting ammonium meta-vanadate with phosphoric acid in an aqueous solution in the presence of an inert carrier followed by removal of the supernatant liquid by evaporation, drying the calcining, wherein oxygen, vanadium, and phosphorus are present in a proportion corresponding to a weight ratio of $V_2O_5$ to $P_2O_5$ within the range of 3:2 and 1:2.

2. A catalyst for the vapor phase partial oxidation of non-aromatic, unsaturated hydrocarbons prepared by reacting ammonium meta-vanadate with phosphoric acid in an aqueous solution in the presence of an inert carrier followed by removal of the supernatant liquid by evaporation, drying, and calcining, wherein oxygen, vanadium, and phosphorus are present in a proportion corresponding to a weight ratio of $V_2O_5$ to $P_2O_5$ within the range of 3:2 and 1:2.

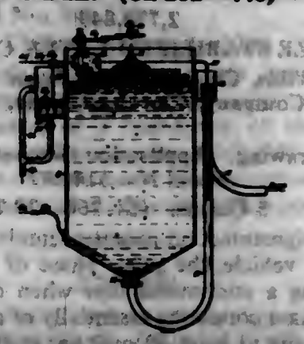
2,773,839

## METHOD OF HYDROGEL PREPARATION

William A. Stover and Robert C. Wilson, Jr., Woodbury, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application December 14, 1950, Serial No. 201,537
14 Claims. (Cl. 252—448)

1. A process for producing an all-embracing hydrogel having as its major solid components the oxides of aluminum and chromium present in an amount of at least about 10 percent by weight, which comprises intimately mixing in concentration sufficient to insure said amount an aqueous solution of an alkali metal aluminate having an alkali metal to aluminum ratio designated as R of not less than about 1 and not more than about 1.5 and an aqueous solution of a chromium salt, the anion of which forms a complex with chromium, having a ratio of said anion to chromium of at least about 1 and not more than about 4R–2.4 to yield a hydrosol characterized by an inherent capacity to set to a hydrogel upon lapse of a suitable period of time.



2,773,840

## OPERATION OF HYDROGEL BEAD-FORMING TOWER

Robert D. Drew, Wenonah, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York

Application September 19, 1952, Serial No. 310,432
9 Claims. (Cl. 252—448)

1. An apparatus for forming generally spheroidal hydrogel pellets comprising a vertical liquid chamber, distributing means for introducing hydrosol in the form of small globules into the liquid in said chamber, an inlet to admit liquid into said chamber, an outlet to withdraw liquid and formed hydrogel pellets from the bottom of said chamber and means for injecting a gas into said outlet below the surface of the mixture of liquid and hydrogel pellets contained therein.

5. A process for the manufacture of spheroidal pellets of inorganic oxide hydrogel, which comprises forming a gelable hydrosol of inorganic oxide, permitting said sol to fall in the form of globules through a body of water-immiscible liquid and set to a firm hydrogel therein, the gelation time of said sol and the depth of said body of liquid being so correlated that gelation will occur therein, removing a stream of said water-immiscible liquid and formed hydrogel pellets from said body and injecting an inert gas into said stream in an amount sufficient to lower the density of said stream and to result in continued flow thereof from said body.

2,773,841

## METHOD OF PREPARING SILICA ALUMINA OR MAGNESIA BASE CATALYSTS

Charles N. Kimberlin, Jr., and Elroy M. Gladrow, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application December 24, 1952, Serial No. 327,904
15 Claims. (Cl. 252—449)

15. A process for preparing hydrocarbon conversion catalysts which comprises preparing magnesia hydrosol, subjecting the said hydrosol to pressures from about 15 to 1000 lbs. per sq. inch gauge and temperatures from about 212 to about 550° F. for periods of from a few minutes up to about 24 hours to lower the surface area and increase the pore volume of gels obtainable therefrom, cooling the pressure treated hydrosol, depressuring the cooled hydrosol, converting the pressure treated hydrosol to hydrogel, impregnating the resultant magnesia hydrogel with an active catalytic component and heating or calcining the resultant composite to activate the same.

2,773,842

## HYDROFORMING CATALYSTS AND METHOD

Charles N. Kimberlin, Jr., and Elroy M. Gladrow, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application December 22, 1952, Serial No. 327,489
6 Claims. (Cl. 252—455)

1. A catalyst manufacturing process which comprises subjecting hydrous aluminum oxide in the absence of extraneous water in a reaction zone to an elevated pressure in the range of 15 to 1000 p. s. i. g. and a temperature in the range of 212° to 550° F., and drying said aluminum oxide by releasing steam from said reaction zone while maintaining said elevated pressure whereby a catalyst of substantially increased pore volume and diameter is obtained.

2,773,843

## TREATING SILICA MAGNESIA MATERIALS

Charles N. Kimberlin, Jr., and Elroy M. Gladrow, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application April 21, 1954, Serial No. 424,762
7 Claims. (Cl. 252—457)

3. A process for increasing the surface area and the pore volume of hydrous silica magnesia catalyst particles containing a major proportion of silica which comprises subjecting hydrous silica magnesia catalyst particles to a pressure between about 200 and 800 p. s. i. g. and a temperature between about 350° and 600° F. for a period about 0.25 and 4 hours in a confined zone, then drying the silica magnesia catalyst particles by heating said confined zone to maintain the selected temperature and pressure and permitting continuous slow escape of water vapor from said confined zone to maintain the desired pressure for a period between about 1 and 6 hours until the silica magnesia catalyst particles are substantially dry and then cooling and removing the treated and dry silica-magnesia catalyst particles from said confined zone.

2,773,844

## METHOD FOR MAKING SUPPORTED SILVER CATALYSTS

George J. Carlson and Clarence R. Gunn, Berkeley, Calif., assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Application June 12, 1953, Serial No. 361,416
4 Claims. (Cl. 252—463)

1. In the process for the production of a silver catalyst composition wherein aqueous silver nitrate is combined with an inert porous solid support in a total amount which upon reduction provides a concentration of from about 2 to about 15% by weight of metallic silver in said catalyst composition, and said silver nitrate is reduced to metallic silver on said support, the steps which comprise combining with said support only a fraction of said total amount of said aqueous silver nitrate, reducing said silver nitrate combined with said support to metallic silver by heating at a temperature of from about 150 to about 400° C. in a reducing atmosphere, combining the resulting silver metal-containing composition with the remainder of said total amount of said aqueous silver nitrate, and reducing said silver nitrate additionally combined with said silver metal-containing support to metallic silver by again heating at a temperature of from about 150 to about 400° C. in a reducing atmosphere, thereby obtaining a silver catalyst containing from 2 to 15% metallic silver having a greater activity for the ethylene oxidation reaction than a similar catalyst containing the same amount of silver prepared by reducing silver nitrate upon the support but in the absence of a reduction of a part of the silver nitrate to elemental silver before a subsequent impregnation with a further amount of silver nitrate.

2,773,845

## TREATMENT OF CHROMIA-ALUMINA HYDROGEL

William A. Stover, Putnam, and Robert C. Wilson, Jr., Woodbury, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application July 30, 1952, Serial No. 301,672
8 Claims. (Cl. 252—465)

1. In the production of a chromia-alumina co-gel prepared by mixing aqueous solutions of sodium aluminate

and chromium acetate to yield a hydrosol having a chromia-alumina content of at least about 10 percent by weight and controlling the sodium to aluminum ion ratio and the acetate to chromium ion ratio in said solutions to effect rapid gelation of said hydrosol to a hydrogel and water-washing and drying the resulting hydrogel, the improvement which comprises aging said hydrogel, before said washing, for at least 2 hours in an alkaline medium having a pH between 8.0 and 9.5.

---

2,773,846

## ALUMINA-CHROMIA-MOLYBDENA CATALYST

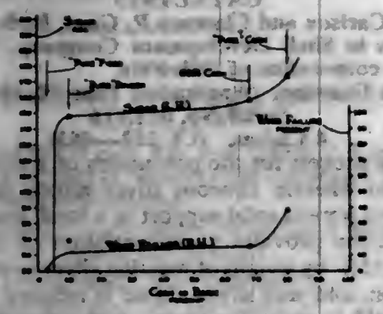
William A. Stover, Pitman, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York

Application June 13, 1952, Serial No. 293,412

2 Claims. (Cl. 252—465)

1. A catalytic composite consisting essentially of 10 to 30 percent by weight of chromia, 50 to 89 percent by weight alumina, and 1 to 20 percent by weight of molybdena, having chromia and alumina components intimately combined in the form of a dried hydrogel, which hydrogel is impregnated with the molybdena component.

---



2,773,847

## BARK COMPONENTS AS RESIN INGREDIENTS

Robert D. Pusey, Tacoma, Wash., assignor to Weyerhaeuser Timber Company, Tacoma, Wash., a corporation of Washington

Application May 4, 1954, Serial No. 427,580

10 Claims. (Cl. 260—17.2)

5. A process for making a resin comprising dissolving a basic reacting compound in water, adding a bark component separated from the bark of a coniferous tree and containing at least about 68% of cork, stirring the mixture until the heat of reaction is dissipated and the bark component is dispersed and dissolved, adding to the reaction mixture a phenolic compound selected from the group consisting of phenol, cresol and xylenol, adding an aldehyde selected from the group consisting of formaldehyde and paraformaldehyde, and reacting the resulting mixture to produce a resin.

---

2,773,848

## RESINOUS COMPOSITIONS

Richard Lindenfelser, Darien, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 21, 1953, Serial No. 399,600

19 Claims. (Cl. 260—17.3)

1. A composition of matter comprising a thermosetting product of reaction of ingredients comprising (*a*) an aldehyde and (*b*) a monomeric amidogen compound containing not less than two amidogen groupings each having at least one hydrogen atom attached to the amidogen nitrogen atom, said reaction product being modified with alpha alkyl-D-glucoside wherein the alkyl group contains from 1 to 4 carbon atoms and said glucoside being present in an amount varying between about 10% to about 30% by weight based on the total weight of said reaction product.

---

2,773,849

## FREEZE STABILIZED LATEX COATINGS

Victor M. Willis, Chicago, Ill., assignor to The Sherwin-Williams Company, Cleveland, Ohio, a corporation of Ohio

No Drawing. Application October 10, 1952, Serial No. 314,207

5 Claims. (Cl. 260—29.7)

1. In a pigmented oil-in-water emulsion type coating composition vehicle, the solids phase of which is capable of depositing a continuous film when dry, containing a dispersed phase consisting essentially of an emulsion polymer containing at least 40 mol per cent of a monovinyl aromatic compound of the benzene series having a single center of unsaturation and between 33 and 60 mol per cent of an aliphatic conjugated diolefine of the class consisting of butadiene and isoprene in chemical combination and a continuous aqueous phase, the improvement which comprises including in the aqueous phase thereof at least 6 parts and not more than 10 parts per hundred parts of latex solids by weight of said emulsion polymer and from 1% to not more than about 5% by weight of the total aqueous phase of a water soluble alkaline salt of an asymmetrical, polysubstituted phenate, wherein said polysubstituents are limited to chlorine and phenyl groups.

---

2,773,850

## FORTIFIED EMULSION PAINTS CONTAINING A ZIRCONYL COMPOUND

Victor M. Willis, Chicago, Ill., assignor to The Sherwin-Williams Company, Cleveland, Ohio, a corporation of Ohio

No Drawing. Application December 20, 1952, Serial No. 327,156

6 Claims. (Cl. 260—29.7)

1. In an oil-in-water emulsion coating composition characterized by a dispersed oil phase capable of depositing stet films, a continuous water phase and a minor proportion of at least one surface active agent of the anionic class and a pH greater than 7, the improvement which includes the addition of a quantity of a water soluble ionizable, non-pigmentary, non-refractory inorganic ammonium salt of zirconium equivalent to not more than about ten pounds of $ZrO_2$ per 100 gallons of the emulsion paint product.

---

2,773,851

## VINYL PLASTIC TILE AND METHOD OF MAKING THE SAME

Leo L. Tolman, Manor Township, Lancaster County, Pa., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

No Drawing. Application December 22, 1952, Serial No. 327,417

4 Claims. (Cl. 260—30.6)

1. A plastic tile composition comprising about 60% to about 80% filler and about 20% to about 40% by weight of a binder including a vinyl chloride resin having an intrinsic viscosity in cyclohexanone at 20° C. of between about 0.53 and about 0.79, a resin selected from the group consisting of coumarone resins and hydrocarbon resins, said resin having a ring and ball softening point between about 95° C. and about 105° C., a resinous dihydric alcohol-dicarboxylic acid condensation product, and a plasticizer.

2,773,852

## PRODUCTION OF ANTI-STATIC PLASTICS

Richard G. Rowe, Redding Ridge, and Gailes Flower, Jr., Darien, Conn., assignors to Dictaphone Corporation, Bridgeport, Conn., a corporation of New York

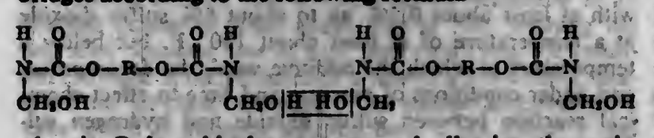
No Drawing. Original application December 9, 1950, Serial No. 200,094. Divided and this application March 5, 1953, Serial No. 340,672

9 Claims. (Cl. 260—32.6)

1. An anti-static plastic adapted to be used in the production of phonograph records, said plastic being essentially composed of a copolymer of vinyl chloride and vinyl acetate and containing from 2% to 10% by weight of a mono-alkanol amide of a straight-chain monocarboxylic hydroxy acid as an anti-static agent.

---

2,773,853



## METHOD OF PRODUCING STOVING LACQUERS FROM DIMETHYLOL DERIVATIVE OF A DIURETHANE

Adolf Weihe, Kronberg, Taunus, Germany, assignor to Herbig-Haarhaus Aktiengesellschaft Lackfabrik Koln-Bickendorf, Koln-Bickendorf, Germany, a firm

No Drawing. Application May 27, 1952, Serial No. 290,311

9 Claims. (Cl. 260—33.2)

1. Process for producing a resin to be utilized as a stoving lacquer, comprising preparing an aqueous solution of a dimethylol derivative of a diurethane, mixing said solution with at least a single organic solvent as an azeotropic agent, adjusting the mixture to an acidic pH value, subjecting the mixture to azeotropic distillation to dehydrate the mixure and form methylene ether bridges according to the following formula

wherein R is a bivalent group, and allowing the resin formed to dissolve in said solvent.

---

2,773,854

## PLASTICIZED RUBBER COMPOSITIONS

Arthur B. Hersberger, Drexel Hill, and John C. Reid, Wynnewood, Pa., assignors to The Atlantic Refining Company, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Original application April 4, 1949, Serial No. 85,475, now Patent No. 2,698,288, dated December 28, 1954. Divided and this application July 1, 1953, Serial No. 365,560

1 Claim. (Cl. 260—33.6)

A composition comprising a butadiene-styrene rubber and from 2 percent to 25 percent of a plasticizing and softening agent produced by contacting gas oil with a silica-alumina catalyst at a temperature ranging between 850° F. and 950° F. to crack the gas oil, separating from the cracked hydrocarbons, catalyst and heavy residual oil having an A. P. I. gravity between 10° and 18°, a distillation range of 100° F. to 650° F. at 3 mm. pressure, and a Saybolt Universal viscosity at 210° F. of 30 to 60 seconds, distilling said heavy residual oil at subatmospheric pressures to produce the desired residue having a specific gravity at 60° F. between 1.10 and 1.30, a softening point between 180° F. and 210° F., a penetration at 77° F. of about 2, a penetration at 115° F. of about 4, a flash point of at least 600° F., a Furol viscosity at 325° F. between 30 and 60 seconds and aniline point below 70° F.

2,773,855

## COMPOSITIONS FOR DECORATIVE PURPOSES

Jerome Hochberg, Newburgh, and Silvio A. Pellerano, Brooklyn, N. Y., assignors to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York

No Drawing. Application October 7, 1952, Serial No. 313,614

6 Claims. (Cl. 260—33.8)

1. A liquid composition containing an active component adapted to be dispersed in aerosol form and a propellant agent; said active component constituting from about 5% to about 25% by weight of said composition and comprising a normal butyl-isobutyl methacrylate copolymer in amount at least 2% by weight of said composition, and a paratertiary butyl phenol-formaldehyde oil soluble thermosetting resin about 50% soluble at about room temperature in a liquid mixture containing by weight 76% $CH_3CCl_2F_2$—16% $CCl_2F_2$—8% $CCl_3F$, said resin being present in amount at least 3% by weight of said composition; said active component being incorporated in said propellant agent, which is a normally gaseous chlorofluorocarbon containing not more than two carbon atoms, held under sufficient pressure to maintain the same in the liquid phase.

---

2,773,856

## TREATMENT OF SYNTHETIC POLYMERIC MATERIALS TO IMPART DYE AFFINITY THERETO

Robert Meyer, Tassin-la-Demi-Lune, and Pierre Alphonse Garnier, Lyon, France, assignors to Societe des Usines Chimiques Rhone-Poulenc

No Drawing. Application March 3, 1952, Serial No. 274,672

Claims priority, application Great Britain March 12, 1951

5 Claims. (Cl. 260—79.3)

1. A method of treating an acrylonitrile polymer, which material may be formed into filaments and the like and which has substantially no affinity for acid dyestuffs, to confer upon the product an affinity for acid dyestuffs when in the solid state, which method comprises heating said polymer in solution with a hydrocarbon sulphonic acid and a hydrocarbon amine selected from the class consisting of those primary and secondary aliphatic and alicyclic amines containing not more than 10 carbon atoms in the molecule, the combined quantity of amine and sulphonic acid being not less than 23% and not greater than 75% of the weight of the polymer, and removing the solvent of the said solution to form a solid composition of the said polymer, amine and sulphonic acid.

---

2,773,857

## 1,4-DISUBSTITUTED-2-CYANO-1,3-BUTADIENES

Burt Carlton Pratt, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application July 23, 1953, Serial No. 369,971

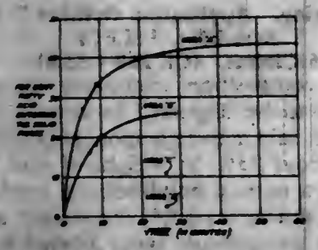
13 Claims. (Cl. 260—88.5)

1. A 2-cyano-1,3-butadiene carrying on the 4-carbon a single monovalent, lower aliphatic hydrocarbon radical and on the 1-carbon a single monovalent organic radical of no more than 7 carbons.

---

2,773,858

## METHOD OF PREPARING EXPANDED UREA



Manuel H. Gorin and Ludwig Rozenstein, San Francisco, Calif.

Application March 27, 1950, Serial No. 152,178

1 Claim. (Cl. 260—96.5)

A process for making expanded urea in the form of a light and fluffy powder having a bulk density of less than substantially 0.5 gram per cubic centimeter, which comprises first preparing a urea adduct by reacting urea at room temperature with an organic compound from the group consisting of linear hydrocarbons and fatty acids

containing a linear paraffinic chain of at least seven carbon atoms, removing the solid phase by filtration, washing the solid phase with warm hexane, suspending the resulting adduct in a solvent for the organic compound

but a non-solvent for urea, decomposing the adduct by heating the suspension to a temperature below about 115° C. and above about 40° C. for a time between 5 minutes and 90 minutes, and then separating the resulting expanded urea.

2,773,859

## ROSIN POLYMERIZATION PROCESS

Alfred L. Rummelsburg, Chadds Ford, Pa., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application December 29, 1951, Serial No. 264,243
10 Claims. (Cl. 260—99.5)

1. The process of polymerizing rosin materials of the group consisting of rosin, rosin esters, and esters of rosin alcohols which comprises polymerizing the rosin material in the presence of sulfuric acid catalyst at a temperature of about 12° to about 18° C. until the product has a drop softening point of at least 90° C., adding to the reaction mixture a modifying agent of the group consisting of saturated acyclic aldehydes containing not more than three carbon atoms in the aldehyde chain; unsaturated acyclic aldehydes containing not more than four carbon atoms in the aldehyde chain; aldehyde polymers; monoesters, monethers, and ether-esters of gem-diols; and gem-diethers and gem-diesters, wherein the oxygen atoms are attached to acyclic carbon atoms, said aldehyde polymers, monoethers, monoesters, ether-esters, gem-diethers and gem-diesters being derived from an aldehyde selected from the group consisting of said saturated acyclic aldehydes and said unsaturated acyclic aldehydes, and continuing the reaction.

2,773,860

## PROCESS OF STABILIZING PHOSPHORUS SULFIDE-OXYGEN-CONTAINING ORGANIC COMPOUND REACTION PRODUCTS AGAINST LIBERATION OF HYDROGEN SULFIDE

John M. Musselman, Brecksville, Ohio, assignor to The Standard Oil Company, Cleveland, Ohio, a corporation of Ohio

No Drawing. Application December 30, 1955, Serial No. 556,459
6 Claims. (Cl. 260—125)

1. A process of stabilizing phosphorus sulfide-oxygen-containing organic compound additives against generation of hydrogen sulfide which comprises treating the additive separately with at least 0.1% up to about 1% potassium hydroxide and with at least about 0.5% up to about 5% sulfur dioxide at a temperature of at least about 150° F. but below a temperature at which the additive would be decomposed, and under conditions of pressure and time to effect chemical reaction between the potassium hydroxide and the sulfur dioxide and hydrogen sulfide-producing components of the additive and produce an additive which has a sulfur content less than about 1.5% higher than that of the starting additive and which meets the requirements of the hydrogen sulfide stability test.

2,773,861

## PROCESS OF STABILIZING PHOSPHORUS SULFIDE-OXYGEN CONTAINING ORGANIC COMPOUND REACTION PRODUCTS AGAINST HYDROGEN SULFIDE EVOLUTION

John M. Musselman, Brecksville, Ohio, assignor to The Standard Oil Company, Cleveland, Ohio, a corporation of Ohio

No Drawing. Application December 30, 1955, Serial No. 556,458
4 Claims. (Cl. 260—125)

1. A process of stabilizing phosphorus sulfide-oxygen-containing organic compound additives against generation of hydrogen sulfide which comprises treating the additive with a sulfite in an amount to supply at least about 0.5% up to about 5% sulfur dioxide at a temperature of at least about 150° F. but below a temperature at which the additive would be decomposed, and under conditions of pressure and time to effect chemical reaction between the sulfite and hydrogen sulfide-producing components of the additive and produce an additive which has a sulfur content less than about 1.5% higher than that of the starting additive and which meets the requirements of the hydrogen sulfide stability test.

2,773,862

## PROCESS OF STABILIZING PHOSPHORUS SULFIDE-OXYGEN-CONTAINING ORGANIC COMPOUND REACTION PRODUCTS

John M. Musselman, Brecksville, Ohio, assignor to The Standard Oil Company, Cleveland, Ohio, a corporation of Ohio

No Drawing. Application December 30, 1955, Serial No. 556,460
4 Claims. (Cl. 260—125)

1. A process of stabilizing phosphorus sulfide-oxygen-containing organic compound additives against generation of hydrogen sulfide which comprises treating the additive with at least about 0.5% up to about 5% sulfur dioxide at a temperature of at least about 150° F. but below a temperature at which the additive would be decomposed, and under conditions of pressure and time to effect chemical reaction between sulfur dioxide and hydrogen sulfide-producing components of the additive and produce an additive which has a sulfur content less than about 1.5% higher than that of the starting additive and which meets the requirements of the hydrogen sulfide stability test.

2,773,863

## MONOAZO-DYESTUFFS

Hans Bolliger, Basel, Switzerland, assignor to Ciba Limited, Basel, Switzerland, a Swiss firm

No Drawing. Application January 25, 1954, Serial No. 406,087
Claims priority, application Switzerland January 28, 1953
7 Claims. (Cl. 260—162)

1. A monoazo dyestuff free from sulfonic and carboxylic acid groups which corresponds to the formula

$$R_1\text{—}N{=}N\text{—}R_2\text{—}SO_2\text{—}NH\text{—}acyl$$
$$|$$
$$SO_2\text{—}(NH)_{n-1}\text{—}R\text{—}X$$

wherein $R_1$ represents a benzene radical, $R_2$ represents the radical of a 5-pyrazolone bound to the azo linkage in 4-position, $n$ represents a whole number up to and including two, R represents an alkyl radical of two carbon atoms which bears the substituent X in $\beta$-position, and X represents a hydroxyl group esterified by a benzene sulfonic acid.

2,773,864

## COUPLING ASSISTANTS FOR POLYAZO DYES

William W. Williams and Ludwig Richter, Easton, Pa., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application April 19, 1952, Serial No. 283,243
9 Claims. (Cl. 260—181)

1. In the process of producing polyazo dyes in substance, the step which comprises coupling an aryl diazo azo compound with a coupling component in solution in aqueous alkaline-to-neutral medium, in the presence of 2-methyl-5-ethyl pyridine amounting to 1% to 25% of the coupling component solution.

2,773,865

## VAPOR DRYING OF CELLULOSE

Earl Ralph Purchase, Waynesboro, Va., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application December 14, 1951, Serial No. 261,757
16 Claims. (Cl. 260—229)

13. A process for the removal of moisture due to water from raw cellulose concurrently with the supply of acetic acid thereto which comprises contacting the cellulose with a stream of air which has been dried to a low humidity by passage through a column of concentrated sulfuric acid and mixed with vapors of acetic acid by passage of the said air through a column of acetic acid.

2,773,866

## PRETREATMENT AND ESTERIFICATION OF CELLULOSE

Lejaron Arthur Hiller, Jr., and Fenton Hendy Swezey, Waynesboro, Va., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application January 31, 1952, Serial No. 269,344
19 Claims. (Cl. 260—229)

10. A process for the production of a cellulose ester which is saponifiable to an acetone-soluble form which comprises comingling cellulose with an aqueous solution of a strong mineral acid to effect depolymerization to an average degree of from about 200 to 700, washing the degraded cellulose free of acid, and esterifying the resultant cellulose in the presence of a non-depolymerizing catalyst from the class consisting of the sodium and potassium salts which in aqueous solution have a pH above 7 and an activating organic medium therefor.

2,773,867

## PROCESS FOR DEHALOGENATING STEROIDS

Percy L. Julian, Oak Park, and Jerome G. Klein, Niles, Ill., assignors to The Glidden Company, Cleveland, Ohio, a corporation of Ohio

No Drawing. Application May 17, 1954, Serial No. 430,441
14 Claims. (Cl. 260—239.47)

1. The process which comprises treating a solution of a steroid selected from the class consisting of 5α,6β-dichloro steroids of the allopregnane series, 5,6-dibromo steroids of the allopregnane series, 5,6-dibromo steroids of the pregnane series and 16-bromo-17α-hydroxy-$\Delta^5$ pregnenes with hydrogen in the presence of a catalyst selected from the class consisting of Raney nickel and palladium on an alkaline earth metal carbonate until the 5, 6 and 16 halogen substituents are removed.

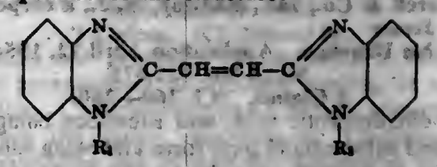
2,773,868

## STEROID KETAL

Eugene J. Agnello and Gerald D. Laubach, Jackson Heights, N. Y., assignors to Chas. Pfizer & Co., Inc., Brooklyn, N. Y., a corporation of Delaware

No Drawing. Application May 10, 1954, Serial No. 428,824
1 Claim. (Cl. 260—239.55)

The 20-ethylene ketal of allo-7-pregnene-3β-ol-20-one acetate.



2,773,869

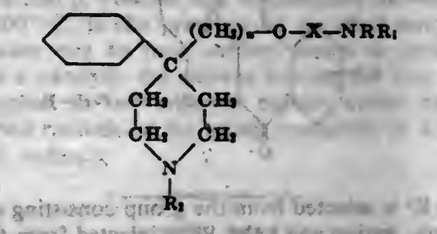
## ALKENYL BISIMIDAZOLE OPTICAL BLEACHING AGENTS

Julian Jacob Leavitt, Plainfield, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application June 21, 1954, Serial No. 438,351
3 Claims. (Cl. 260—240)

1. Compounds of the structure:

in which $R_1$ is allyl and $R_2$ is chosen from the group consisting of hydrogen and allyl.



2,773,870

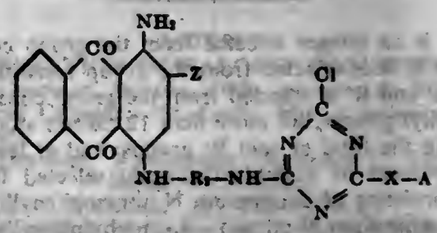
## 1-(LOWER ALKYL)-4-PHENYL-4-(TERTIARY-AMINOALKOXYMETHYL- AND TERTIARY-AMINOALKOXY) PIPERIDINES AND THEIR PREPARATION

Bill Elpern, Albany, N. Y., assignor to Sterling Drug Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application June 4, 1953, Serial No. 359,637
17 Claims. (Cl. 260—247.7)

1. A member of the group consisting of a compound having the formula

where $n$ is selected from the group consisting of zero and one, X is a lower alkylene radical having from 2 to 4 carbon atoms whose two free valence bonds are on different carbon atoms, $NRR_1$ is a member of the group consisting of lower dialkylamino, 1-piperidyl, (lower alkylated)-1-piperidyl, 1-pyrrolidyl, (lower alkylated)-1-pyrrolidyl and 4-morpholinyl, and $R_2$ is a lower alkyl radical and its acid addition and di-quaternary ammonium salts.



2,773,871

## DYESTUFFS OF THE ANTHRAQUINONE SERIES

Jakob Brassel, Basel, Alfred Fasciati, Bottmingen, and Arthur Buchler, Rheinfelden, Switzerland, assignors to Ciba Limited, Basel, Switzerland, a Swiss firm

No Drawing. Application August 13, 1954, Serial No. 449,782
Claims priority, application Switzerland August 20, 1953
9 Claims. (Cl. 260—249)

1. An anthraquinone dyestuff of the formula

in which $R_2$ represents a benzene radical, Z represents a member of the group consisting of a sulfonic acid group and a hydrogen atom, A represents a member of the group consisting of benzene cyclohexyl and alkyl radicals of at most 12 carbon atoms and X represents a member of the group consisting of, an oxygen atom and an

—NH— group, one of the radicals $R_2$ and A containing as sole water-solubilizing substituent a sulfonic acid group when Z represents a hydrogen atom.

---

2,773,872

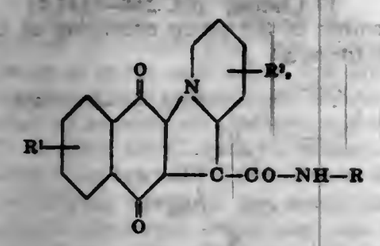
## DIHYDROOROTIC ACID

Charles S. Miller, Lansdale, Edward L. Engelhardt, Ambler, and Janice T. Gordon, Ardmore, Pa., assignors to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey

No Drawing. Application April 12, 1954, Serial No. 422,671
2 Claims. (Cl. 260—260)

1. D-dihydroorotic acid, said substance being in crystalline and substantially pure form and being substantially free from its optical antipode.

---



2,773,873

## HETEROCYCLIC VAT DYESTUFFS

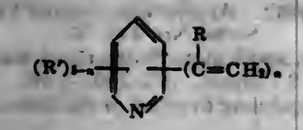
David I. Randall, Easton, Pa., and Wilhelm Schmidt-Nickels, Little York, N. J., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 28, 1954, Serial No. 478,174
10 Claims. (Cl. 260—272)

1. A compound having the formula

wherein $R^1$ is selected from the group consisting of hydrogen, nitro-, amino and halo; $R^2$ is selected from the group consisting of lower alkyl and halo; R is an anthraquinonyl radical; and y has a value of 0 to 3.

---



2,773,874

## STABILIZATION OF POLYMERIZABLE HETEROCYCLIC NITROGEN COMPOUNDS

Paul S. Hudson, Mack F. Potts, and Warren L. Smith, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application November 7, 1952, Serial No. 319,414
16 Claims. (Cl. 260—290)

4. A composition comprising a vinyl substituted pyridine selected from the class having the structural formula

where *n* is an integer selected from the group consisting of 1 and 2, R is selected from the group consisting of H and $CH_3$, and R′ is selected from the group consisting of H and alkyl groups, not more than 12 carbon atoms being present in the total of said R′ groups; and at least 0.001 weight percent of a stabilizing agent selected from the group consisting of ammonium N-nitrosophenylhydroxylamine, ammonium N-nitroso - 4 - methylphenylhydroxylamine, ammonium N-nitroso-2,6-dinitrophenylhydroxylamine, ammonium N-nitroso-2-hydroxy-4-chlorophenylhydroxylamine, ammonium N-nitroso-2,6-dinitro-4-chlorophenylhydroxylamine, ammonium N-nitroso-2-methoxy-4-aminophenylhydroxylamine, and ammonium N-nitroso-3-ethoxyphenylhydroxylamine.

2,773,875

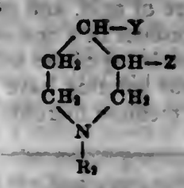
## INDOLE DERIVATIVES AND METHOD FOR PRODUCING SAME

Jacob Finkelstein, East Paterson, and John Lee, Essex Fells, N. J., assignors to Hoffmann-La Roche Inc., Nutley, N. J., a corporation of New Jersey

No Drawing. Application March 28, 1952, Serial No. 279,255
10 Claims. (Cl. 260—293)

1. A process which comprises reacting the sodium salt of ethyl β-(2-pyridyl)ethylacetoacetate with diazotized aniline so as to produce ethyl α-keto-γ-(2-pyridyl)butyrate phenylhydrazone, heating the latter in the form of its hydrochloride in the presence of sulfuric acid to produce ethyl 3-(2-pyridylmethyl)-2-indolecarboxylate, saponifying the hydrochloride of the last mentioned compound to produce 3 - (2 - pyridylmethyl) - 2 - indolecarboxylic acid, decarboxylating the latter in the presence of copper to produce 3-(2-pyridylmethyl)indole, reacting the last mentioned compound with a methylating quaternizing agent to produce the corresponding 2-(3-indolylmethyl) 1-methylpyridinium salt, and catalytically reducing the latter to produce 3-(1-methyl-2-piperidylmethyl)-indole.

---



2,773,876

## TERTIARY - AMINOALKOXYMETHYL - 1-(LOWER ALKYL) PIPERIDINES AND PREPARATION THEREOF

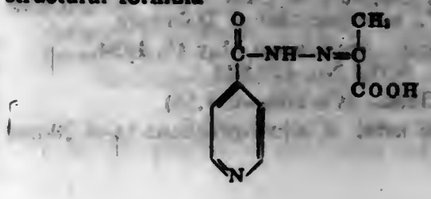
Bill Elpern, Albany, N. Y., assignor to Sterling Drug Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application June 4, 1953, Serial No. 359,638
17 Claims. (Cl. 260—294.7)

1. A member of the group consisting of a compound having the formula

where $R_2$ is a lower alkyl radical and one of Y and Z is hydrogen and the other is tertiary-aminoalkoxymethyl radical having the formula $-CH_2-O-X-NRR_1$ where X is a lower alkylene radical having from 2 to 4 carbon atoms whose two free valence bonds are on different carbon atoms and $NRR_1$ is a member of the group consisting of di-(lower alkyl) amino, 1-piperidyl, (lower alkylated)-1-piperidyl, 1-pyrrolidyl, (lower alkylated)-1-pyrrolidyl and 4-morpholinyl, and its acid addition and di-quaternary ammonium salts.

---



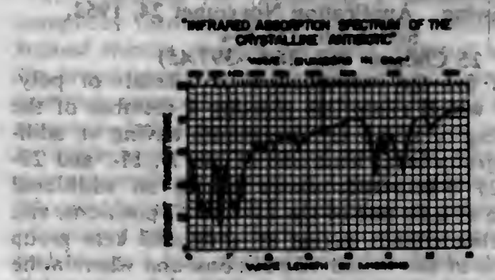
2,773,877

## ISONICOTINYL HYDRAZONE OF PYRUVIC ACID

Wilhelm Wenner, Upper Montclair, N. J., assignor to Hoffmann-La Roche Inc., Nutley, N. J., a corporation of New Jersey

No Drawing. Application March 14, 1952, Serial No. 276,705
1 Claim. (Cl. 260—295)

The isonicotinyl hydrazone of pyruvic acid having the structural formula



2,773,878

## CYCLOSERINE AND PRODUCTION THEREOF

Gilbert M. Shull, Roslyn Heights, N. Y., John B. Routien, Teaneck, N. J., and Alexander C. Finlay, Flushing, N. Y., assignors to Chas. Pfizer & Co., Inc., Brooklyn, N. Y., a corporation of Delaware

Application March 5, 1952, Serial No. 274,924
5 Claims. (Cl. 260—307)

5. Cycloserine, an amphoteric substance effective in inhibiting the growth of mycobacteria, which is highly soluble in water and slightly soluble in methanol and which contains the elements carbon, hydrogen, nitrogen, and oxygen in the following proportions:

| | Percent |
|---|---|
| Carbon | 35.3 |
| Hydrogen | 5.9 |
| Nitrogen | 27.4 |
| Oxygen (by difference) | 31.4 |

which has a positive optical rotation in methanol and a suspension of which in mineral oil exhibits characteristic absorption in the infrared region of the spectrum at the following frequencies expressed in reciprocal centimeters: 1626, 1602, 1580, 1557, 1534, 1408, 1402, 1266, 1227, 1168, 1141, 1117, 1064, 938, 916, 892, 880, and 830.

---

2,773,879

## GLYOXALIDINE SALTS OF LONG CHAIN DICARBOXYLIC ACIDS

Aaron Sterlin, Chicago, Ill., assignor to National Aluminate Corporation, Chicago, Ill., a corporation of Delaware

No Drawing. Application April 2, 1952, Serial No. 280,197
7 Claims. (Cl. 260—309.6)

1. Salts of an organic aliphatic dicarboxylic acid containing at least 10 carbon atoms in a hydrocarbon structure and a glyoxalidine wherein the carbon atom in the 2-position is linked to a higher aliphatic hydrocarbon group containing at least 8 carbon atoms, the carbon atom in the 4-position is linked to a member from the group consisting of hydrogen and lower aliphatic hydrocarbon groups containing not more than 6 carbon atoms, the carbon atom in the 5-position is linked to a member from the group consisting of hydrogen and lower aliphatic hydrocarbon groups containing not more than 6 carbon atoms, there being at least one hydrogen atom on each of the carbon atoms in the 4- and 5-positions, and the nitrogen atom in the 1-position is linked to a member from the group consisting of hydrogen and lower aliphatic groups containing not more than 6 carbon atoms, said last named lower aliphatic groups being composed of atoms from the group consisting of hydrogen, carbon, nitrogen and oxygen.

2,773,880

## PROCESS FOR PRODUCING 4-SUBSTITUTED 1,2-DIARYL-3,5-DIOXO PYRAZOLIDINES

Josef Ctvrtnik, Olomouc, Oldrich Nemecek, Prague, and Jiri Mayer, Brno, Czechoslovakia, assignors to Synfarma, narodni podnik, Hostivar, Czechoslovakia, a company of Czechoslovakia

No Drawing. Application September 23, 1955, Serial No. 536,276
Claims priority, application Czechoslovakia September 29, 1954
7 Claims. (Cl. 260—310)

1. Process for producing 4-substituted 1,2-diphenyl-3,5-dioxo pyrazolidines, comprising heating, in an alkaline medium, 1,3-dichlorobutene-2 with a compound selected from the group consisting of 1,2-diphenyl-3,5-dioxo pyrazolidine and its malonic component, and treating the obtained diphenyl dioxo pyrazolidine, substituted in the 4-position by at least a single gamma-chlorocrotyl group, with reducing agents.

---

2,773,881

## GLYCOL CARBONATES

Jesse T. Dunn, Charleston, W. Va., assignor to Union Carbide and Carbon Corporation, a corporation of New York

No Drawing. Application February 9, 1953, Serial No. 335,987
11 Claims. (Cl. 260—340.2)

1. Process for making glycol carbonates which comprises reacting an oxirane with carbon dioxide at a pressure above 500 p. s. i. and at a temperature between 100° C. and 400° C. in the presence of an alkyl amine containing from one to four carbon atoms in each alkyl radical as a catalyst; the oxirane having the ring oxygen atom attached to two adjacent carbon atoms to which are attached radicals of the group consisting of hydrogen and alkyl radicals.

---

2,773,882

## PROCESS FOR PREPARING 3-HALOFURAN

William W. Levis, Jr., Wyandotte, Mich., assignor, by mesne assignments, to The Pennsylvania Salt Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application May 7, 1952, Serial No. 286,621
17 Claims. (Cl. 260—346.1)

1. A process for preparing 3-halofuran of the group consisting of 3-chlorofuran and 3-bromofuran which comprises mixing at least one base of the group consisting of alkali metal and alkaline earth bases with at least one salt of the group consisting of alkali metal and alkaline earth salts of exo - cis - 4,5 - dihalo-3,6-endoxohexahydrophthalic acids, the halogen atoms of said salts being selected from the group consisting of chlorine and bromine, and maintaining said reactants in mutual contact at a temperature above about 100° C. until 3-halofuran has been produced.

---

2,773,883

## PREPARATION OF HALOBENZOQUINONES

Van R. Gaertner, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application November 27, 1953, Serial No. 394,285
8 Claims. (Cl. 260—396)

7. The method of preparing 2-chloro-5,8-dihydro-6-methyl-1,4-naphthoquinone, which method comprises dehydrochlorinating, by reaction with γ-collidine, 2,4a-dichloro - 6 - methyl - 4a,5,8,8a - tetrahydro - 1,4 - naphthoquinone having an angular hydrogen atom in the 8a-position in cis-relationship to the chlorine atom in the 4a-position.

2,773,884

## PROCESS FOR THE MANUFACTURE OF COMPOUNDS OF THE STEROID SERIES

Leopold Ruzicka, Hans Heusser, and Oskar Jeger, Zurich, Switzerland, assignors to Ciba Pharmaceutical Products, Inc., Summit, N. J.

No Drawing. Application December 29, 1952, Serial No. 328,505
Claims priority, application Switzerland April 4, 1952
2 Claims. (Cl. 260—397.2)

1. A process for the manufacture of $\Delta^{8:9:22,23}$-3$\beta$-lower alkylcarbonyloxy-7-keto ergostadiene, which comprises the step of treating mono keto $\Delta^{22:23}$-3$\beta$-lower alkylcarbonyloxy-8:9-oxido-ergostene, the keto group of which is in the 7-position, with zinc and an acid.

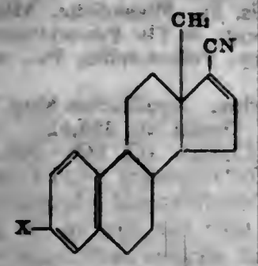
2,773,885

## STEROIDS OF THE ERGOSTA SERIES

Gerald D. Laubach, Jackson Heights, and Eric C. Schreiber, Hicksville, N. Y., assignors to Chas. Pfizer & Co., Inc., Brooklyn, N. Y., a corporation of Delaware

No Drawing. Application July 15, 1953, Serial No. 368,199
14 Claims. (Cl. 260—397.2)

12. Compounds selected from the class consisting of ergosta-6,8,22-triene-11-one-3$\beta$,14-diol, its 3-acetate, 3-propionate and 3-butyrate esters, and its 3-methyl, 3-ethyl and 3-benzyl ethers.



2,773,886

## DERIVATIVES OF 3-HYDROXY-17-CYANO-$\Delta$1,3,5(10),16-ESTRATETRAENE

Leon Velluz and Georges Muller, Paris, France, assignors to Les Laboratoires Francais de Chimiotherapie, Paris, France, a body corporate of France

No Drawing. Application August 24, 1954, Serial No. 451,952
Claims priority, application France January 2, 1948
3 Claims. (Cl. 260—397.5)

1. As a new product, a derivative of 3-hydroxy-17-cyano-$\Delta^{1,3,5,16}$-estratetraene of the following formula

wherein X is an acyloxy group, the acyl residue of said acyloxy group being selected from the group consisting of the unsubstituted lower aliphatic carboxylic acid radical, the cyclopentane carboxylic acid radical, the cyclohexane carboxylic acid radical, and the benzoic acid radical.

2,773,887

## PREGNANE-11$\alpha$.17$\alpha$-DIOL-3,20-DIONES, ESTERS THEREOF AND PROCESS

George Rosenkranz, Mexico City, Mexico, and Carl Djerassi, Birmingham, Mich., assignors, by mesne assignments, to Syntex S. A., Mexico City, Mexico, a corporation of Mexico

No Drawing. Application February 17, 1953, Serial No. 337,431
Claims priority, application Mexico February 19, 1952
6 Claims. (Cl. 260—397.45)

1. A process for the production of a compound selected from the group consisting of a pregnan-11$\alpha$,17$\alpha$-diol-3,20-dione lower fatty acid esters thereof and benzoic acid esters thereof which comprises treating a corresponding $\Delta^{16}$-pregnen-3,11$\alpha$-diol-20-one compound with hydrogen peroxide in alkaline medium to produce the corresponding 16$\alpha$,17$\alpha$-oxido derivative and thereafter converting the 16$\alpha$,17$\alpha$-oxido group to a 17$\alpha$-hydroxy group and the 3-hydroxy group to a 3-keto group.

2,773,888

## PROCESS FOR THE MANUFACTURE OF 3-KETALS OF POLYKETO STEROIDS AND PRODUCTS OBTAINED THEREBY

Eugene P. Oliveto, Bloomfield, and Emanuel B. Hershberg, West Orange, N. J., assignors to Schering Corporation, Bloomfield, N. J., a corporation of New Jersey

No Drawing. Application November 24, 1952, Serial No. 322,354
25 Claims. (Cl. 260—397.45)

1. Process for the manufacture of 3-ketals of polyketosteroids, which comprises reacting a member of the class consisting of (1) 3-keto-pregnanes having an additional keto group in at least one of the 7-, 11-, and 20-positions, (2) 3-keto-androstanes having an additional keto group in at least one of the 11- and 17-positions, and (3) 3-keto etiocholanes having an additional keto group in at least one of the 7- and 12-positions, and wherein the 3-keto group is in each case non-conjugated to a double bond, with a saturated lower aliphatic alcohol in the presence of selenium dioxide.

2,773,889

## PROCESS FOR THE EXTRACTION OF FATTY OILS AND PROTEINS FROM OLEAGINOUS MATERIALS

Wilson S. Kao, Singapore, Straits Settlement

No Drawing. Application November 29, 1951, Serial No. 259,004
4 Claims. (Cl. 260—412)

1. The process of treating an oleaginous material selected from the group consisting of coconut, groundnut, candlenut, soybean, cottonseed and rubber seed, which comprises extracting a flaked form of the selected material with a 0.5 to 1.5% aqueous soap solution at an elevated temperature of at least 70° C. but not exceeding the coagulation temperature of the proteins of the material, maintaining said elevated temperature for at least half an hour to thereby form a temporary oil-in-water emulsion containing proteins and carbohydrates with fibrous and insoluble material, separating the fibrous and insoluble material from the emulsion and then separating the oil from the proteins and carbohydrates.

2,773,890

## CATALYTIC CARBON MONOXIDE HYDROGENATION WITH AN INCREASED YIELD OF HIGHER BOILING ESTERS

Walter Rottig, Oberhausen-Sterkrade-Nord, Germany, assignor to Ruhrchemie Aktiengesellschaft, Oberhausen-Holten, Germany, and Luigi Gesellschaft fuer Waermetechnik m. b. H., Frankfurt am Main Heddernheim, Germany

No Drawing. Application April 2, 1952, Serial No. 280,171
Claims priority, application Germany April 11, 1951
9 Claims. (Cl. 260—449.6)

1. In a process for the catalytic hydrogenation of carbon monoxide, the improvement which comprises contacting a carbon monoxide hydrogen-containing synthesis gas with a precipitated iron hydrogenation catalyst containing at least 30% copper, based on the total iron present in said catalyst, and a free alkali content of about 4 to 15% calculated as $K_2O$, based on the total iron present in said catalyst, at a pressure of at least 5 atmospheres and temperatures of 170 to 280° C., and recovering oxygen-containing products having a high content of esters.

2,773,891

## PREPARATION OF ISOPHTHALONITRILES AND TEREPHTHALONITRILES

William G. Toland, Jr., San Rafael, and Joseph A. Fuller, Richmond, Calif., assignors to California Research Corporation, San Francisco, Calif., a corporation of Delaware

Application June 1, 1953, Serial No. 358,848
5 Claims. (Cl. 260—465)

1. A process for producing a phthalonitrile, which comprises forming an ammonia gas stream having entrained therein at least one solid material selected from the group consisting of isophthalic acid, terephthalic acid and their ammonium salts, monoamides and diamides, the ammonia being present in an amount of at least three equivalents per equivalent of said solid material, passing said ammonia gas stream at a space velocity below about 10 and above about 0.5 calculated as grams of feed/cc. of catalyst per hour through a catalytic conversion zone containing a bed of finely divided fluidizable solid particles of a dehydration catalyst to maintain the bed in fluid, turbulent condition, maintaining a temperature within about the range of 700° F.–900° F. in said conversion zone to convert the entrained material in the ammonia gas stream into volatile products, including the phthalonitrile, withdrawing said volatile products along with ammonia gas from the conversion zone, and recovering the phthalonitrile.

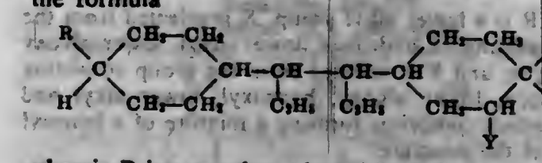
2,773,892

## 1-AMINO-1-HALO-2,2-DICYANOETHYLENES AND PREPARATION OF SAME

Ernest L. Little, Jr., Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 31, 1955, Serial No. 512,273
6 Claims. (Cl. 260—465.5)

1. A compound of the class consisting of 1-amino-1-halo-2,2-dicyanoethylenes.



2,773,893

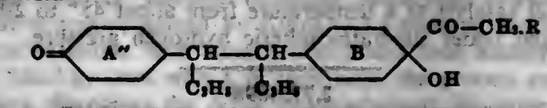
## CARBOXYLIC ACIDS OF THE DICYCLOHEXYL ETHANE SERIES, AND A PROCESS OF MAKING SAME

Erich M. H. Radde, New York, N. Y.

No Drawing. Application November 20, 1953, Serial No. 393,503
Claims priority, application Germany December 2, 1949
7 Claims. (Cl. 260—488)

1. An $\alpha$,$\beta$-substituted diethyl ethane compound of the formula

wherein R is a member selected from the group consisting of the hydroxyl group and an acyloxy group, while Z is a member selected from the group consisting of hydrogen and a hydroxyl group, and Y is a member selected from the group consisting of hydrogen and, together with Z, a double bond between the two carbon atoms to which said Y and Z are attached.



2,773,894

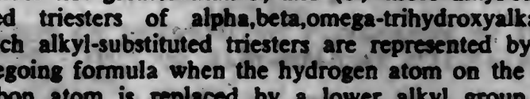
## DI-CYCLOHEXYL ETHANE COMPOUNDS, AND A PROCESS OF MAKING SAME

Erich M. H. Radde, New York, N. Y.

No Drawing. Application November 20, 1953, Serial No. 393,504
Claims priority, application Germany December 2, 1949
5 Claims. (Cl. 260—488)

1. An $\alpha$,$\beta$-substituted diethyl ethane compound of the formula

wherein R is a member selected from the group consisting of a hydroxyl group and an acyloxy group and wherein ring A" is a ring selected from the group consisting of the cyclohexane ring and the cyclohexene ring while ring B is the cyclohexane ring.



2,773,895

## PREPARATION OF ALPHA, OMEGA-GLYCOL ESTERS

Seaver A. Ballard and Richard R. Whetstone, Orinda, Calif., assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Application October 1, 1953, Serial No. 383,685
10 Claims. (Cl. 260—491)

10. A process for the preparation of a monocarboxylic acid diester of a non-vinylic alpha,omega-alkenediol, which comprises pyrolyzing a triester selected from the group consisting of (*a*) triesters of trihydroxyalkanes having the formula

in which each R represents a hydrocarbon group containing up to 18 carbon atoms and *n* represents an integral number not greater than 5, and (*b*) those alkyl-substituted triesters of alpha,beta,omega-trihydroxyalkanes, which alkyl-substituted triesters are represented by the foregoing formula when the hydrogen atom on the beta carbon atom is replaced by a lower alkyl group and from none to one, inclusive, hydrogen atom on a different non-terminal carbon atom of the linear carbon chain of the residue of the unsubstituted alpha-beta-omega-trihydroxyalkane is replaced by a lower alkyl group as the only additional substituent and R and *n* are defined as hereinbefore.

2,773,896

## MANUFACTURE OF ALKYL ARYL SULFONATES

James W. Putt, Los Angeles, Calif.

Application April 24, 1952, Serial No. 284,041
21 Claims. (Cl. 260—505)

1. A process of producing anionic surface-active compounds which comprises simultaneously alkylating and sulfonating a mixture of aromatic hydrocarbons having a boiling range within the limits from substantially 390° F. to substantially 600° F., with an olefin in the presence of sulfuric acid in a single reaction zone; agitating the reaction mixture in said single reaction zone until alkylation and sulfonation are substantially completely effected, adding water to the reacted mixture in amounts and under conditions controlled to effect layer separation of free sulfuric acid, unsulfonated oil and alkyl aryl sulfonic acid, separating the layers, recovering the alkyl aryl sulfonic acid and neutralizing the sulfonic acid with basic material to form the corresponding alkyl aryl sulfonates.

2,773,897

## PREPARATION OF METHYLSUCCINIC ACID AND METAL SALTS THEREOF

Abraham Bavley, Brooklyn, and Charles J. Kauth, Forest Hills, N. Y., assignors to Chas. Pfizer & Co., Inc., Brooklyn, N. Y., a corporation of Delaware

No Drawing. Application June 7, 1952, Serial No. 292,304

4 Claims. (Cl. 260—537)

1. A process which comprises catalytically hydrogenating an alkali metal itaconate in the presence of a Raney nickel catalyst at a temperature from about 45° to 200° C. and under superatmospheric hydrogen pressure.

2,773,898

## PROCESS FOR DRYING PHOSGENE

Georg Brinkmann and Heinz H. Wolfhagen, Leverkusen, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Application January 22, 1954, Serial No. 405,659

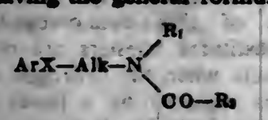
Claims priority, application Germany January 24, 1953

8 Claims. (Cl. 260—544)

1. Process for drying phosgene, which comprises passing a stream of phosgene into, through, and out of a drying zone, while contacting the phosgene with charcoal in said drying zone, the stream of phosgene entering said drying zone containing water vapor which reacts with an equivalent amount of phosgene in said zone in the presence of said charcoal, whereby the stream of phosgene passing out of said zone is dried.

2,773,899

## ALKENOIC AMIDES OF ARYLETHERS OF ALKANOLAMINES



Henry Martin, Zurich, and Hans Zutter, Schaffhouse, Switzerland, assignors to Cilag Limited, Schaffhouse, Switzerland, a corporation of Switzerland

No Drawing. Application November 23, 1954, Serial No. 470,804

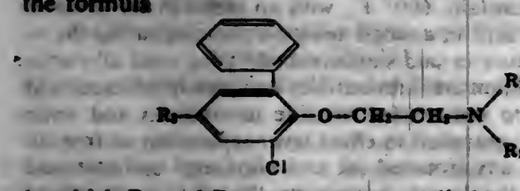
Claims priority, application Germany November 24, 1953

7 Claims. (Cl. 260—562)

1. An amide having the general formula:

wherein Ar is selected from the group consisting of phenyl, lower alkyl-phenyl, chloro-phenyl and lower alkoxy-phenyl radicals, X is selected from the group consisting of oxygen and sulphur, Alk is a lower alkylene radical containing up to three carbon atoms, $R_1$ is selected from the group consisting of hydrogen, lower alkyl, lower alkenyl and lower aralkyl radicals, and $R_2$ is a lower $\alpha,\beta$-unsaturated aliphatic radical.

2,773,900



## SUBSTITUTED ARYL AMINO ALKYL ETHERS

Jack Mills, Glenns Valley, Ind., assignor to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

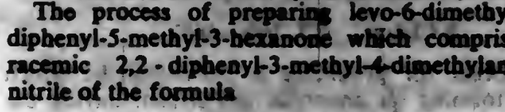
No Drawing. Application November 8, 1954, Serial No. 467,635

4 Claims. (Cl. 260—570.7)

1. A pharmacologically active compound of the class consisting of a base and its nontoxic pharmaceutically useful acid addition salts, said base being represented by the formula

in which $R_1$ and $R_2$ represent lower alkyl groups and $R_3$ is chosen from the class consisting of a hydrogen atom and a chlorine atom.

2,773,901



## THE RESOLUTION AND OPTICAL ISOMERS OF 6-DIMETHYLAMINO-4,4-DIPHENYL-5-METHYL-3-HEXANONE

Aubrey A. Larsen and Benjamin F. Tullar, Rensselaer County, N. Y., assignors to Sterling Drug Inc., Wilmington, Del., a corporation of Delaware

No Drawing. Application March 16, 1948, Serial No. 15,267

1 Claim. (Cl. 260—570.8)

The process of preparing levo-6-dimethylamino-4,4-diphenyl-5-methyl-3-hexanone which comprises reacting racemic 2,2-diphenyl-3-methyl-4-dimethylaminobutanenitrile of the formula

with at least one equivalent of dextro-tartaric acid to form a mixture of diasteroisomeric salts, separating the dextro-2,2-diphenyl-3-methyl-4-dimethylaminobutanenitrile dextro-bitartrate from said diastereoisomeric salt mixture by fractional crystallization, liberating the free dextro-nitrile by reacting said dextro-2,2-diphenyl-3-methyl-4-dimethylaminobutanenitrile dextro-tartrate with an excess of a strong base, reacting said dextro-nitrile with ethyl magnesium bromide, and hydrolyzing the resulting Grignard complex by heating it with mineral acid.

2,773,902

## HYDROGENATION OF PHTHALONITRILES

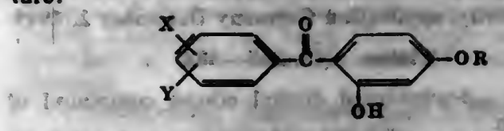
Charles D. Heaton, El Cerrito, Calif., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware

No Drawing. Application May 10, 1954, Serial No. 428,831

8 Claims. (Cl. 260—578)

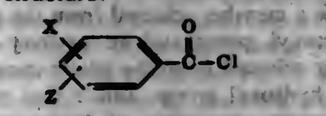
1. Process of preparing an xylylene diamine which comprises hydrogenating a phthalonitrile dinitrile under hydrogenation conditions of temperature and pressure in the presence of a cobalt hydrogenation catalyst and about 1 to 5 parts for each part of phthalonitrile, by weight, of a liquid ammonia-water reaction medium, the ammonia and water being present during reaction in a weight ratio of 50 to 95 ammonia to 50 to 5 water.

2,773,903



## PROCESS FOR BENZOPHENONES (DIMETHYLFORMAMIDE)

William B. Hardy, Bound Brook, and Warren S. Forster, Somerville, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine



No Drawing. Application July 18, 1955, Serial No. 522,833

11 Claims. (Cl. 260—591)

1. A process of preparing a benzophenone of the structure:

in which R is a lower alkyl group, X is selected from the group consisting of hydrogen, lower alkyl, lower alkoxy and halogen, and Y is selected from the group consisting of hydrogen, lower alkoxy, hydroxyl, lower alkyl and halogen which comprises forming a mixture of a benzoyl chloride of the structure:

wherein X is the same as above, and Z is selected from the group consisting of hydrogen, lower alkyl, lower alkoxy and halogen with at least a substantially stoichiometric

quantity of a 1,3-dialkoxy benzene and with at least a substantially stoichiometric quantity of aluminum chloride in an organic solvent, heating the mixture above 100° C. and adding thereto at least 1% by weight of dimethyl formamide of the weight of organic solvent present when the mixture begins to thicken.

2,773,904

## PREPARATION OF ARALKYL KETONES

Robert M. Silverstein, Menlo Park, Calif., assignor to Parex Corporation, Ltd., South Gate, Calif., a corporation of California

No Drawing. Application September 29, 1952, Serial No. 312,163

8 Claims. (Cl. 260—592)

1. The method of producing aralkyl ketones, that includes condensing a fatty glyceride directly with an aromatic hydrocarbon compound in the presence of a Friedel and Crafts type catalyst to form the aralkyl ketone, and separating the ketone as a material consisting essentially of the ketone from the reaction product mixture, said aromatic compound being of the group consisting of benzene, toluene, xylene, and naphthalene.

2,773,905

## SEPARATING PRIMARY MERCAPTANS FROM MIXTURES OF MERCAPTANS

Russell H. Brown, Hammond, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application February 7, 1955, Serial No. 486,701

7 Claims. (Cl. 260—609)

1. A mercaptan separation process which comprises contacting a mixture containing a primary mercaptan and at least one mercaptan from the class consisting of secondary and tertiary with an aqueous solution consisting essentially of water, triethanolamine and soluble lead, in the substantial absence of free oxygen, and separating lead primary mercaptide from unreacted mercaptans of the class consisting of secondary and tertiary.

2,773,906

## α,α-DIALKYL-Ar-PHENYLBENZYL HYDROPEROXIDES

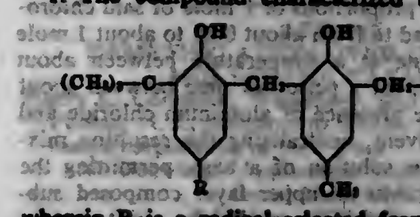
William S. Emerson, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application May 6, 1953, Serial No. 353,425

3 Claims. (Cl. 260—610)

1. The method of preparing an α,α-dimethyl-ar-phenylbenzyl hydroperoxide which comprises passing oxygen into a mixture consisting of an isopropylbiphenyl, a peroxide compound, and sodium bicarbonate at a temperature of from 140° C. to 190° C.

2,773,907



## TRIS-PHENOLS

Frank A. V. Sullivan, Darien, and Arnold R. Davis, Riverside, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application February 5, 1954, Serial No. 408,579

4 Claims. (Cl. 260—619)

1. The compound characterized by the formula:

wherein R is a radical selected from the group consisting of methyl, ethyl and n-propyl and in which R is the same in each occurrence.

2,773,908

## SEPARATION AND PURIFICATION OF PHLOROGLUCINOL

William R. Cake, Glen Rock, N. J., assignor to Hayden Chemical Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application August 7, 1952, Serial No. 303,193

9 Claims. (Cl. 260—628)

7. The process of separating phloroglucinol from water-soluble crude phloroglucinol dihydrate containing other hydroxy phenols including resorcinol extracted from a mass obtained by fusing 1,3,5-benzene trialkali metal sulfonate with caustic alkali and then acidifying the fused product with a mineral acid, the process comprising dissolving the crude phloroglucinol dihydrate in a solvent selected from the group consisting of toluene, xylene, monochlorobenzene, ethyl benzene, cumene, mesitylene, dichlorobenzene, diethylbenzene, and p-cymene, maintaining the resulting solution at a temperature of from about 110° C. to 140° C. to convert the phloroglucinol dihydrate to insoluble anhydrous phloroglucinol whereby anhydrous phloroglucinol crystals are formed, and then separating the crystals from the hot solution containing resorcinol dissolved in the solvent.

2,773,909

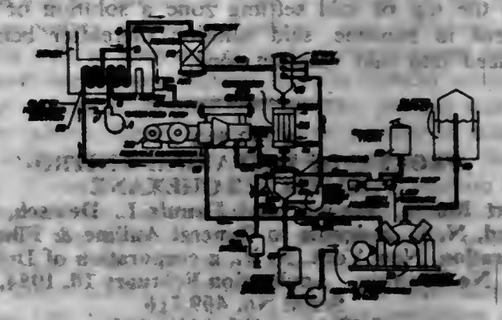
## ADDITION OF HYDROGEN PEROXIDE TO OLEFINIC COMPOUNDS

Curtis W. Smith, Berkeley, Calif., assignor to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Application June 23, 1952, Serial No. 295,112

4 Claims. (Cl. 260—635)

1. A process of producing glycerine which comprises reacting allyl alcohol with aqueous hydrogen peroxide at a temperature of about 70° C. to 90° C. under the catalytic influence of a member of the group consisting of the tungstoheteropoly acids of phosphorus, beryllium and manganese.



2,773,910

## PROCESS OF PREVENTING CORROSION IN THE PRODUCTION OF ALCOHOLS BY HYDRATION OF OLEFINS

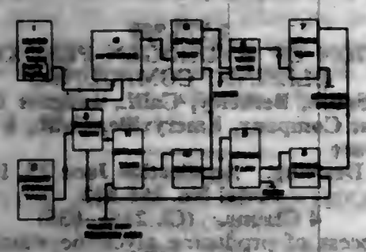
Robert J. Schrader, Longview, Tex., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

Application July 31, 1952, Serial No. 301,926

3 Claims. (Cl. 260—641)

1. In a cyclic process for the manufacture of an alcohol by the reaction, at elevated pressure and temperatures of the order of 250°–300° C., of an olefin and steam in contact with a supported phosphoric acid catalyst in a reactor, a method of preventing condensation of concentrated phosphoric acid on the walls of the product stream cooler, while avoiding dilution of the product, which comprises the steps of introducing the product gas stream substantially at the reaction temperature and pressure into

the product stream cooler and simultaneously spraying under pressure, into direct contact with the product gas stream in the product stream cooler, a spray of the crude product alcohol solution which has been cooled and substantially neutralized, the amount of cooled, substantially neutralized, crude product alcohol solution recycled to the product stream cooler in any given period being at least 50% of the amount of crude product alcohol solution obtained within that period, and being sufficient, without other cooling means, to reduce the temperature of the product gas stream at least to the temperature at which it is saturated with water at the pressure prevailing in the product stream cooler.



---

2,773,911

## CONTINUOUS MANUFACTURE OF NITROBENZENE

Laurent O. Dubois and Robert N. Gerlaide, Woodbury, Winford R. Johnson, Wenonah, and Edgar W. Schneider, Woodbury, N. J., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Application December 11, 1953, Serial No. 397,528
5 Claims. (Cl. 260—645)

1. A process for the manufacture of nitrobenzene which comprises (1) continuously introducing separately into the bottom of a reaction zone a solution of nitrobenzene in benzene and a mixture of nitric acid and sulfuric acid; (2) continuously removing reaction mixture from the top of said reaction zone and transferring said reaction mixture to a settling zone; (3) continuously removing nitrobenzene from the top of said settling zone and waste mixed acid from the bottom thereof, said waste mixed acid being transferred to a denitrating zone; (4) continuously introducing benzene to said denitrating zone and agitating with said waste mixed acid; (5) continuously transferring mixture from said denitration zone to a settling zone; and (6) continuously withdrawing from the top of said settling zone a solution of nitrobenzene in benzene, said solution thereafter being introduced into said reaction zone.

---

2,773,912

## PROCESS OF PREPARING 4-NITROPHENYLCYCLOHEXANE

Albert Bloom, Summit, and Dennis L. Deutsch, Cranford, N. J., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application February 10, 1954, Serial No. 409,516
5 Claims. (Cl. 260—645)

1. A process for preparing 4-nitrophenylcyclohexane which comprises nitrating phenylcyclohexane with a sulfuric acid-nitric acid mixture having a D. V. S. value between 3.2 and 4.7 at a temperature of 0–5° C., separating the crude nitrated mixture, washing the oily layer with water to remove the mineral acidity, and thereafter purifying the mixture by treatment with a lower alkyl alcohol at a temperature of 0–5° C. for a period of time sufficient to yield the 4-nitrophenylcyclohexane which is isolated and washed with a lower alkyl alcohol and dried.

2,773,913

## FLUORINATING ORGANIC COMPOUNDS WITH HYDROGEN FLUORIDE CONTAINING HYDROXONIUM IONS

Dieter Geerts, Leimer, and Heinz Jonas, Leverkusen-Wiesdorf, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Application October 6, 1953, Serial No. 384,906
Claims priority, application Germany October 8, 1952
3 Claims. (Cl. 260—653)

1. In the process for the production of fluorochloroethane by the addition of hydrogen fluoride to trichloroethylene the step which comprises autoclaving at a temperature of 130–135° C. and a pressure of about 40 atmospheres for a period of 22 hours a reaction mixture consisting of 18 kg. of trichloroethylene, 60 g. of $HgCl_2$, 3 kg. of hydrogen fluoride and 45 grams of boron oxide, and recovering $C_2H_3FCl_2$.

---

2,773,914

## MAKING DIARYLETHANES

Erhard J. Prill, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application March 19, 1953, Serial No. 343,519
20 Claims. (Cl. 260—668)

12. A process for condensing aromatic hydrocarbons with acetylene to form 1,1-diarylethanes which comprises subjecting an aromatic hydrocarbon to contact with acetylene at superatmospheric pressure in the presence of catalytic amounts of a material, which material is the sole catalyst present, selected from the group consisting of: A, zinc chloride plus water; B, phosphoric acid ranging from 85 percent $H_3PO_4$ up through increasing extent of dehydration to tetraphosphoric acid; and C, phosphoric acid ranging from 85 percent $H_3PO_4$ up through increasing extent of dehydration to tetraphosphoric acid and containing an effective amount of ions of a metal selected from the group consisting of mercury, cadmium, zinc, copper and silver.

---

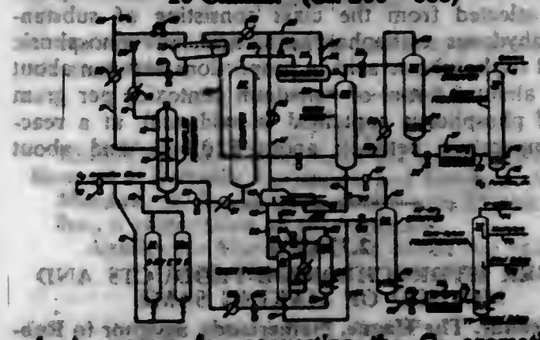
2,773,915

## POUR POINT DEPRESSANT

Edwin R. Baker and Marion L. Sharrah, Ponca City, Okla., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Delaware

No Drawing. Application June 1, 1954, Serial No. 433,848
1 Claim. (Cl. 260—668)

The process of preparing a composition suitable as a lubricating oil pour point depressant which comprises reacting chloromethylated synthetic still bottoms prepared by chloromethylating a synthetic still bottoms product which has a boiling range of 260 to 400° C., $n_D^{25}$ 1.574, average molecular weight 210, A. P. I. gravity 15.1, aniline number 73.4° F., percent hydrogen 10.69–1075, percent carbon 88.88–89.37, percent nonaromatics 27.8, percent aromatics 72.2, average molecular weight nonaromatics 245, and average molecular weight aromatics 204 to a chlorine content of 8.34 percent with diwaxbenzene in the proportions of 1 mole of said chloromethylated compound to from about 0.25 to about 1 mole of said diwaxbenzene at a temperature between about 20 and about 30° C. for a period of time between about 5 to 12 hours, in the presence of aluminum chloride and an inert organic solvent, neutralizing the resulting mixture with an aqueous solution of a base, permitting the mixture to separate into an upper layer composed substantially of said inert solvent, said pour point depressant, and a small amount of unreacted chloromethylated still bottoms and a lower layer composed of substantially water, said aluminum chloride, salt, and unreacted base, separating said upper layer and recovering the pour point depressant therefrom.



---

2,773,916

## PRODUCTION OF 1,3,5-ETHYL XYLENE, META-XYLENE AND BENZENE FROM C9 AROMATICS WITH HF-$BF_3$

Henry C. Thorne, Jr., Hammond, Ind., and David A. McCauley, Chicago, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

Application September 26, 1952, Serial No. 311,621
10 Claims. (Cl. 260—668)

1. A process for converting the $C_9$ aromatic components of a hydrocarbon charging stock consisting chiefly of mixed xylenes and ethyl benzene substantially entirely into benzene, meta-xylene and 1-, 3-dimethyl, 5-ethyl benzene which process comprises complexing the aromatic components of said charging stock in substantially dry state with at least about 6 mols of HF and 1 mol of $BF_3$ per mol of total aromatic hydrocarbon in the charge in a complexing zone, increasing the pressure and temperature on the complexes thus formed and holding complexes at a temperature in the range of about 50° C. to about 70° C. under a pressure of at least 200 p. s. i. g. and high enough to insure liquid phase conditions long enough to convert said $C_9$ aromatic hydrocarbons substantially entirely to benzene, meta-xylene and 1-, 3-dimethyl, 5-ethyl benzene, removing sufficient HF and $BF_3$ liberated from complexes in the reaction step to leave about 6 mols of HF and about 1 mol of $BF_3$ per mol of $C_9$ and heavier aromatic hydrocarbons contained in the product stream, thereafter removing uncomplexed hydrocarbons from the complexes by washing said complexes countercurrently with a saturated hydrocarbon, evaporating HF and $BF_3$ from the remaining complexes at approximately atmospheric pressure in an evaporating zone, withdrawing liquid from the evaporating zone to a decomposing zone, decomposing remaining complexes in said last named zone at reduced pressure, compressing HF and $BF_3$ from the evaporating zone and the decomposing zone and combining the compressed vapors with HF–$BF_3$ initially released from complexes leaving the reaction step, cooling the combined stream, pumping the liquid component of the cooled stream through a further cooler to the complexing zone, compressing a gaseous component of the cooled stream and passing the compressed material through a further cooler to the complexing zone, removing any residual HF and $BF_3$ from the liquid stream from the decomposing zone and fractionating said stream to obtain substantially pure 1-, 3-dimethyl, 5-ethyl benzene.

---

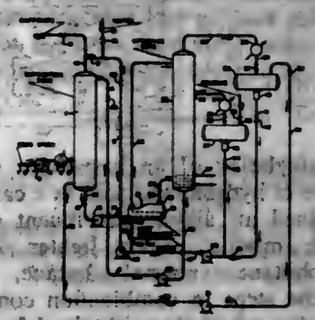
2,773,917

## DEMETHYLATION OVER CHROMIA OR MOLYBDENA CATALYSTS

Henry L. Cecomski, Woodbury, and Wilbur K. Lozman, Paulsboro, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

No Drawing. Application September 16, 1952, Serial No. 309,329
8 Claims. (Cl. 260—672)

1. A process for demethylating methyl-substituted benzenes into other benzenoid hydrocarbons, which comprises contacting the methyl-substituted benzene with a catalyst selected from the group consisting of (1) chromia supported on alumina and containing between about 4 weight percent and about 12 weight percent chromia, (2) chromia cogelled with alumina and containing between about 18 mole percent and about 80 mole percent chromia, and (3) molybdenum oxide-alumina containing between about 5 weight percent and about 20 weight percent molybdenum oxide, at a temperature of between about 1000° F. and about 1150° F., for a contact time of between about 40 seconds and about 1000 seconds, and in the presence of hydrogen gas under pressures of between about 50 pounds per square inch gauge and about 2000 pounds per square inch gauge.



---

2,773,918

## SOLVENT EXTRACTION PROCESS

John H. Stephens, Brookfield, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

Application January 7, 1952, Serial No. 265,242
3 Claims. (Cl. 260—674)

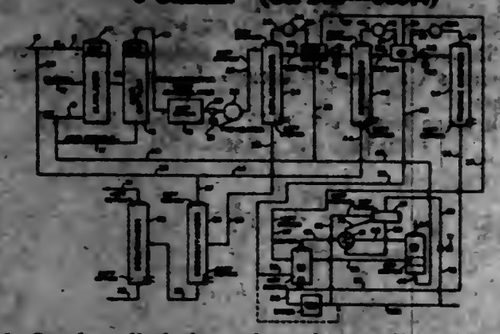
1. In a solvent extraction process for the separation of an aromatic hydrocarbon from a mixture thereof with a non-aromatic hydrocarbon wherein said mixture is contacted in a solvent extraction zone with a selective solvent comprising a solution of primary and secondary solvent constituents to form a fat solvent stream and a raffinate stream, said primary solvent being soluble with and less volatile than said aromatic hydrocarbon and said secondary solvent boiling at a temperature below said primary solvent, the improvement in said process which comprises vaporizing dissolved aromatic hydrocarbon and secondary solvent from said fat solvent stream in a solvent stripping zone, thereby forming a lean solvent stream, recovering secondary solvent from the resulting vapors, passing at least a portion of the recovered secondary solvent in indirect heat exchange relationship with at least one of said aforementioned fat solvent and lean solvent streams to form thereby secondary solvent vapors of greater heat content, passing said secondary solvent vapors into the lower portion of said solvent stripping zone as a stripping medium for the removal of residual dissolved aromatic hydrocarbon from the lean primary solvent in the stripping zone, recovering from the stripping step a predominantly aromatic fraction and a fraction containing aromatic and non-aromatic hydrocarbons, and introducing the last-mentioned fraction into the lower portion of said extraction zone.

---

2,773,919

## METHOD OF PRODUCING ODORLESS NAPHTHAS

Allen F. Millikan, Evanston, Ill., assignor to The Pure Oil Company, Chicago, Ill., a corporation of Ohio



No Drawing. Application December 28, 1953, Serial No. 400,831
8 Claims. (Cl. 260—683.4)

1. A method of removing the characteristic naphtha odor associated with organic peroxide forming and con-

mining components from synthetic alkylate hydrocarbons having a boiling range within about 350° to 600° F. by solvent extraction with a solvent selected from the group consisting of dihydric and trihydric alcohols having 2 to 6 carbon atoms per molecule wherein the hydroxyl groups are attached to adjacent carbon atoms and mixtures thereof, followed by separation of the hydrocarbon phase and water washing.

2,773,920
RECOVERY OF HYDROGEN FLUORIDE FROM ALKYLATION PRODUCT EFFLUENT
Lucien H. Vautrain and Edward Strunk, Sweeny, Tex.; said Vautrain assignor to Phillips Petroleum Company, a corporation of Delaware
Application April 24, 1953, Serial No. 351,818
6 Claims. (Cl. 260—683.4)

1. In the alkylation of an isoparaffin with an olefin in the presence of hydrofluoric acid as a catalyst in which there is obtained an alkylation effluent containing desired alkalate product, gases lighter than propane, propane, isobutane, normal butane, and hydrofluoric acid, the steps in combination comprising: fractionating a hydrocarbon phase obtained from said alkylation to obtain therefrom a fraction containing gases lighter than propane, some propane, and an equilibrium proportion of hydrogen fluoride; placing said fraction under conditions to obtain liquid propane therefrom, which is removed as a product of the process, and a first gaseous phase containing propane, hydrogen fluoride, and gases lighter than propane; cooling said first gaseous phase to obtain therefrom a condensate of hydrocarbon and hydrogen fluoride and to form a second gaseous phase containing substantially only gases lighter than propane, venting said second gaseous phase from the process; separating said condensate into a hydrocarbon phase and a hydrogen fluoride phase and recovering said hydrogen fluoride.

---

2,773,921
PHOSPHORIC ACID-VANADIUM PENTOXIDE CATALYST AND HYDROCARBON CONVERSIONS THEREWITH
Paul N. Eyanson, Jr., Chicago, Ill., and Willard J. Zimmerschied, Cicero, [illegible], assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
No Drawing. Application November 30, 1953, Serial No. 395,509
17 Claims. (Cl. 260—683.15)

1. A solid catalyst, suitable for catalyzing conversions of olefinic hydrocarbons, said catalyst being produced by reaction of vanadium pentoxide and an acid of phosphorus selected from the class consisting of substantially anhydrous orthophosphoric acid, pyrophosphoric acid and triphosphoric acid in proportions between about 0.1 and about 0.4 mol of vanadium pentoxide per gram atom of phosphorus contained in said acid, at a reaction temperature between about 220° C. and about 600° C.

---

2,773,922
RUBBER HYDROCHLORIDE PRODUCTS AND METHOD OF MAKING SAME
Gerrit Schuur, The Hague, Netherlands, assignor to Rubber-Stichting, Delft, Netherlands, a corporation of the Netherlands
No Drawing. Application October 16, 1951, Serial No. 250,750
Claims priority, application Netherlands November 20, 1950
7 Claims. (Cl. 260—735)

1. The method which comprises dispersing, at a temperature from 10° to 40° C., finely divided rubber hydrochloride prepared by hydrochlorination of an aqueous dispersion of natural rubber and which possesses high molecular weight, low solubility, and high chlorine content, to form an organosol in an organic liquid selected from the group consisting of aromatic hydrocarbons, monochlorinated aromatic hydrocarbons, and dioxane, said organic liquid possessing only a slight swelling effect upon the rubber hydrochloride at the dispersion temperature but exerting a stronger swelling effect leading to gelatinization of the rubber hydrochloride when the temperature is increased, the amount of rubber hydrochloride being from 5% to 40% by weight based on the total weight of the organosol, and then heating the organosol to a temperature from about 80° to about 170° C. for a period of from 2 to 10 minutes to gelatinize the dispersed rubber hydrochloride.

# ELECTRICAL

2,773,923
ZONE-REFINING APPARATUS
Charles G. Smith, Weston, Mass., assignor to Raytheon Manufacturing Company, Newton, Mass., a corporation of Delaware
Application January 26, 1953, Serial No. 333,219
6 Claims. (Cl. 13—26)

1. A zone-refining apparatus comprising an elongated body of electrically-conductive material having a recess therein adapted to receive the substance to be zone refined, means supplying heat only into a restricted narrow zone in said body, means for successively applying said first means to successive narrow zones in said body whereby narrow zones in said substance may be melted, each of said zones being transverse to the longitudinal axis of said body and substantially less in length than said recess, and means inhibiting the flow of heat along said longitudinal axis of said body to a substantially greater degree than through said transverse axis thereof.

2,773,924
METHOD OF MAKING ELECTRODES FOR ELECTRIC BATTERIES
Otto H. Brill, New York, N. Y., and Kenneth N. Brown, Teaneck, N. J., assignors to Yardney International Corp., New York, N. Y., a corporation of New York
Application January 12, 1953, Serial No. 331,206
3 Claims. (Cl. 136—6)

1. A rigid, porous electrode plate for an electric battery, said plate being formed by agglomerating a powder composed in major part of silver particles by heating, comminuting the agglomerates thereby formed, molding

the resulting comminution product under pressure to a porous plate-like configuration of predetermined dimensions, and sintering the molded plate to produce the solid electrode plate.

---

2,773,925
ELECTRICAL TRANSLATOR AND METHODS
Bernard J. Rothkin, Levittown, and Frieda A. Stahl, East Meadow, N. Y., assignors to Sylvania Electric Products Inc., a corporation of Massachusetts
Application March 10, 1951, Serial No. 214,969
17 Claims. (Cl. 136—89)

10. The method of producing a localized inhomogeneity in germanium including the steps of exposing the surface of a body of germanium to the action of a granule of zinc at a temperature in the range 600 to 800° centigrade, gradually cooling the germanium body and etching the germanium to remove reaction products of the zinc and the germanium.

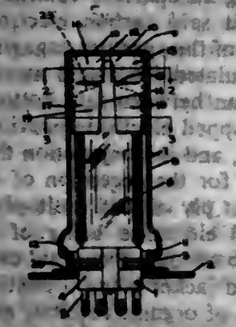
---

2,773,926
DRY CELL
Roland L. Glover, Islington, Toronto, Ontario, Canada, assignor to Union Carbide Canada Limited, a corporation of Canada
Application March 12, 1953, Serial No. 341,918
2 Claims. (Cl. 136—107)

2. In combination with a primary galvanic cell comprising a cupped consumable metal electrode; an immobilized electrolyte adjacent to the inner surfaces of said cupped electrode; a carbon electrode centrally disposed in said cupped electrode and extending outwardly of the open end thereof; a depolarizer mix in contact with said carbon electrode and said immobilized electrolyte; and a flanged metal terminal cap mounted on the end of said carbon electrode, said terminal carrying an electrically insulating washer on the flanged portion thereof; a substantially leakproof container comprising a multi-ply, composite, electrically non-conductive jacket composed of a plurality of plies sealed together to form a unitary wall for said cupped electrode and metallic top and bottom closures for said jacket, the end portions of said jacket and the marginal edge portions of said closures being tightly curled together in liquid-tight engagement; said top closure having an aperture centrally disposed therein adapted to permit said carbon electrode to pass therethrough, the edge of the aperture engaging said washer and thereby being insulated from said metal terminal cap, at least one projection between said bottom closure and the bottom of said cupped electrode providing electrical contact therebetween, and in conjunction therewith providing a reservoir space for the reception of exudate from said cell; the innermost ply of said multi-ply jacket in contact with said cupped electrode being of bibulous material whereby to absorb exudate from said cell; an intermediate barrier ply of said jacket being a continuous, electrolyte-impermeable film of organic resinous material effective to bar transmission of such exudate through the walls of said jacket, and the outermost ply of said jacket being of electrically non-conductive material and serving to support said barrier ply and to strengthen said jacket when said innermost ply is wet with such exudate; and a layer of micro-crystalline wax forming an inner seal between said top closure and depolarizer mix, and extending completely across the cross-section of said cell between said electrodes underlying said metal terminal cap and metal cap closure, and in contact therewith insulating said cap and closure from said electrolyte; said top and bottom closures sealing said cell.

---

2,773,927
STORAGE BATTERY CELL UNIT ACID CONTAINER
Theodore Yeoman, Iowa City, Iowa
Application July 14, 1955, Serial No. 522,036
3 Claims. (Cl. 136—166)



1. Within a storage battery cell unit having vertical plates and horizontal plate connecting straps integral with each of two group posts, a separate, insertable, enclosed vessel consisting of an acid container constructed of a material of the group consisting of glass, hard rubber, plastic, ceramics and wax impregnated paper and having box-like structure with a neck and a stopper therein at the top and recessed ends permitting assembly within conventional batteries with the non-recessed portions of the ends of the vessel extending past the group posts to the ends of the cell and the bottom of the acid container resting on the plate connector straps and held in place by the abutment of the cell cover with the top of said acid container.

---

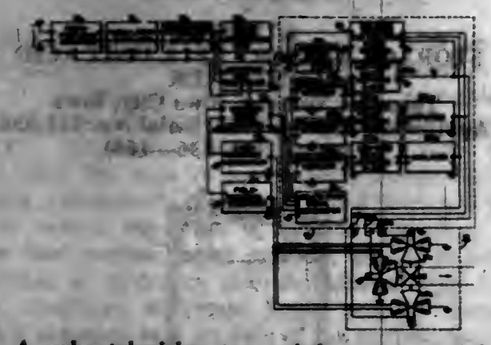
2,773,928
TUBE SHIELD DEVICE
Scipione M. Del Casso, Maywood, Ill.
Application September 15, 1950, Serial No. 184,921
2 Claims. (Cl. 174—35)

1. A shield assembly for a vacuum tube including a tubular shield member having an opening at one end for receiving said tube, and a tube embracing spring disposed in said shield member, said spring being in the form of a sleeve having an axial slot for its entire length, said sleeve having opposed lateral slots intersecting said axial slot and extending therefrom into the body of said sleeve to form upper and lower ring-like portions joined on a side of said shield opposite said axial slot said

upper ring-like portion being in frictional engagement with the inner wall of said shield member to hold said

spring in assembly therewith, and said lower ring-like portion having a tube-receiving opening in alinement with the bore of said shield member.

---



2,773,929

**CONSTANT LUMINANCE COLOR-TELEVISION SYSTEM**

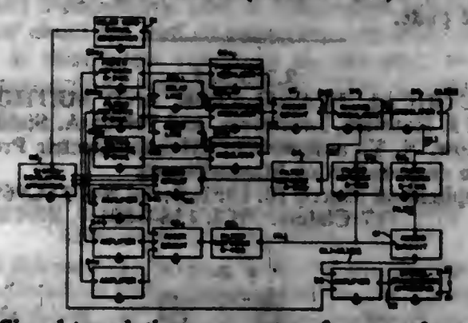
Bernard D. Loughlin, Lynbrook, N. Y., assignor to Hazeltine Research, Inc., Chicago, Ill., a corporation of Illinois

Application May 1, 1950, Serial No. 159,212

19 Claims. (Cl. 178—5.2)

11. A color-television transmitting and receiving system comprising: means for developing a plurality of color signals representative of different color components of an image, said color components being colors to which the eye has luminance sensitivities which may differ; means for developing a signal representative of the luminance of an image and representing said colors in proportion to said luminance sensitivities; means for developing a wave signal modulated at different phases by modulation components representative of said color signals; means for transmitting said developed luminance and wave signals; means for receiving said developed luminance and wave signals; an image-signal-translating channel for said received luminance and wave signals including image-reproducing means having a plurality of color-producing elements for producing different colors to which the eye has luminance sensitivities which may differ, means for translating said luminance signal between said receiving means and said color-producing elements to reproduce the monochrome component of said image, and including a signal-detection system coupled between said receiving means and said color-producing elements and having means for deriving signals representative of selected modulation components of said wave signal for application to said color-producing elements to reproduce said image in color, said channel having means providing signal-translation factors for said selected modulation components and said signals derived therefrom of such magnitudes and phases that said derived signals upon application to said color-producing elements have substantial mutually canceling luminance effects when reproduced in color by said color-producing elements whereby the resultant luminance effect of said wave signal on the eye is minimized and all whereby said color-producing elements may reproduce an image in which the luminance is substantially independent of said wave signal and noise signals applied to said detection system.

---



2,773,930

**COLOR-TELEVISION SYSTEM**

Donald Richman, Fresh Meadows, N. Y., assignor to Hazeltine Research, Inc., Chicago, Ill., a corporation of Illinois

Continuation of application Serial No. 262,306, December 18, 1951. This application May 3, 1954, Serial No. 426,968

27 Claims. (Cl. 178—5.4)

1. Signal-translating apparatus for a color-television receiver which utilizes a color image-reproducing device for reproducing an image from a predetermined group of primary colors comprising: a circuit for supplying a composite television signal representative of a color image and including a first portion having a band width of greater than 0–2 megacycles representative of the visual brightness thereof and a second portion having a subcarrier wave signal having a specific band width and modulated by at least a signal representative of the chromaticity of the image, said chromaticity signal undesirably tending to affect the luminance in an image reproduced by the device; signal-deriving means coupled to the supply circuit and including a network for translating said modulated subcarrier wave signal for deriving from a specific phase thereof a control signal representative of the undesired luminance effects of said chromaticity signal; a signal-combining device coupled to said supply circuit and said deriving means and responsive jointly to at least said first portion and said control signal to develop a resultant signal which is representative of at least the visual brightness of said image and which includes a component inversely related to said undesired luminance effects; and means for utilizing said resultant signal and said subcarrier wave signal in the image-reproducing device to reproduce said image, whereby said first portion is effective primarily to determine the visual brightness of said image and said second portion is effective primarily to determine the chromaticity of said image with any brightness changes due to said undesired luminance effects being effectively eliminated.

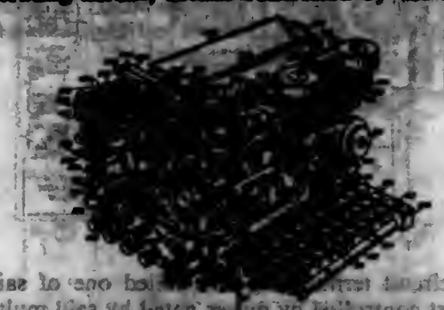
2,773,931

**PRINTING TELEGRAPH APPARATUS**

Edward E. Kleinschmidt, Miami Beach, Fla., and Edward F. Kleinschmidt, Wilmette, and Carl P. Anderson, Highland Park, Ill., assignors, by direct and mesne assignments, of five-sixths to Kleinschmidt Laboratories, Inc., Deerfield, Ill., a corporation of Delaware, and one-sixth to said Edward E. Kleinschmidt



Application August 15, 1951, Serial No. 241,916

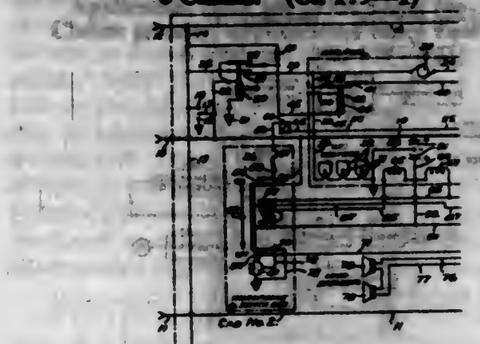
44 Claims. (Cl. 178—23)

1. A printing telegraph transmitting-receiving machine comprising a keyboard transmitter including key levers and adapted to transmit permutated groups of electrical impulses corresponding to the key levers actuated, a selector mechanism to receive and convert permutated groups of electrical impulses into mechanical movement

electrically connected to receive impulses from said keyboard transmitter, recording means including a movable typebar carriage having a relatively stationary slotted segment and a group of typebars pivotally mounted thereon for printing characters at a point fixed relative to said carriage and common to all said typebars, means carried by said movable carriage and controlled by the mechanical movement of said selector mechanism to select a particular one of said typebars corresponding to a received group of electrical impulses, a plurality of function operating means, means controlled by the mechani-

cal movement of said selector mechanism to select a particular function operating means corresponding to a received group of electrical impulses, means to actuate said selected typebar and said selected function operating means, whereby groups of electrical impulses sent out by said keyboard transmitter may be received by the selector mechanism of the sending machine and of other more distant machines to effect the printing of a character or operation of a function of the machines, and a mechanical drive train operative from a common power source for enabling the several mechanical components of said transmitting-receiving machine.

---



2,773,932

**PUBLIC ADDRESS SYSTEM FOR SUBWAY TRAINS**

Frederick B. Woodworth, Garden City, and Ellsworth H. Hale, Baldwin, N. Y., assignors to Smith-Meeker Engineering Company, New York, N. Y., a corporation of New York

Application September 20, 1955, Serial No. 535,489

6 Claims. (Cl. 179—1)

1. In a public address system for trains composed of a plurality of cars having a pair of train lines coupled to extend through all of said cars, loud speaker means in each car, an audio amplifier in each of said cars having an output circuit connected to said loud speaker means and having a second output circuit connected across said train lines, a microphone in at least one of said cars, a microphone switch to be actuated between "on" and "off" positions, said amplifier having an input circuit connected to said microphone and a second input circuit connected across said train lines, and contact means actuated by said microphone switch to disconnect said second input circuit from said train line when said switch is in the "on" position and to disconnect said second output circuit from said train line when said switch is in the "off" position.

2,773,933

**THIRD ORDER PRESSURE GRADIENT RESPONSIVE MICROPHONE**

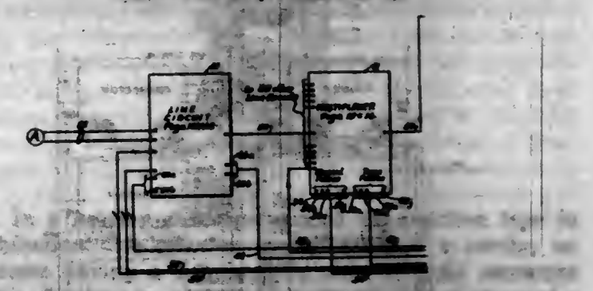
Moses E. Hawley, Collingswood, N. J., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Application February 1, 1954, Serial No. 407,529

9 Claims. (Cl. 179—1)

1. A third order, pressure gradient responsive microphone comprising a pressure sensitive element, a pressure plate disposed on one side of said pressure sensitive element, said pressure plate having an annular groove to form an acoustic chamber, said pressure plate also having a plurality of spaced apart indentations connecting said annular groove with the ambient, a second pressure plate disposed on the opposite side of said pressure sensitive element, said second pressure plate having a second annular groove to form a second acoustic chamber, and a plurality of spaced apart indentations connecting said second annular groove to the ambient.

---



2,773,934

**ELECTRONIC TELEPHONE SYSTEM**

Robert B. Tremaine and Frank A. Morris, Rochester, N. Y., assignors, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware

Application December 24, 1949, Serial No. 134,974

66 Claims. (Cl. 179—15)

11. In an automatic telephone system, a plurality of lines having individually assigned thereto different time positions in repetitive time position frames, common equipment including pulse generating means for repetitively producing signal sampling pulses in said time positions and relatively wide signal sampling pulse gating pulses straddling said signal sampling pulses, multiplexer means controlled by said pulses successively to sample signals appearing on said lines in the time positions assigned thereto, distributor means controlled by said pulses successively to distribute signal samples in the time positions assigned to said lines, and means including a plurality of directively controllable links each in part controlled by said pulses for receiving signal samples from said multiplexer and transmitting signal samples to said distributor to set up telephonic connections between said line.

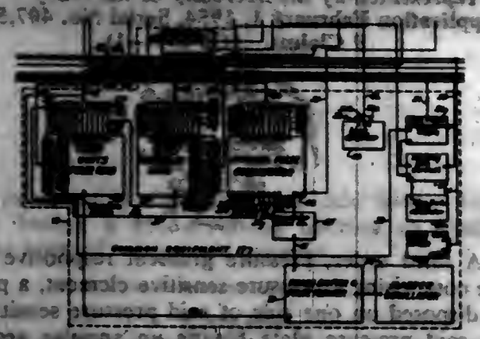
2,773,935

**ELECTRONIC TELEPHONE SYSTEM**

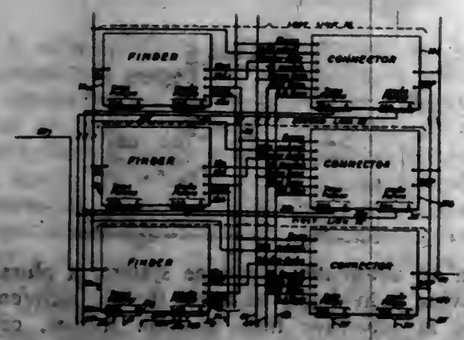


Robert B. Tremaine, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware

Application February 13, 1951, Serial No. 205,641

31 Claims. (Cl. 179—15)

1. In a telephone system, a plurality of lines having

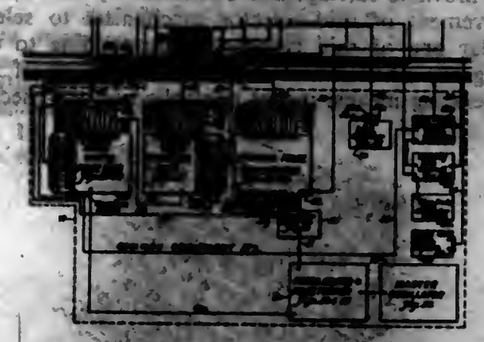


individually assigned thereto different time positions in repetitive time position frames, a multiplexer including gate circuits individually corresponding to said lines, said multiplexer having a signal sample output channel common to all of said gate circuits, means for sequentially supplying high speed signal sample gating pulses to first groups of said gate circuits, means for sequentially supplying relatively low speed group gating pulses to

second groups of said gate circuits, said low speed gating pulses being sub-multiples of said high speed gating pulses, means for energizing said gate circuits to gate signal samples to said output channel during coincidence of the high speed and low speed gating pulses supplied thereto, and means at least in part controlled by the signal samples gated to said output channel for transmitting signals between different pairs of calling and called lines of the system.

---

2,773,936
AUTOMATIC TELEPHONE SYSTEM
Frank A. Morris, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware
Application August 10, 1951, Serial No. 241,351
31 Claims. (Cl. 179—15)

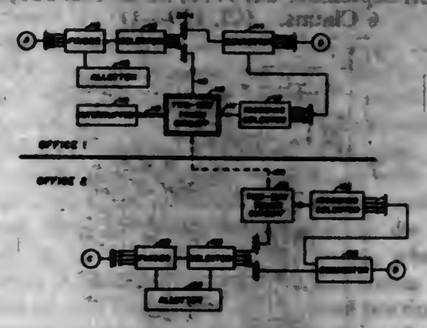


2. In an automatic telephone system, a plurality of lines, a plurality of links common to said lines, an all-links-busy circuit operative to transmit an all-links-busy signal over any calling one of said lines in response to initiation of a call thereon during periods when at least one of said links is idle, and means responsive to operative association of one of said links with the calling line for preventing said circuit from transmitting said signal over the calling line.

---

2,773,937
ELECTRONIC SIGNALING AND SWITCHING SYSTEM
Frank A. Morris, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware
Original application Dec. 24, 1949, Serial No. 134,974. Divided and this application February 4, 1950, Serial No. 142,391
51 Claims. (Cl. 179—16)

10. In a telephone system, a plurality of lines having individually assigned thereto different time positions which recur in repetitive time position frames, multiplexer means including means for gating pulses in the time positions respectively assigned to said lines as said lines are taken into use, line circuits individually terminating said lines in a central office, and means included in



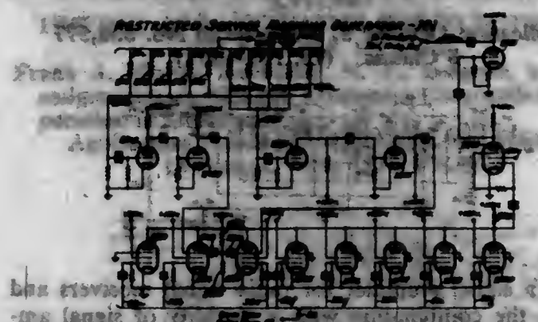
the line circuit terminating any called one of said lines and in part controlled by pulses gated by said multiplexer in the time position assigned to said called line for controlling the transmission of a ringing signal from said office over said called line.

---

ERRATUM
For Class 179—18 see:
Patent No. 2,774,071

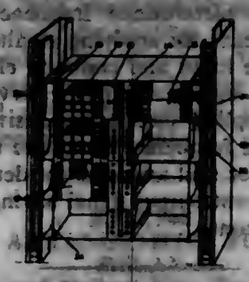
---

2,773,938
TRUNK CIRCUIT
William W. Pharis, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware
Application April 1, 1955, Serial No. 498,137
3 Claims. (Cl. 179—18)



1. A telephone system including a calling line in a first office, a called line in a second office, a trunk line extending between said offices, a trunk circuit terminating said trunk line, switching means, means including a set of talking conductors for extending a call over said switch train from said calling line through said trunk circuit to said called line, two relays in said trunk circuit, means for connecting one of said relays for furnishing talking battery over said talking conductors to said calling line, the other of said relays comprising a differential relay, means for connecting said other relay to be operated over said talking conductors responsive to reverse battery supervision controlled from said called end, at least one set of contacts interposed in said talking conductors between said connections for operating said two relays for completing the electrical continuity of said talking conductors, means in said trunk circuit for measuring the elapse of a predetermined time period, means responsive to the expiration of said time period for operating said contacts to break said talking conductors and terminate conversation, said means comprising said two relays but thereafter holding at least a portion of said switching means operated until both of said subscribers hang up.

---



2,773,939
TELEPHONE SYSTEM
Robert R. Truesdale, Webster, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware
Application May 29, 1953, Serial No. 358,249
29 Claims. (Cl. 179—18)

1. In an automatic telephone system, a plurality of lines having individually assigned thereto different time positions in repetitive time position frames, means including a plurality of impulse responsive links for setting up two-way communication connections between calling and called ones of said lines, and time position responsive restricted service means for restricting the service available to certain calling ones of said lines in accordance with the time position assigned thereto.

---

2,773,940
TELECOMMUNICATION STATION EQUIPMENT
Myron Lakritzky, Neuilly-sur-Seine, France, assignor to Societe Anonyme de Telecommunications, Paris, France, a body corporate of France
Application June 16, 1952, Serial No. 293,759
Claims priority, application France June 21, 1951
6 Claims. (Cl. 179—91)

1. A rack for telecommunication station and exchange equipment comprising a plurality of adjacent vertical cellular structures each of which corresponds to a number of telephone circuits and consists of two spaced vertically extending columns of substantially rectangular cross-section, one aperture in the outer wall of each of said columns intermediate the top and bottom thereof, strips of sockets and strips of terminals on the front face of said columns, cable runs in said columns for connecting together sockets and terminal of said strips situated at different levels, a first set of chassis cells having adjacent each of its sidewalls a vertically extending runway and inserted between the two columns, a second set of chassis cells having adjacent each of its sidewalls a vertically extending runway and inserted between the two columns, the said first and second sets of chassis cells being detachably fixed to said two columns in spaced relation to each other to bound with the apertures in the columns an horizontal runway into which merge the said vertically extending runways, one flat hollow box in the vertical median plane of each of said first and second sets of chassis cells, the said hollow boxes being provided in their front faces with pairs of contact sockets, each of said socket pairs corresponding to one of said circuits, strips of terminals on the front faces of the sidewalls of the said first and second sets of chassis cells, a series of blocks containing the apparatus belonging to each of said circuits respectively, the blocks belonging to the same circuit being mounted in cells of distinct cellular structures of the rack, contact sockets on said blocks along the side edges thereof in front of the contact sockets of the cable heads, strips of terminals on said blocks along the side edges thereof in front of the vertical runways of the chassis cells, U-shaped connecting members between the sockets on the blocks and the sockets on the cable heads, connectors between the strips of terminals on said blocks and the strips of terminals on the front faces of the sidewalls of the said sets of chassis cells and jumpers disposed in the horizontal runway and having it ends engaged in vertical runways of said distinct cellular structures whereby the circuits are connected to the corresponding apparatus and the apparatus of a same series of blocks are connected to each other.

---

2,773,941
HEARING AID APPARATUS
Henry E. Christensen, Copenhagen, Denmark, assignor to American Danish Oticon Corporation, a corporation of Denmark
Application July 15, 1952, Serial No. 298,989
Claims priority, application Denmark July 18, 1951
10 Claims. (Cl. 179—107)

1. In a hearing aid apparatus of the reaction type in combination: an exterior casing defining a cavity, an armature having a substantially circular rigid armature portion firmly secured in the interior of said casing and a plurality of arms extending from said central armature portion, either of said arms having a resilient arcuate extension spaced from said central armature portion and substantially following the periphery thereof, an electromagnetic structure supported exclusively on said armature structure on spaced points adjacent the ends of either of said arcuate extensions in spaced relationship to said central armature portion and means for energizing said electromagnetic system by sound currents.

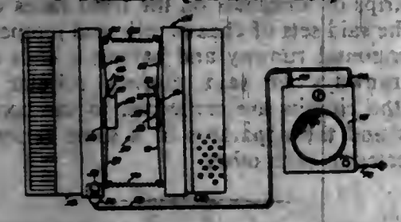
---

2,773,942
ELECTROMECHANICAL TRANSDUCING ARRANGEMENT
Raymond T. Christensen, Oak Park, Ill., assignor to Zenith Radio Corporation, a corporation of Illinois
Application May 15, 1952, Serial No. 287,939
5 Claims. (Cl. 179—110)

1. An electromechanical transducing arrangement comprising: a support member; a piezo-electric transducer, responsive to an induced bending stress to develop an

electrical output signal indicative of variations in the magnitude of said bending stress, pivotally supported about a reference axis by said support member; a plurality of independent diaphragms individually mechanically coupled to said transducer at loading points spaced from said reference axis and from each other for imparting a bending moment to said transducer in response to balanced concurrent actuation of said diaphragms and for pivoting said transducer about said reference axis in response to unbalanced concurrent actuation of said devices; and means for deriving a potential from said transducer indicative of its condition of stress.

---



2,773,943

**PICKUP AND AMPLIFIER APPARATUS**

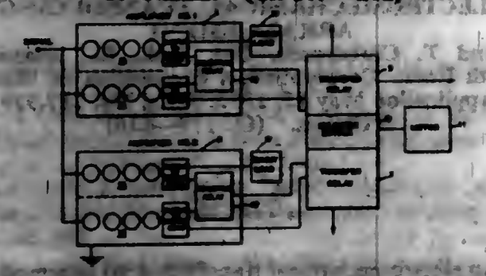
Nick Feierabend, Marx, N. Dak.

Application December 10, 1951, Serial No. 260,879

3 Claims. (Cl. 179—110)

1. A microphone pickup unit for a musical instrument comprising a supporting housing, a cartridge mounted in said housing, an elongated crystal element, means supporting said crystal element adjacent one end of the element, said crystal element being mounted by said supporting means within the cartridge, a supporting member turnably mounted in said cartridge and connected to and supporting the end of the crystal element disposed remote from said supporting means, said supporting means and supporting member providing the only support for the crystal element, an arm having ends laterally offset relative to one another and an intermediate portion, one of said ends extending loosely through a wall of the cartridge and being connected to said supporting member and disposed with its axis substantially perpendicular to the axis of the crystal element and supporting member, said intermediate portion being disposed with its axis transverse to the axis of the crystal element and supporting member, and a diaphragm responsive to sounds and tones forming one wall of the housing, the other end of said arm being laterally offset from the longitudinal axes of the supporting member and crystal element in a direction crosswise thereof and engaging against an inner side of the diaphragm for imparting a mechanical torque to the supporting member and crystal element when the diaphragm is vibrated.

---



2,773,944

**AMPLIFYING SYSTEM WITH STAND-BY CHANNEL**

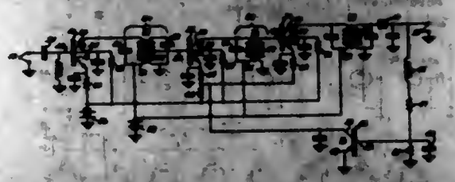
John C. Karlson, Brooklyn, N. Y., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware

Application August 8, 1950, Serial No. 178,319

13 Claims. (Cl. 179—171)

1. In an electrical system, a stand-by amplifier having at least one channel, an operating amplifier having a pair of channels, controlled means connected to only one channel of said operating amplifier, and means connected to both channels of said operating amplifier and sensitive to variations in the relative outputs of said channels, said means connecting said controlled means to said stand-by amplifier when the outputs of the channels of said operating amplifier vary relative to one another a predetermined amount.

---



2,773,945

**TRANSISTOR SIGNAL AMPLIFYING CIRCUITS**

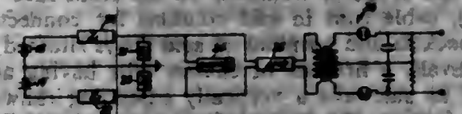
Gerald E. Theriault, Haddon Heights, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application October 5, 1953, Serial No. 536,577

8 Claims. (Cl. 179—171)

2. In a signal amplifier for radio signal receivers and the like, the combination with a plurality of signal amplifying stages connected in cascade and including a first transistor signal amplifying device having at least an input, an output, and a common electrode and a second transistor signal amplifying device having at least an input, an output, and a common electrode, of means providing a source of automatic gain control signal for said circuit, means coupling said automatic gain control source to one of said input and common electrodes of said first transistor signal amplifying device to control the gain therethrough in response to variations in the amplitude of an applied alternating current signal, means coupling said automatic gain control source to one of said input and common electrodes of said second transistor signal amplifying device to control the gain therethrough in response to said variations in the amplitude of an applied alternating current signal, first signal coupling means for applying an alternating current signal between the input and common electrodes of said first transistor signal amplifying device including a single tuned coupling circuit responsive to signals in a predetermined frequency band, second signal coupling means for applying an alternating current signal between the input and common electrodes of said second transistor signal amplifying device including a double tuned coupling circuit responsive to signals in said predetermined frequency band, and means providing an output circuit for said amplifier for deriving therefrom an alternating current output signal having a substantially flat frequency response.

---



2,773,946

**DEVICE FOR DETECTING THE SENSE AND MAGNITUDE OF A D. C. SOURCE**

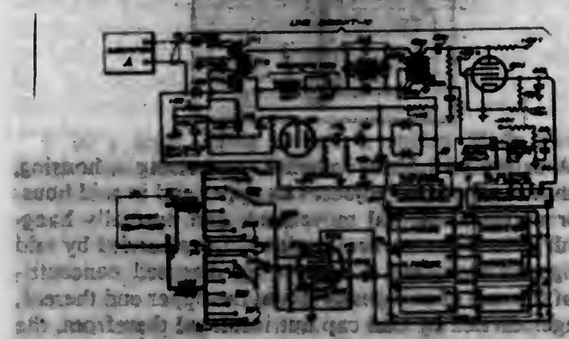
Sol Greenberg, Bronx, N. Y., and Paul W. Salmon, Phoenix, Ariz., assignors to International Telephone and Telegraph Corporation, a corporation of Maryland

Application September 27, 1951, Serial No. 248,624

3 Claims. (Cl. 179—171)

1. A system for detecting the sense and magnitude of a source of direct current voltage, comprising a plurality of impedances connected in series with said source, cyclic means coupled in shunt across at least one of said impedances to shunt said one impedance during a small predetermined portion less than 50% of each of the cycles of said cyclic means to convert said direct current voltage into an alternating current wave having an amplitude difference for opposite polarities thereof, a balanced detector circuit, means to apply said alternating current wave to said detector circuit for detection of the positive and negative portions of said alternating current wave and means to oppose the two detected portions of the alternating current wave to produce an output voltage having both sense and magnitude proportional to that of said voltage source.

---



2,773,947

**TESTING ARRANGEMENT FOR ELECTRONIC TELEPHONE SYSTEM**

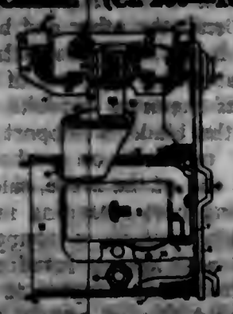
Frank A. Morris, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware

Application March 16, 1955, Serial No. 494,623

15 Claims. (Cl. 179—175.2)

1. In an automatic telephone system, a plurality of lines having individually assigned thereto different time positions in repetitive time position frames, a line circuit associated with each of said lines, a hybrid coil and balancing network arrangement included in each line circuit, multiplexer means for producing pulses on a common output conductor in the time positions individually assigned to said lines as said lines are taken into use, distributor means for distributing signals to said line circuits in accordance with the time positions assigned to said lines, means including a plurality of impulse responsive links connected between said multiplexing means and said distributing means for setting up two-way communication connections between calling and called ones of said lines, and balance testing means for connecting said multiplexer pulses to said distributor means independently of said links.

---



2,773,948

**CONTACT ARRANGEMENT FOR CONTROL RELAY**

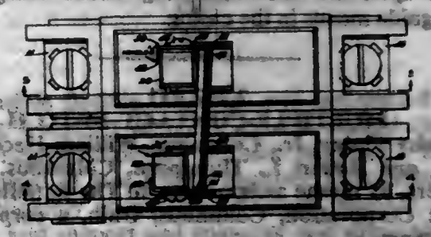
Robert A. Pelz and Delbert Ellis, Beaver, Pa., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application July 29, 1953, Serial No. 370,994

11 Claims. (Cl. 200—16)

1. In an electric circuit controlling device, a contact supporting means, stationary contact members fixed to said contact supporting means, movable contact means for bridging said stationary contact members, a contact actuating arm, a saddle member formed to be U-shaped at both ends and having openings in both sides, a saddle guide adapted to slidably cradle in one U-shaped end of said saddle member, said movable contact means having portions adapted to extend into the openings in the sides of said saddle member to guide the motion of the movable contact means relative to the saddle member, a resilient biasing means, said resilient biasing means being positioned between the movable contact means and the saddle guide to bias said movable contact means and said saddle guide into position and make a unitary structure with said saddle member, said saddle guide being connected to the contact supporting means for normally closed contact operation and the end of said saddle member adjacent said saddle guide being connected to said contact actuating arm for normally open contact operation.

---



2,773,949

**CIRCUIT BREAKER TIE BAR**

William Harold Edmonds, Havertown, Pa., assignor to I-T-E Circuit Breaker Company, Philadelphia, Pa.

Application October 24, 1952, Serial No. 316,719

4 Claims. (Cl. 200—18)

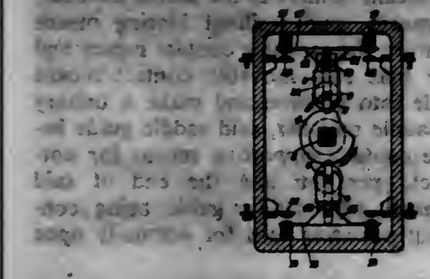
1. A bracket assembly for inter-connecting the handles of a pair of adjacent circuit breakers; each of said handles being movable manually to a closed position and an open position; each of said handles being movable automatically to a position intermediate the closed and open positions; each of said handles being thereafter movable manually to a re-set position identical with the open position; said handles each being rotatably movable in a single plane; said circuit breakers being arranged side by side so that the planes of movement of the handles are parallel; a bracket connected to each of said handles; each of said brackets extending beyond its respective said handle and having a slot therein; a rigid handle connecting bar having opposite ears engaged in the slots of said handle brackets; a clearance between the ears and the slots permitting one of said handles to move to the automatic trip position while the other of said handles remains at said closed position; the movement of said tripped handle to said re-set position causing the other said handle to move from said closed to said open position, the manual movement of either of said handles from said closed to said open position and from said open to said closed position causing the other handle to move correspondingly.

---

2,773,950

**ELECTRIC SWITCH**

Franz Bauer, Vienna, Austria



Application July 20, 1954, Serial No. 444,613

Claims priority, application Austria August 5, 1953

4 Claims. (Cl. 200—31)

1. In an electric switch comprising a casing, a rotatable switching control cam mounted therein, at least one contact bridge movably mounted in the casing in spaced relation to the control cam, movement of each bridge under the control of the cam causing a switching operation: a positive mechanical means operatively inter-

connecting the control cam and each contact bridge, said means including a roller in contact with the cam; a transverse shaft for mounting the roller, the shaft being guided in parallel guide means in the casing, the guide means being arranged to guide the shaft and roller in a straight path between the cam and the contact bridge and preventing any transverse movement thereof; a link having one end pivotally mounted on the shaft; and a

transverse pin arranged to control the movement of the bridge, the other end of said link being pivotally mounted on the pin and the pin being guided in parallel guide means in the casing, the latter guide means being arranged to guide the pin in a straight path between the cam and the contact bridge, and lateral actuating forces exerted upon the interconnecting means being absorbed by the guide means in the casing.

---

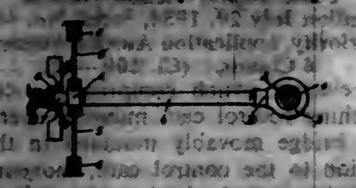
2,773,951

## MULTIPLE-CONTACT SWITCH

Alexander Finlay, Jr., Columbus, William Hocox, Groveport, and Robert L. Thompson, Columbus, Ohio, assignors, by mesne assignments, to The Battelle Development Corporation, Columbus, Ohio, a corporation of Delaware

Application January 2, 1955, Serial No. 479,385
12 Claims. (Cl. 200—23)

1. A switch comprising: a plurality of spaced contacts arranged in a circle; thin metal diaphragm means closely spaced inwardly from said contacts in the absence of flexure and capable of flexing outwardly into electrical contact with said contacts; and means for applying rotary motion to a liquid and for directing said liquid in a rotating jet by virtue of centrifugal force to impinge against successive portions of said diaphragm means adjacent said contacts to provide outward flexure thereof toward said contacts and to provide contact between said diaphragm means and each of said contacts successively.



---

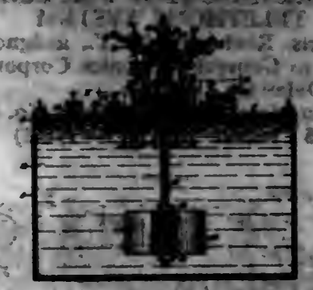
2,773,952

## MECHANICALLY DRIVEN ELECTRIC CONTACT RECTIFIER

Paul Duelling, Berlin-Siemensstadt, Germany, assignor to Siemens-Schuckertwerke Aktiengesellschaft, Berlin-Siemensstadt, Germany, a corporation of Germany

Application April 28, 1953, Serial No. 350,617
Claims priority, application Germany, April 29, 1952
14 Claims. (Cl. 200—36)

1. A contact converter, comprising a contact device having a reciprocable contact, a reciprocable tappet structure engageable with said contact, a revolvable drive shaft having an eccentric cam, a drive bearing cooperatively secured on said cam, said tappet structure having one end firmly connected with said bearing, elastic support means deflectable in the axis of tappet motion and connected with said tappet structure near the other end of said structure, said tappet structure being elastically deflective transverse to said axis.



---

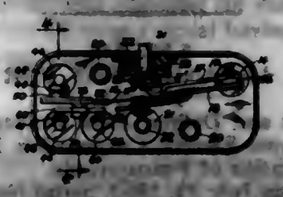
2,773,953

## VEHICLE SAFETY SWITCH

Julius J. Lawick, Kansas City, Kans.

Application November 4, 1954, Serial No. 466,791
6 Claims. (Cl. 200—61.51)

1. A safety switch for vehicles comprising a housing, a pendulum supported adjacent its upper end in said housing for universal pivotal movement, and normally hanging with its axis in a vertical position, a cap carried by said housing and including a circular lip disposed concentrically of the axis of said pendulum at the upper end thereof, a plunger carried by said cap but insulated therefrom, the lower end thereof being disposed concentrically of said lip but at a greater distance from the pivot of said pendulum than said lip, a contact member carried by said pendulum at the upper end thereof for axial movement relative thereto, and resilient means carried by said pendulum and urging said contact member resiliently against said plunger, whereby as said housing is tilted, said lip will engage and cam said contact member out of engagement with said plunger, said plunger and contact member serving as the contact members of a switch.



---

2,773,954

## SNAP ACTION SWITCH

Arthur W. Hayden, Cheshire, Conn., assignor to Hayden Switch, Incorporated, Waterbury, Conn., a corporation of Connecticut

Application June 18, 1953, Serial No. 362,585
2 Claims. (Cl. 200—67)

1. A snap action switch comprising a spring blade supported at one end, the other end being free to move when the switch is actuated, a switch contact mounted opposite one side of the free end of the blade, a pair of switch contacts mounted opposite the other side of the free end of the blade, a support member of a dielectric material mounted on and substantially surrounding the free end of the blade, said support member having a depending post extending in the direction of said pair of switch contacts, a connecting bar loosely mounted on said post against rotation relative thereto, said connecting bar being adapted to engage and electrically connect said pair of switch contacts when the switch is actuated and the free end of the blade is moved toward said pair of switch contacts, pivot means associated with said support adjacent said post to provide for pivotal movement of the connecting bar about a lateral axis when it is moved into contact with said pair of switch contacts, and a contact mounted on the free end of the blade in electrical contact therewith and on the opposite side thereof from said post, said last-mentioned contact being adapted to engage the switch contact mounted opposite said one side of the free end of the blade when the switch is actuated and the free end of the blade is moved toward said switch contact.

---

2,773,955

## SNAP ACTION SWITCH

Arthur W. Hayden, Cheshire, Conn., and Herbert H. Walley, Newton, Mass., assignors, by mesne assignments, to Hayden Switch, Incorporated, Waterbury, Conn., a corporation of Connecticut

Application June 22, 1953, Serial No. 363,107
15 Claims. (Cl. 200—67)

1. In a snap action switch, a spring blade having a compression member which when the blade is unstressed extends out of the plane of the blade and a tension member lying substantially in the plane of the blade, said members being interconnected to each other at their opposite ends, a support member engaging said compression member on one side of said blade, a second support member engaging said tension member on the opposite side of the blade, and means securing said support members together and said spring blade therebetween under predetermined stress with a portion of the compression member being inverted.

---

2,773,956

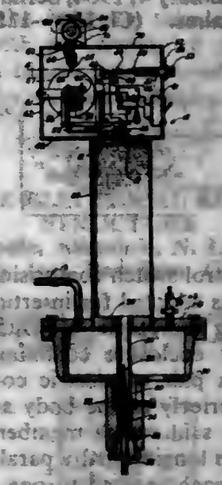
## FRONT OPERATED DISCONNECT SWITCH

David W. Johnson, Newington, Conn., assignor to The Arrow-Hart & Hegeman Electric Company, Hartford, Conn., a corporation of Connecticut

Application October 21, 1953, Serial No. 387,407
13 Claims. (Cl. 200—73)

1. In an electric switch, fixed and movable contacts, a movable contact carrier, manual operating means, means moving with the manual operating means to positively move said carrier causing slow separation of the movable from the fixed contacts, snap-action means operable by said manual operating means and becoming effective automatically on continued movement of said manual operating means after said slow separation thereto to continue movement of said carrier in the same direction with a snap motion, and means causing said carrier to move with a snap action uninterruptedly on reverse operation of said manual operating means.

---



2,773,957

## ALTITUDE SWITCH

Goodwin R. Boyle, San Antonio, Tex.

Application March 26, 1956, Serial No. 573,097
2 Claims. (Cl. 200—81)

1. In a fluid pressure-responsive switch, a first chamber adapted to be connected to a fluid conduit subject to changes in pressure, a second chamber, conduit means extending through the first chamber and connecting said chambers, a restriction in said conduit means to provide a time delay between a change in fluid pressure in the first chamber and a corresponding change in pressure in the second chamber, an expansible flexible chamber connected to and communicating with said second chamber, a pair of contacts, and means engaging said expansible chamber and being formed and arranged to open and close said contacts in response to changes in volume of

said expansible flexible chamber, said last-named means comprising a support mounted on said second chamber, a rotary member mounted on said support, a mercury switch secured to said rotary member, adjustable detent means frictionally engaging said rotary member, a lever pivoted to said support and engaging said expansible flexible chamber, link means connecting said lever to said rotary member, and adjustable spring means biasing said lever toward engagement with said flexible chamber, whereby the force required to rotate said rotary member may be adjusted.

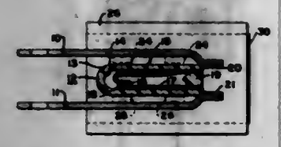
---

2,773,958

## SWITCH

Harold J. Crosswell, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

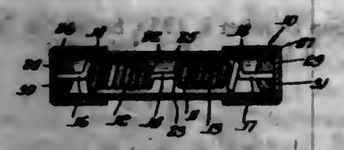
Application October 8, 1953, Serial No. 384,834
2 Claims. (Cl. 200—83)



1. A vacuum switch comprising, in combination, a pair of contacts, a bridging member, a chamber closed by a diaphragm, a spring within said chamber normally causing said diaphragm to be moved to one position, means connecting the diaphragm to the bridging member whereby the bridging member is held in closed circuit position when said diaphragm is in said one position, a normally closed check valve communicating with said closed chamber means adapted to connect the closed chamber with a vacuum source through said check valve whereby the check valve is opened only under predetermined conditions of vacuum and the diaphragm is moved to another position for causing said bridging member to be moved to open circuit position when said predetermined vacuum is applied, and detent means associated with said bridging member for and an independent bleed valve connecting said closed chamber to the atmosphere for

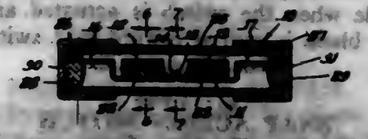
permitting the spring to re-establish the bridging member in closed circuit position after the vacuum has been destroyed and only after a predetermined time delay as determined by the bleed valve.

---



2,773,959
PLUG-IN CONTROL SWITCH
David F. Meyer, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application January 4, 1954, Serial No. 401,899
6 Claims. (Cl. 200—115.5)

1. A plug-in control switch comprising, a pair of parallel extending prongs adapted for insertion into a standard female electric plug receptacle, a switch member having an insulating body enclosure confining a switch structure therein with a pair of electric connection terminal tabs projecting exteriorly of the body at one end thereof in parallel relation, said switch member being positioned between said prongs longitudinally parallel therewith with said terminal tabs each secured to one of said prongs at correspondingly adjacent ends thereof, and an insulating sheath around said prongs with the unattached opposite ends thereof projecting from the sheath for insertion into a female receptacle, each of said prongs including attachment tabs engaging said sheath to secure thereby said prongs in said sheath and retain thereby said switch member between said prongs within said sheath.



---

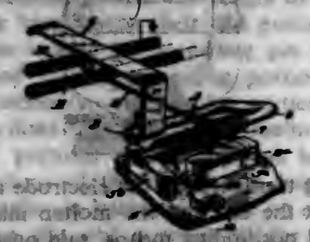
2,773,960
TIME DELAY FUSE
Edward V. Sundt, Wilmette, and Hugh A. Triplett, Des Plaines, Ill., assignors to Sundt Engineering Company, Des Plaines, Ill., a corporation of Illinois
Application April 28, 1954, Serial No. 426,097
14 Claims. (Cl. 200—123)

1. A time delay fuse comprising an electrically conductive single piece fuse element formed from a fusible metallic wire having a predetermined relatively high melting point and having between its ends a substantially tubular coiled wire receptacle portion and a wire resistance heating portion at each end of and adjacent to the receptacle portion, a body of fusible metal having a predetermined relatively low melting point and secured in the receptacle portion of the fuse element in intimate contact therewith so as to provide high thermal conductivity therebetween, and electrical terminals connected to the ends of the fuse element for incorporating the same in an electric circuit to be protected, a sustained overload in the electric circuit causing the resistance heating portions of the fuse element to heat the fuse element and the body of fusible metal substantially as a unit, and the heating of the resistance heating portions of the fuse element to the relatively high point thereof being delayed by the specific heat and the latent heat of fusion of the body of relatively low melting point fusible metal.

2,773,961
TIME DELAY FUSE
Edward V. Sundt, Wilmette, Ill., assignor to Sundt Engineering Company, Des Plaines, Ill., a corporation of Illinois
Application April 28, 1954, Serial No. 426,977
14 Claims. (Cl. 200—123)

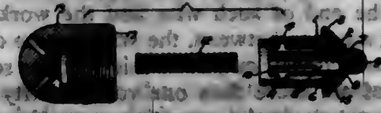
1. A time delay fuse comprising an electrically conductive single piece fuse element formed from a fusible metal having a predetermined relatively high melting point and having between its ends a receptacle portion and a resistance heating portion of limited cross sectional area at each end of and adjacent to the receptacle portion, a body of fusible metal having a predetermined relatively low melting point and secured in the receptacle portion of the fuse element in intimate contact therewith so as to provide a high thermal conductivity therebetween, and electrical terminals connected to the ends of the fuse element for incorporating the same in an electric circuit to be protected, a sustained overload in the electric circuit causing the resistance heating portions of the fuse element to heat the fuse element and the body of fusible metal substantially as a unit, and the heating of the resistance heating portions of the fuse element to the relatively high melting point thereof for breaking the electric circuit being delayed by the specific heat and the latent heat of fusion of the body of the relatively low melting point fusible metal.

---



2,773,962
THERMOSTATIC SWITCH
Dudley C. Perst, Chatham, N. J., assignor to Chatham Controls Corporation, Chatham, N. J., a corporation of New Jersey
Application October 10, 1955, Serial No. 539,535
4 Claims. (Cl. 200—138)

1. A thermostatic switch comprising: an elongated, substantially straight terminally closed tubular, metallic frame; a substantially straight bimetallic element in strip form arranged substantially parallel to the axis of said frame inside the same with its base end rigidly supported at one end of the frame and its opposite end free; and a coacting pair of electrical contacts of which one is stationarily supported by said frame in radially direct electrical connection therewith adjacent to the free end of the bimetallic element and the other is movable laterally with respect to said frame by temperature-responsive movement of the bimetallic element and is maintained in lateral registration with the first-mentioned stationary contact, said frame and at least one metallic component of the bimetallic element being possessed of different coefficients of expansion whereby heat penetration from the frame to the bimetallic element is retarded so that axial wiping will occur between the meeting faces of both contacts due to initial linear expansion of said frame under the influence of changes in ambient temperature while said contacts are in closed condition.

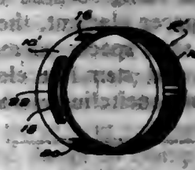


2,773,963
SWITCH MECHANISM
Joseph A. Mathews, Barrington, Ill., assignor to Central Commercial Company, Cook County, Ill., a corporation of Illinois
Application January 30, 1956, Serial No. 562,312
14 Claims. (Cl. 200—153)

1. An electrical switch mechanism of single pole single throw, or single pole double throw spring return type consisting of an organization of coactively related elements comprising a torsion spring wound in coil form; a rigid actuator having two parallel extensions of round cross section; a contactor of elongated form which is free to move within limits in a plane normal to the axis of the torsion spring but which is confined sufficiently in other directions to insure proper coaction with all other elements, fixed contact members suitably disposed about said contactor, and a flat metallic, depressible, angular finger having a portion coactive with one of said parallel extensions to form therewith a friction clutch enabling pivotal motion of the finger about the axis of said extension and a change in angular motion of the finger from a non-permanent angle to a permanent angle in response to downward pressure applied a first time thereto.

---

2,773,964
POINT CONTACT DEVICE FOR HIGH VOLTAGE RADIO FREQUENCY APPARATUS
Charles F. Malfranek, Newark, N. J., assignor to International Telephone and Telegraph Corporation, Nutley, N. J., a corporation of Maryland
Application October 20, 1954, Serial No. 463,481
2 Claims. (Cl. 200—166)



1. A resilient point contact device for high voltage radio frequency apparatus comprising a cylindrical housing having an end wall which has an opening disposed axially of the housing, a hollow cylindrical member disposed for axial movement in said housing, said member having a shoulder flange slidably engaging the inner surface of said housing and adapted to abut against said end wall and an end extension adapted to protrude through said opening, means in said housing to resiliently urge said member so that said end extension functions as a resilient contact, and said hollow cylindrical member being slotted at the end thereof opposite said extension to provide a plurality of resilient fingers and said fingers being provided with laterally disposed portions spaced rearwardly of said shoulder flange for resilient sliding engagement with the inside surface of said housing.

---

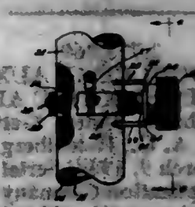
2,773,965
ELECTRICAL RHEOSTAT ASSEMBLY
Edwin W. Drewitz and Victor Stein, Flushing, N. Y., assignors to De Jur-Amsco Corporation, Long Island City, N. Y., a corporation of New York
Application July 28, 1954, Serial No. 444,462
2 Claims. (Cl. 201—48)

1. A sub-assembly resistance element for drop-fitting into a casing to produce a rheostat assembly and dielectric bushing, and a roller freely journalled on each

ing a prefabricated resistance element designed for being electrically tested and stocked prior to making the rheostat assembly, comprising an accurately pre-dimensioned insulator tube and a resistance wiring unit united to the

interior wall of the insulator tube, said insulator tube being provided with an opening of predetermined area to be filled with a conducting material for "shorting out" selected turns of the resistance winding.

---



2,773,966
VARIABLE ELECTRICAL RESISTANCE STRUCTURE
Alfred J. Mastropole, Allendale, N. J., assignor to G. M. Giannini & Co. Inc., Pasadena, Calif., a corporation of New York
Application August 10, 1953, Serial No. 373,331
19 Claims. (Cl. 201—59)

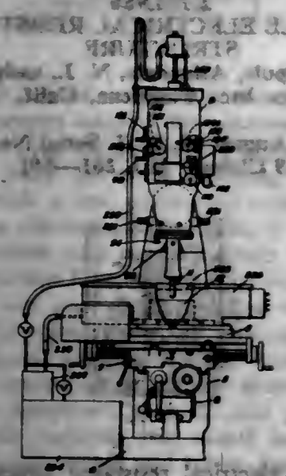
1. A variable electrical resistance structure, comprising a cylindrical shell, a resistance winding carried in insulated relation on the convex surface of the shell, a mounting plate at the forward end of the shell and normal to the axis thereof, a control shaft journaled on the axis of the shell and operable from forward of the mounting plate, brush means mounted on the shaft and extending therefrom at the rear of the shell including a substantially linear contact formation extending forwardly substantially parallel to the convex surface of the shell and closely spaced radially outwardly thereof, a portion only of the winding being supported by the contact formation in spaced relation with the shell, said shaft having a thread within said shell, a nut engaging said thread, said nut being slidingly keyed with respect to said shell, and a stop formation arranged to engage said nut to limit the rotation of said shaft to a predetermined limited range that includes more than one rotation.

---

2,773,967
ELECTRICAL RESISTOR AND THE LIKE
Joseph J. Corny, Chicago, Ill.
Application September 8, 1954, Serial No. 454,744
7 Claims. (Cl. 201—62)

1. An electrical resistor and the like having an insulating coat having an opening through which a portion of the resistance wire of said resistor is exposed, terminal means including a selectively movable encircling element about said resistor, portions of said encircling

element being under different degrees of force when



such bushing, and a roller freely journalled on each the interior of said cup-shaped body portion opening

element being under different degrees of force when said terminal means is in contacting position; a contact element on one portion of said encircling element; a stem-like element extending outwardly from said encircling element, and being secured thereto at its inner end; an apertured spacer element, the stem-like element extending through said spacer element and grippable means mounted on said stem-like element whereby the tension applied to said encircling element may be varied.

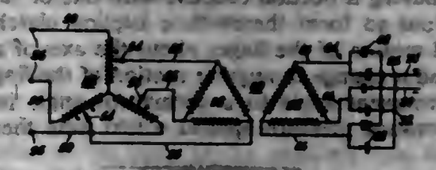
---

2,773,968
ELECTRO DISCHARGE MACHINE
Mario Martellotti and James W. Evans, Cincinnati, Ohio, assignors to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio
Application January 10, 1956, Serial No. 558,252
19 Claims. (Cl. 219—69)

1. In an electrical discharge machine of the character described having a work table and a tool head mounted on the machine in spaced relation with the axis of said head substantially perpendicular to the work surface of said table, the combination of a telescoping sleeve assembly including a plurality of non-concentric sleeves journaled in said head for rotation about the axis of said head, an axially movable spindle mounted in the central sleeve of said assembly for supporting an electrode for axial feeding, a source of electrical energy connected to said electrode and work support to produce a series of electrical discharges therebetween, means to relatively adjust said elements to effect lateral shifting of the axis of said spindle and electrode relative to the axis of said head to position the electrode axis as an element of a cylindrical surface whereby rotation of said assembly causes said electrode to generate a cylindrical surface, an electrical power operable means having motion transmitting connections to effect axial feeding of said spindle and electrode and to effect rotation of said sleeve assembly, and an electric circuit means responsive to the electrical characteristics of said electrical discharges for controlling the rate and direction of said power operable means.

---

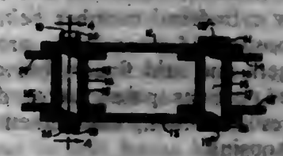
2,773,969
DEVICE FOR PRODUCING AUXILIARY MAGNETIC FIELDS IN ELECTRIC ARC WELDING
Hans Glauber, Mosbach, Baden, Germany, assignor to Kraftanlagen A. G., Heidelberg, Germany
Application March 9, 1954, Serial No. 415,694
Claims priority, application Germany March 14, 1953
27 Claims. (Cl. 219—130)



1. In a device for arc-welding where a coated welding electrode is arranged substantially parallel to the welding joint and in contact therewith, at least one pressure block of non-magnetizable material, said pressure block being adapted to be positioned transversely across the electrode and spaced from the work on both sides of the electrode, whereby an open gap is formed on each side of the electrode between the work and the pressure block, at least one means for generating a magnetic field, said magnetic

field extending transverse to the electrode and in a direction to deflect the arc and the molten material towards the work, and positioning means, said positioning means forcing said pressure block towards the electrode, whereby the electrode is positioned with respect to the work.

---

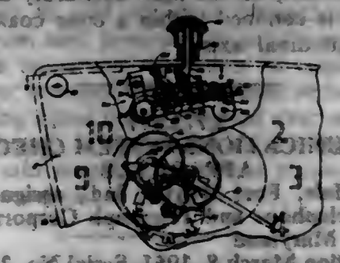


2,773,970
METAL ARC WELDING APPARATUS
John F. Galbraith, Plainfield, Wilbur H. Helmbrecht, Union, and Reuben R. Lobosco, Fanwood, N. J., assignors to Union Carbide and Carbon Corporation, a corporation of New York
Application October 14, 1953, Serial No. 386,048
4 Claims. (Cl. 219—131)

1. Metal arc welding apparatus comprising the combination of an A. C.–D. C. rectifier source of welding current provided with means for adjusting the output potential thereof, at a selected open-circuit potential of between 15 and 45 volts, and a metal arc welding device provided with means for feeding a welding wire electrode at an adjustable substantially constant preselected speed toward work to be welded, and means including welding leads for conducting current supplied by said source through the end of such wire and the work to energize a welding arc therebetween, the volt-ampere characteristic of the direct current output of said rectifier source having a droop of not more than one volt per fifty amperes increase in current, in the operating range thereof, whereby the welding operation is stabilized.

---

2,773,971
CHAINS AND THE LIKE
James Tootell, Chicago, Ill., assignor to Chains, Inc., Delton, Ill., a corporation of Illinois
Application August 4, 1954, Serial No. 447,720
6 Claims. (Cl. 219—150)

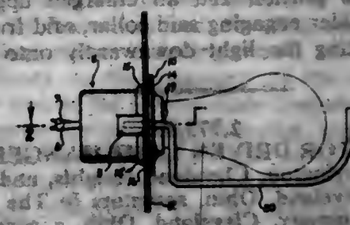


1. A method of producing a length of roller chain which chain comprises a series of rigid rectangular sections each composed of a pair of parallel oppositely disposed inside side bars spaced apart a distance to accommodate the toothed peripheral portion of a sprocket wheel, and a hollow bushing at each end of such rectangular section and extended through openings of said inside side bars to the outside surfaces of such inside side bars each bushing having a journal opening of substantially uniform diameter throughout the length of

such bushing, and a roller freely journalled on each bushing between the inside side bars of such section, together with a pin extended through and journalled in each bushing and projecting beyond the outside surfaces of the inside side bars of the corresponding rectangular section and having bearing contact with the bushing throughout substantially the entire length of the bushing, and outside side bars having their end portions provided with openings to receive the projecting pin portions and rigidly connected to said projecting portions of proximate pins of successive rectangular sections and connecting said sections together, which method comprises setting the end portions of the bushings into openings in the end portions of the inside side bars with press fits and with a roller in journal position on each bushing, thereafter setting the end portions of the outside side bars onto the projecting pin portions with press fits, and thereafter engaging the opposite ends of each pin by electrodes of a source of current supply and subjecting said electrodes to pressure against the pin ends, to thereby heat the pin ends by contact resistance to current flow to soften said pin ends and compress them towards each other and towards the outside surfaces of the proximate outside side bars for enlargement of said pin ends laterally into enlarged heads at locations outside of the outside side bars.

---

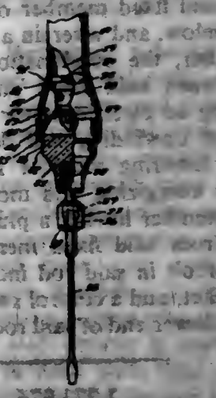
2,773,972
ILLUMINATION CONTROL FOR ELECTRIC CLOCK
Richard Krause, Thomaston, Conn., assignor to General Time Corporation, New York, N. Y., a corporation of Delaware
Application March 18, 1955, Serial No. 495,283
7 Claims. (Cl. 240—2)



1. In an electric clock the combination comprising a dial, means including a clock mechanism having a constantly running motor and gear train for providing time indication on said dial, a lamp bulb for illuminating the dial and arranged adjacent thereto, a source of current connected to said lamp bulb for energizing the same, a rheostat connected between the current source and the lamp bulb, clutching means engageable with said gear train for changing the setting of said rheostat, and a conveniently accessible manual operator on said clock for operating said clutching means.

---

2,773,973
COMBINED LAMP GUARD AND SOCKET MOUNTING DEVICE
Halbert W. Hoard, Scottsdale, Ariz., and Dennis A. Olson and Thomas A. Vollan, Milwaukee, Wis., assignors to Uniloctric, Inc., a corporation of Wisconsin
Application June 19, 1953, Serial No. 362,742
1 Claim. (Cl. 240—4)



In combination with a panel having a hole therein which is widened at opposite edge portions, and having a pair of apertures therein adjacent to the edge of said hole at diametrically opposite locations which are spaced from said widened portions of the hole, means for mounting a lamp bulb on the panel, comprising: a lamp socket having a cup-shaped body portion rotatably received in and projecting rearwardly through the hole in the panel, the interior of said cup-shaped body portion opening to the front of the panel and being adapted to receive the base of a lamp bulb to mounted the bulb on the panel in a position projecting forwardly therefrom; an integral annular flange on the socket surrounding the front of the body portion and providing a flat rearwardly facing annular shoulder engaging the front face of the panel around the edge of the hole therein; a pair of diametrically opposite lugs on opposite sides of the socket body engaging rear portions of the panel over said apertures therein and cooperating with said flange to clamp the panel therebetween and thus hold the socket against axial displacement from the hole in the panel except upon rotation of the socket to a detaching position at which said lugs register with the widened portions of the panel hole, and at which detaching position the body portion of the socket

may be drawn axially forwardly through the hole in the panel, said lugs and the flange having aligning holes therein in which register with said apertures in the panel; and a lamp guard for protecting a lamp bulb in the socket and for locking the socket against rotation in the panel hole toward said detaching position of the socket, said lamp guard comprising a substantially U-shaped wire member having a portion remote from the panel to protectively cover the end of a lamp bulb in said socket, and having a pair of spaced apart parallel prongs on its inner end projected rearwardly into and snugly but detachably fitting said holes in the flange and lugs, said prongs passing through said apertures in the panel to thus preclude rotation of the socket in the panel hole except upon forward withdrawal of the lamp guard prongs from said holes in the flange and lugs.

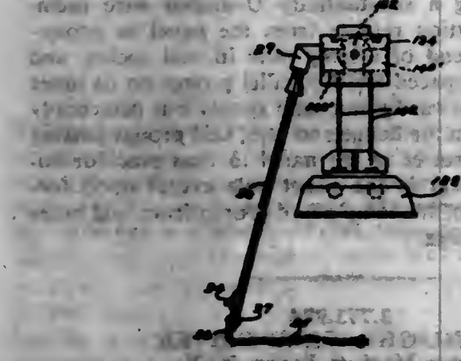
---

2,773,974
FLASHLIGHT SCREW DRIVER
George Markett, Bronx, N. Y.
Application December 5, 1955, Serial No. 551,097
3 Claims. (Cl. 240—6.46)

1. A combination flashlight and screw driver comprising a hollow handle, dry cells positioned within said handle, said handle being closed at one end, the open end of said handle being formed with a hollow enlarged portion terminating in an externally threaded portion, switch means within said handle, reflector means positioned within said enlarged portion, and a transparent

head member adapted to abut said reflector means, an internally threaded collar secured to said head member adapted to be removably screwed onto said externally threaded portion of said handle, chuck means carried by said head member, and a screw driver bit removably mounted within said chuck means, said reflector means comprising a reflector having a central upwardly extending externally threaded hollow portion, an internally threaded insulator member screwed onto said externally threaded portion, a lamp positioned within said internally threaded member, said reflector having oppositely disposed slots, and lugs carried by said transparent head member extending upwardly through said slots, said externally threaded portions of said handle having oppositely disposed slots receiving said lugs upwardly therewithin, and said head portion comprising a frusto-conical portion having a concave exterior surface, an intermediate cylindrical portion and an enlarged upper portion having a shoulder engaging said collar, said frusto-conical portion directing the light downwardly onto the screw.

---



2,773,975

## MOTOR DRIVEN LAMP HANGER

Thayer B. Farrington, Cleveland Heights, and Harold L. Dalzell, Cleveland, Ohio, assignors to The Thompson Electric Company, Cleveland, Ohio, a corporation of Ohio

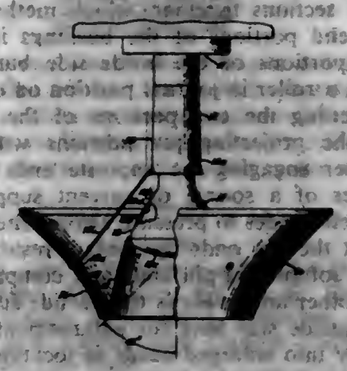
Original application March 19, 1948, Serial No. 15,794. Divided and this application October 5, 1951, Serial No. 249,982

11 Claims. (Cl. 240—66)

1. In lighting apparatus comprising a fixed member in an elevated position above a floor and a lowering member adapted to occupy a raised operative position in juxtaposition with said fixed member or to occupy a position lowered therebelow, and wherein a lamp is carried by said lowering member, the combination of flexible supports connected between said fixed and lowering members, means including an electric motor on said fixed member for winding and unwinding said flexible supports respectively as said lowering member is raised and lowered, and means for energizing said motor including a circuit on said fixed member having a plug-in socket, and a stiff rod reaching from said fixed member to the floor and an electrical circuit in said rod including contacts insertable in said socket, and a control switch in said last named circuit near the lower end of said rod.

---

2,773,976



## LIGHTING FIXTURE

George E. Gleitsz, University Heights, and Arthur W. Mattson, Lakewood, Ohio, assignors to The Art Metal Company, Cleveland, Ohio, a corporation of Ohio

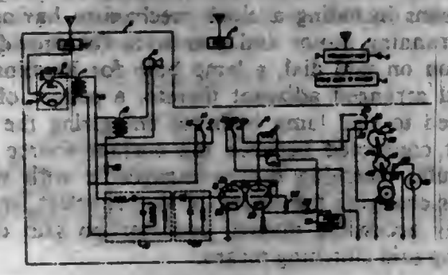
Application March 16, 1953, Serial No. 342,352

1 Claim. (Cl. 240—78)

A lighting fixture, comprising a support, a reflector type processed bulb having a base detachably mounted in said support and a portion projecting from said base, said bulb portion having a surface with an inner reflecting face increasing in lateral dimensions to a maximum as it extends away from said base and having a convex light transmitting surface bridging across said maximum dimension, and a light directing specular reflector secured to said support and associated with said bulb, said reflector having an annular inner reflecting specular surface coaxial with the longitudinal bulb axis, said reflector having a light entrance end adjacent to and

generally surrounding and equally spaced from said maximum dimension and having a light exit and remote therefrom with the annular surface therebetween gradually increasing in lateral dimension along a curve constructed so that the reflector inner reflecting specular surface is an extension of said bulb portion reflecting inner face to form therewith a generally continuous reflecting curve surface, said reflector acting as a light directing shield so that substantially all the light outwardly directed from said exit end is confined within a cone coaxial with the reflector longitudinal axis.

---



2,773,977

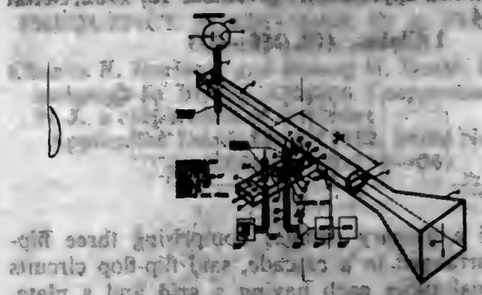
## COMMUNICATIONS SYSTEM CHECKING APPARATUS

Robert W. Hale, Fort Wayne, Ind., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland

Application March 8, 1951, Serial No. 214,451

6 Claims. (Cl. 250—6)

1. A receiver for receiving communication signals and periodic checking pulses of a predetermined time spacing received during intervals when communication signals are not being received, comprising means for separating said pulses, a relay momentarily operative in response to said pulses, a motor, contacts closed in response to operation of said relay for initiating movement of said motor, a shaft rotatable by said motor, a cam on said shaft, contact means operated by said cam for closing an operating circuit for said motor and for opening said cam operated contacts upon a predetermined interval of rotation of said motor to stop said motor, an indicating device circuit, means mounted on said shaft for intermittently closing said indicating device circuit a plurality of times during said interval of rotation and an indicating device in said indicating device circuit.



2,773,978

## TRANSMITTING AND RECEIVING CIRCUITS FOR WAVE TRANSMISSION SYSTEMS

Harold T. Friis, Rumson, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application January 30, 1943, Serial No. 474,164

3 Claims. (Cl. 250—13)

1. In combination in a duplex signaling system, a signal wave pulse generator, a signal receiver, a common antenna for radiating the signal pulses produced by said generator and for picking up incoming wave pulses, a main hollow pipe wave guide connecting said generator to said antenna, a branch hollow pipe wave guide feeding said signal receiver, a chamber in said branch guide resonant to the frequency of the outgoing wave pulses produced by said generator and to the frequency of the incoming wave pulses picked up by said antenna, the input of said resonant chamber being electrically coupled directly to said first wave guide through an iris in the side wall of the latter, a spark gap connected across said resonant chamber, adapted to arc to effectively short circuit said chamber, and thus to effectively reduce the voltage input to said receiver, in response to the resonant voltage applied to said chamber by each signal pulse transmitted from said generator to said antenna, and to remain in the non-arcing condition in response to the relatively lower resonant voltage applied to said chamber by the incoming signal pulses received over said first line from said antenna, so as to provide a minimum of attenuation to said incoming pulses in transmission over said branch wave guide to the receiver.

---

2,773,979

## FREQUENCY CONVERTER

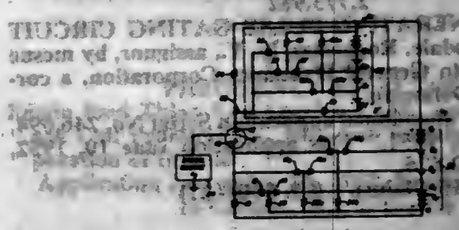
Edward Chatterton, Jr., and Joseph T. Beardwood III, Philadelphia, Pa., assignors to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania

Application February 2, 1953, Serial No. 334,436

3 Claims. (Cl. 250—20)

1. A low noise figure heterodyne frequency converter comprising a first transformer having at least a primary winding and a secondary winding, said primary winding being arranged to receive a signal to be heterodyned, a load resistor, a blocking capacitor and a mixer crystal, said three last-mentioned elements being connected in series circuit in the order recited, said load resistor having a resistance small compared to the average impedance of said mixer crystal at the frequency of the local oscillator signal supplied to said frequency converter, said secondary winding being connected at the two ends thereof to the two end terminals of said series circuit to form a closed series loop, a source of bias potential for said mixer crystal, means connecting said source of bias potential between the junction of said mixer crystal and said blocking capacitor in said series circuit and the junction of said load resistor and said secondary winding of said first transformer, a second transformer having at least a primary winding and a secondary winding, said primary winding of said second transformer being arranged to receive a substantially sinusoidal local oscillator signal, one terminal of said secondary winding of said second transformer being connected to the junction of said secondary winding of said first transformer and said load resistor, a clipper crystal, a second blocking capacitor and signal blocking means, said three last-mentioned elements being connected in a second series circuit, said clipper crystal occupying an end position in said second series circuit, the end terminal of said second series circuit adjacent said clipper crystal being connected to a second terminal of said secondary winding of said second transformer and the other end terminal of said second series circuit being connected to the junction of said load resistor and said first-mentioned blocking capacitor, said signal blocking means including means offering a high series impedance at the frequency of the signal to be heterodyned and at the intermediate frequency, a source of bias potential for said clipper crystal, means connecting said last-mentioned source between the terminal of said clipper crystal remote from said secondary winding of said second transformer and the junction of said load resistor and said secondary winding of said first transformer, the amplitude and polarity of the bias supplied by said last-mentioned source being such as to cause a selected portion of the negative half cycle of the local oscillator signal supplied to said load resistor to be clipped, said selected portion being less than the entire negative half cycle, and signal coupling means associated with said load resistor for coupling an intermediate frequency signal from said converter.

---



2,773,980

## AMPLITUDE SENSITIVE MULTISTATE DEVICE

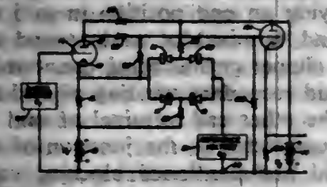
Bernard M. Oliver, Morristown, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application December 30, 1950, Serial No. 203,652

17 Claims. (Cl. 250—27)

1. In combination, a thermionic tube having at least a plate and a cathode and a control grid, an output circuit connected between said plate and said cathode, a load impedance and a multipotential source of direct current and a cathode impedance serially included in said output circuit, means connected from said cathode to different intermediate potential points on said multipotential source, said means comprising a plurality of separate paths connected from said cathode to said points, each of said paths including a pair of asymmetrically conducting devices having like electrodes connected together, one of said devices in each path being nearer to said cathode in each path than the other of said devices and the other of said devices being serially connected with said one device in said path, a direct current circuit for each of said paths including an impedance connected from a point between each of said pairs of devices to a point in said output circuit, the potential of said last-named point relative to said intermediate potential points causing major direct current to flow through said other device of each pair when

said one device of each pair is non-conducting, and a signal voltage input circuit connected from said grid to said cathode and including said cathode impedance.



---

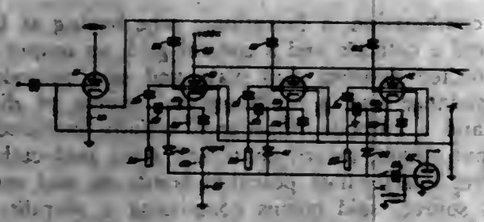
2,773,981

## AMPLITUDE-SENSITIVE MULTISTATE DEVICE

William M. Goodall, Oakhurst, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application December 30, 1950, Serial No. 203,662
8 Claims. (Cl. 250—27)

5. In combination, an amplification device having an input circuit and an output circuit, said input circuit having a portion thereof in common with said output circuit, a first impedance in said common circuit, a load impedance in said output circuit, and circuit control means for abruptly changing the state of conduction of said amplification device; said circuit control means including a shunt impedance, a reference potential point, two asymmetrically conducting devices connected in a series circuit from a point in said common circuit between said first impedance and said amplification device to said reference potential point, the portion of said series circuit connecting said reference potential point to said asymmetrically conducting devices being isolated from said input circuit and said output circuit, said asymmetrically conducting devices having like terminals connected together and to one terminal of said shunt impedance, and circuit means for continuously supplying current of one polarity through said shunt impedance to said like terminals and through at least one of said asymmetrically conducting devices to bias at least one of said asymmetrically conducting devices in the low resistance state.



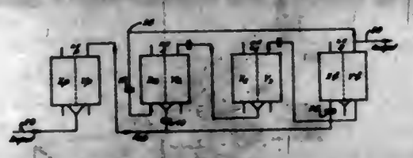
---

2,773,982

## QUASI-REGENERATIVE PULSE GATING CIRCUIT

Robert B. Trousdale, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware

Continuation of abandoned application Serial No. 246,094, September 11, 1951. This application June 10, 1952, Serial No. 292,676
15 Claims. (Cl. 250—27)



15. A pulse gating circuit, comprising a control valve, a gating rectifier included in the current path of said control valve, means for applying pulses to one electrode of said rectifier in the correct polarity normally to cause said rectifier to conduct, means including a condenser connected to said one electrode of said rectifier for biasing said rectifier against conduction, means for rendering said control valve conductive to produce a predetermined minimum value of current flow through said rectifier, and means for deriving said pulses from the other electrode of said gating rectifier during periods when said control valve is conductive.

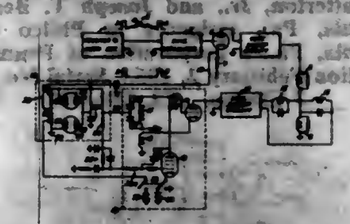
2,773,983

## ELECTRONIC COUNTING DEVICE

Richard H. Baker, Los Angeles, and Donald E. Eckdahl, Manhattan Beach, Calif., assignors to Northrop Aircraft Inc., Hawthorne, Calif., a corporation of California

Original application October 29, 1949, Serial No. 124,334, now Patent No. 2,630,448, dated December 2, 1952. Divided and this application November 13, 1952, Serial No. 324,534
1 Claim. (Cl. 250—27)

A stage of a quinary counter comprising three flip-flop circuits arranged in a cascade, said flip-flop circuits comprising dual tubes each having a grid and a plate, and being of the type capable of operation from one stable state to the other by a pulse applied at a common input point to its tubes or by a pulse applied at the grid of one of its tubes, an incoming circuit connected to the common input point of the first flip-flop and to the grid of the non-carry tube of the last flip-flop of said cascade, a carry pulse circuit from the plate of the carry tube of said first flip-flop to the common input point of said second flip-flop, a carry pulse circuit from the plate of the carry tube of said second flip-flop to the grid of the carry tube of said last flip-flop, a carry pulse feedback circuit from the plate of the carry tube of said last flip-flop, solely to the grid of the non-carry tube of said first flip-flop, said feedback circuit including a capacitor, whereby an output taken from the plate of the carry tube of either said second flip-flop or said last flip-flop yields one output pulse for every five input pulses on said incoming circuit.



---

2,773,984

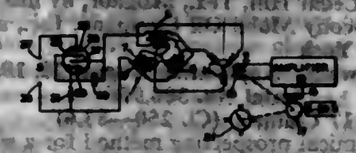
## AUTOMATIC PHASE OR FREQUENCY CONTROL SYSTEM

John Forrest Bigelow, Adams Township, Allen County, Ind., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland

Application December 18, 1950, Serial No. 201,350
3 Claims. (Cl. 250—36)

1. A line frequency sweep oscillator control system for television receivers, comprising a source of synchronizing pulses, a sine wave oscillator having feedback coupling coils coupled between the output and input of said oscillator, and variable reactance tube having an anode, a control grid and a cathode coupled across said coils for controlling the tuning of said oscillator, means for biasing said grid to a negative potential with respect to said cathode, a capacitive divider comprising two series condensers connected across one of said coils, a phase discriminator comprising a pair of rectifiers and a resistor between corresponding electrodes of said rectifiers, a connection between a point intermediate said condensers and one end of said resistor for applying energy from said oscillator to said discriminator, a coupling for applying pulses from said source to said discriminator across said rectifiers, whereby a voltage of magnitude and polarity dependent upon the degree and direction of departure

from synchronism between energy from said oscillator and said synchronizing pulses is derived in the output of said discriminator, and means for applying energy from the output of said discriminator to said control grid to synchronize said oscillator.



---

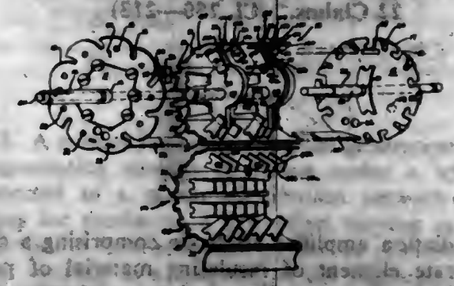
2,773,985

## FREQUENCY SUBDIVIDER IN A FLUX VALVE COMPASS SYSTEM

Charles E. Hanthorn and Robert H. Dunhil, Bergen, N. J., assignors to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware

Application December 17, 1952, Serial No. 326,550
2 Claims. (Cl. 250—36)

2. In a compass system utilizing a flux valve reference including an excitation winding, a frequency subdivider providing an output signal having a frequency which is a submultiple of the frequency of the signal applied to the input of said subdivider, said subdivider including an electron tube having at least a grid, a cathode and an anode, and a single capacitor having the dual function of tuning said excitation winding to the submultiple frequency desired and coupling a portion of the voltage of the submultiple frequency to said grid to provide bias to cut off said electron tube on alternate half cycles of signals applied to the anode.



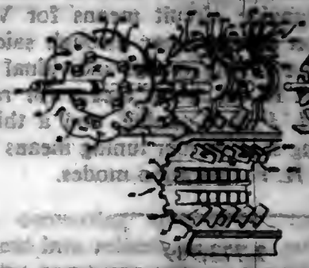
---

2,773,986

## FREQUENCY SELECTOR

Edwin Paul Thiss and Erich Feigl, Los Angeles, Calif., assignors to Standard Coil Products Co., Inc., Los Angeles, Calif., a corporation of Illinois

Application December 12, 1952, Serial No. 325,514
4 Claims. (Cl. 250—40)



1. A frequency selector adapted to receive individual frequencies in a plurality of U. H. F. bands comprising a stationary electric circuit and a band selecting turret, contact elements connected to said stationary electric circuit, said turret comprising a plurality of panels, tuning elements mounted in said turret and comprising variable capacitors, the stator plates of said capacitors being fixedly mounted on said panels, the contour and spacing of said stator plates of said variable capacitors varying for the different panels forming said turret, contact means mounted on said panels and connected to said tuning elements for selectively engaging the said contact elements of said stationary circuit for selecting a band at rotation of said turret, a shaft mounted in said turret, dielectric plates secured to said shaft and movable between pairs of said stator plates at rotation of said shaft for varying the capacitance across said stator plates and tuning in the same range of frequencies through the same angular displacement of said shaft regardless of the position of the said one band in the U. H. F. spectrum.

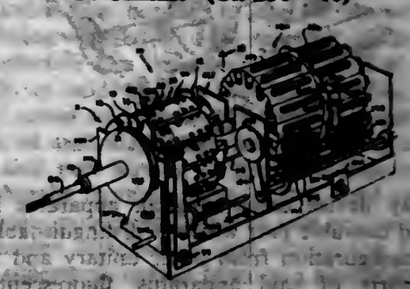
2,773,987

## FREQUENCY SELECTOR

Erich Feigl, Los Angeles, Calif., assignor to Standard Coil Products Co., Inc., Los Angeles, Calif., a corporation of Illinois

Application December 12, 1952, Serial No. 325,515
3 Claims. (Cl. 250—40)

1. A frequency selector adapted to receive individual frequencies in a plurality of U. H. F. bands comprising a stationary electric circuit and a rotatable turret, a plurality of contact elements connected to said electrical circuit, said stationary electric circuit comprising an input filter, said turret comprising a plurality of panels, tuning elements mounted on said panels, said tuning elements comprising variable capacitors, the plates of said capacitors being mounted on said panels; one of said plates being common to two of the said capacitors for the said filter, said capacitors being coupled to each other through said plate, the configuration of said plate determining the amount of coupling over the tuning range of said capacitors and thereby of said filter, a concentric shaft, dielectric plates mounted on said shaft and rotatable with said shaft, said dielectric plates being always positioned between said plates of said variable capacitors during rotation of said shaft, contact means connected to said tuning elements and mounted on each of said panels for selectively engaging said plurality of contact elements and predisposing said tuner to receive one of said bands at rotation of said turret, said dielectric plates through rotation of said shaft simultaneously varying said panel mounted variable capacitors and tuning said frequency selector for reception of one of said frequencies in the said one of said bands.



---

2,773,988

## FREQUENCY SELECTOR

Edwin Paul Thiss, Los Angeles, Calif., assignor to Standard Coil Products Co., Inc., Los Angeles, Calif., a corporation of Illinois

Application November 26, 1952, Serial No. 322,675
14 Claims. (Cl. 250—40)

1. A television tuner for receiving individual channels in the U. H. F. and V. H. F. signal bands comprising U. H. F. circuit means tunable to channels in the U. H. F. signal band, V. H. F. circuit means tunable to channels in the V. H. F. signal band, said U. H. F. and V. H. F. tunable circuit means being arranged along the same axis in tandem relation, an individual rotatable shaft member secured to each of said circuit means for respective selective tuning thereof, said shaft members being in concentric relationship, switch means in circuit with said U. H. F. and V. H. F. tunable circuit means, said

switch means being actuated through rotational displacement of one of said shaft members and arranged to circuitally connect the output of said U. H. F. tunable circuit means to the input of said V. H. F. tunable circuit means for U. H. F. band signal reception by the tuner through both of said circuit means, and to disconnect the output of said U. H. F. tunable circuit means from said second tunable circuit means for V. H. F. band signal reception by the tuner through said second circuit means, vernier tuning means individual to both said U. H. F. and V. H. F. circuit means for respective U. H. F. and V. H. F. fine tuning, and a third shaft member for operating said vernier tuning means for both the U. H. F. and V. H. F. operation modes.

## SHIELDING MEANS FOR ELECTRICAL TUNING DEVICES

Clifford D. Needeside, Packanack Lake, N. J., assignor to Allen B. Du Mont Laboratories, Inc., Clifton, N. J., a corporation of Delaware

Application October 15, 1952, Serial No. 314,854
4 Claims. (Cl. 250—40)

1. A tuning device comprising a circuit disk rotatable about an axis and having a contact pin thereon, means to rotate said disk, a shielding housing substantially enclosing said disk, an electric circuit unit positioned outside of and affixed to said housing, an opening through said housing, and an electric contact member extending from said circuit unit and through said opening and terminating at a point to selectively engage said contact pin at a predetermined position of said disk.

2,773,990

## STROBOSCOPIC DISPLAY DEVICES

Von D. Pelkunas, Plymouth, and Ledford M. Forbush, Ferndale, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application October 25, 1949, Serial No. 123,488
1 Claim. (Cl. 250—71)

A display device comprising an apparatus having a unitary and movable part which is distinguishable in outline and configuration from other unitary and relatively movable parts of said apparatus, fluorescent coating means on said part and covering the outline of said part when viewed from a remote point of observation, means for moving said part throughout an area greater than said outline and at a rate great enough to obscure observation of said outline from said point, ultraviolet light projecting means adapted to be located at said point of observation and to project ultraviolet light on said outline when said part is moving in said greater area, means for intermittently projecting said ultraviolet light from said means and upon said part as said part moves within said area and at a rate equal to a multiple of the rate of motion of said part within said area for indicating the outline of said part from said point of observation, and means for changing the rate of projection of said ultraviolet light to a different rate, said different rate being near enough to said equal multiple rate to indicate the outline of said part in motion at an apparent rate differing from the rate of motion of said part and rate of projection of said light and within a range in which the motion of said outline at said apparent rate will be discernible to an observer as a slow and continuous movement of said part within said greater area.

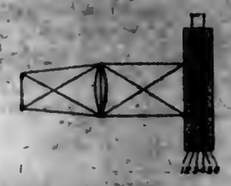
2,773,991

## METHOD OF GEOCHEMICAL PROSPECTING

Ellis E. Bray, Cedar Hill, Tex., assignor, by mesne assignments, to Socony Mobil Oil Company, Inc., a corporation of New York

No Drawing. Application August 28, 1952, Serial No. 306,956
17 Claims. (Cl. 250—83.6)

7. A geochemical prospecting method for a subterranean petroleum reservoir comprising collecting earth samples from a prospect area, extracting each of said earth samples with a solvent capable of desorbing and dissolving any extractable organic matter contained in said earth samples to obtain an extract from each of said earth samples, determining the weight of each of said extracts, and analyzing at least a representative sample of the extracts contained in the earth samples having anomalous weights of said extract and at least a representative sample of the extracts contained in the earth samples not having anomalous weights of said extract for the proportion of carbon therein having an atomic weight of 14 to carbon having an atomic weight of 12.



---

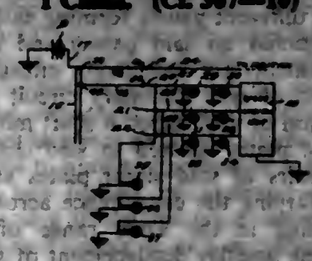
2,773,992

## DISPLAY AMPLIFIER AND METHOD OF MAKING SAME

Lee R. Ullery, Fort Wayne, Ind., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland

Application June 17, 1953, Serial No. 362,284
22 Claims. (Cl. 250—213)

3. A radiation amplifier electrode comprising a sheet-like perforate element of insulating material of predetermined thickness, and a film of photo-conductive material on the peripheral surfaces of the perforations of said element, said film extending from side to side of said element.



---

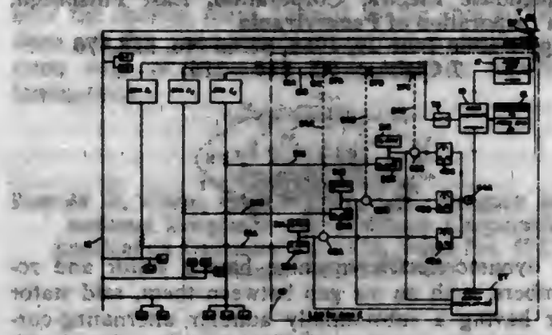
2,773,993

## SAFETY CONTROL FOR VEHICLES

Thomas Lincoln Rush, Ione, Mich.

Application January 15, 1953, Serial No. 331,373
1 Claim. (Cl. 307—10)

In combination, an electrically operated vehicle speed control unit, including a plurality of circuits, each limiting the vehicle to a selected maximum speed, a circuit closing means for connection with said unit, said means comprising a housing formed of opposite side walls, opposite end walls and a bottom wall, a U-shaped contact carried by the inner face of one end wall and extending lengthwise thereof, a terminal fixed to said contact and projecting through said one end wall, a plurality of spaced apart U-shaped contacts fixed to the inner face of the other end wall, a terminal fixed to each of said latter contacts and connected with said unit, a plurality of circuit making and breaking members selectively insertable in said housing, each member being formed of a relatively thin dielectric plate, a pair of contacts on one longitudinal edge of said plate engageable with said first named contact, a second pair of contacts on the opposite longitudinal edge of said plate spaced to engage one only of a selected pair of said plurality of contacts closing a particular one of the speed controlling circuits only, a pair of bridging conductors embedded in said plate and extending from one longitudinal edge thereof to the other longitudinal edge thereof connecting the contacts on one edge of said plate with the contacts on the opposite edge of said plate, and license indicating matter carried by one side of said plate.



---

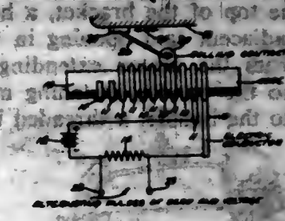
2,773,994

## CONTROL OF ELECTRICAL GENERATION

Nathan Cohn, Highland Park, Ill., assignor to Leeds and Northrup Company, Philadelphia, Pa., a corporation of Pennsylvania

Application March 26, 1953, Serial No. 344,838
34 Claims. (Cl. 307—57)

23. A system for controlling the generation of a group of generating sources operating under a schedule and connected to a power distribution network comprising means for producing a first effect varying as a function of deviation from schedule, means for producing a second effect varying as a function of the algebraic sum of the total generation of said sources and the summation of the base points of said sources, means for producing third effects each corresponding with the difference between the base point and the generation of the respective sources of the group, control means for varying the generation of said sources, means for predetermining the participation of said sources in the correction of said deviation and for predetermining the allocation of group regulation among said sources comprising first devices for distributing predetermined parts of said first and second effects among said control means and means for additionally applying to the respective control means the corresponding third effect, second devices for providing base-point settings of said sources, group generation responsive means for shifting the settings of said second devices and for concurrently preselecting a pair of settings for each of said first devices at discrete values of group generation, and means responsive to said second effect for selecting one or the other of each preselected pair of settings of said first devices depending upon whether the group generation is above or below the summation of the base points.



---

2,773,995

## SYSTEM FOR CONVERTING MECHANICAL MOVEMENT INTO A RELATED NUMBER OF ELECTRICAL PULSES

Lee M. Griswold, Pasadena, Calif.

Application June 22, 1953, Serial No. 363,175
10 Claims. (Cl. 307—96)

5. A converting system for converting mechanical movement into related electrical pulses, each of substantially the same intensity comprising a voltage source having a first terminal and a second terminal, an impedance, a pair of spirally-wound wires, one of said wires being bare and the other being insulated, a movable contact member arranged to contact, in its movement, said one wire and then said other wire in succession, said first terminal being connected through said impedance to said one wire, said second terminal being connected to said movable contact, said contact when in position to engage said one wire being effective to produce a current flow through said source, said impedance, a portion of said one wire, and said contact, and said contact when in position to engage said other wire serving to interrupt said current flow, and a pair of output terminals connected to corresponding opposite terminals of said impedance.

---

2,773,996

## TRANSDUCER FOR PRODUCING SOUND AT MICROWAVE FREQUENCIES

John Clarke Slater, Cambridge, Mass., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Application September 13, 1946, Serial No. 696,929
5 Claims. (Cl. 310—8.1)

1. In combination, a resonant cavity, means for energizing said resonant cavity with electromagnetic energy, a piezoelectric crystal, said crystal having as an electrode a conductive film bonded to one of its surfaces, said crystal being secured to said resonant cavity such that said conductive film constitutes a portion of one of the end walls of said resonant cavity, a flexible diaphragm disposed across said cavity, a conductive post secured to one side of said diaphragm and projecting toward said crystal, said post serving as the other electrode of said crystal thereby increasing the electric field acting across said crystal upon energization of said resonant cavity, an output means attached to said conductive film for extracting supersonic energy from said piezoelectric crystal.

---

2,773,997

## HANDLE MOUNTING FOR MOTOR DRIVEN POWER UNIT

Arthur W. Seyfried, Racine, Wis., assignor to Scovill Manufacturing Company, Waterbury, Conn., a specially chartered corporation of Connecticut

Application January 16, 1956, Serial No. 559,236
10 Claims. (Cl. 310—50)

10. A motor driven food mixer comprising a gear housing, a motor housing, a forward end cover on the

motor housing, a handle hollow at its forward end, a handle attachment bracket extending integrally forwardly from the motor end cover into the gear housing, said bracket having an internally hollow body communicating with the motor housing through a recess in the end cover, and communicating with the hollow handle through an opening in the top of the bracket, a handle supporting flat surface adjacent said opening in the top of the bracket, leads from the motor extending through said bracket body into the handle, fastening means connecting the bracket to the handle, a threaded bore extending

into the forward portion of the bracket beneath said handle supporting surface, the upper wall of the gear housing being cut away to fit around the forward end of the handle, a bolt extending through the face of the gear housing into said threaded bore in the bracket and thereby connecting the gear housing to the motor end cover, an upwardly and rearwardly open recess formed in the rear end of the motor housing, a pin projecting from the motor housing into the recess, and an aperture in the rear end of the handle adapted to receive the pin and thereby concealedly fasten the handle to the motor housing.

---

2,773,996

**ARMATURES FOR INDUCED CURRENT TORQUE TRANSMITTING APPARATUS**

Henry S. Jacobs, Shorewood, and Jeremiah M. Curtin, Milwaukee, Wis., assignors to Harnischfeger Corporation, Milwaukee, Wis., a corporation of Wisconsin

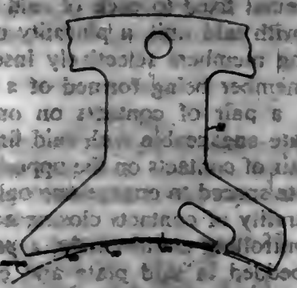
Application March 1, 1954, Serial No. 413,996

7 Claims. (Cl. 310—105)

1. In an armature for an induced current torque transmitter the combination of a drum of magnetic material having a circumferential face forming an air gap surface concentric with an axis of rotation, a plurality of circumferentially spaced inductor bars of low resistivity supported by said drum having axially extending ends projecting from said drum, a plurality of electrically conductive laminated cooling fins of a resistance substantially greater than that of one of said inductor bars each having a current conducting lamina of copper and a second current conducting lamina of strength imparting ferrous material adjacent and supporting said copper lamina, and connections joining said cooling fins between the ends of said inductor bars with each fin forming an extension of an associated bar to provide current paths for the flow of inductor bar currents which are limited in value by said cooling fins.

---

2,773,999



**SHADED POLE MOTOR**

Wayne J. Morrill, Garrett, Ind.

Application January 16, 1952, Serial No. 266,755

6 Claims. (Cl. 310—172)

1. A permeable stator lamination for a shaded pole induction motor comprising, an annular ring, an even number of pole pieces extending inwardly from said ring, a neck and a pole face portion on each pole piece, each pole face portion having first and second sides and defining substantially an arc of a circle, all of said substantial arcs defining a substantially circular opening to closely receive an induction motor rotor, a surface defining a slot in each of said first sides to accommodate a shading coil, said second sides having first and second

portions with all said first portions being circular arcs having substantially the same center, said second portions being a straight edge substantially tangent to said arc whereby the air gap between the pole face portion and a rotor is non-uniform and increases substantially tangentially toward the extremities of said second sides, and each of said straight edges defining approximately fifty electrical degrees of said stator lamination.

---

2,774,009

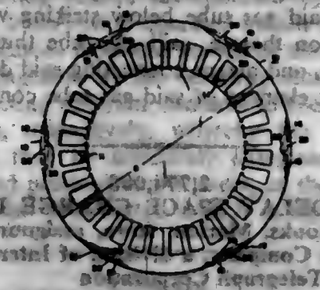
**ORIENTED-STEEL STATOR-CORES**

Malcolm D. Rose, Churchill Borough, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application June 29, 1955, Serial No. 518,870

7 Claims. (Cl. 310—216)

1. A dynamo-electric machine having stator and rotor members, with an air gap between them, said stator member having a substantially annular alternating-current armature-core having winding-receiving slots in its bore, said core including a plurality of solidly adhering stacked punching-layers and then interposed bonding-layers of a substantially non-conducting solid bonding-material holding said stacked punching-layers solidly together, said punching-layers being made up of material in the form of separate pieces including segmental core-punchings and radial tooth-punchings of oriented magnetic sheet-material, said tooth-punchings being circumferentially spaced from each other by the several winding-receiving slots of the core, at least some of the segmental core-punchings of at least some of the stacked punching-layers having an arcuate span embracing a plurality of winding-receiving slots and having grain-orientation approximately in the circumferential direction, the tooth-punchings having grain-orientation approximately in the radial direction, at least some of the tooth-punchings of at least some of the punching-layers including portions extending back into overlapping relation with respect to portions of the segmental core-punchings in an adjacent punching-layer for providing bonded side-surface joints which contribute substantially to the bonding-strength of the core-assembly, portions of at least some of the segmental core-portions of at least some of the punching-layers being in overlapping relation with respect to portions of the segmental core-punchings in an adjacent punching-layer for providing bonded side-surface joints which further contribute substantially to the bonding-strength of the core-assembly.



2,774,021

**MOTOR STATOR LAMINATIONS AND METHOD OF MANUFACTURING WELDED STATORS**

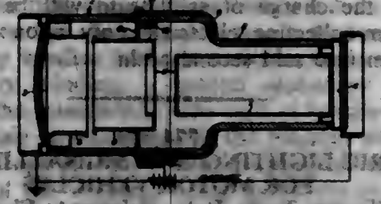
Walter W. Riedel, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application March 2, 1954, Serial No. 415,831

5 Claims. (Cl. 310—217)

1. A dynamo-electric machine core member formed of generally circular laminations having winding slots in one edge and spaced chordal edge portions in the opposite edge thereof, a narrow tooth projecting from the chordal edge portions of each lamination of not greater height than a perpendicular on the cord on the radius of the lamination to the arc of the segment formed by the cord and a slot adjacent the tooth extending into the laminations from the chordal edge portions and forming with other teeth and slots of adjacent laminations in the core assembly a tooth ridge with a slot thereadjacent extending longitudinally parallel with the axis of the core over the chordal plane formed by the chordal edge portions of the core laminations, and a weld along the outer edge of the tooth ridge securing together said laminations.

---



2,774,082

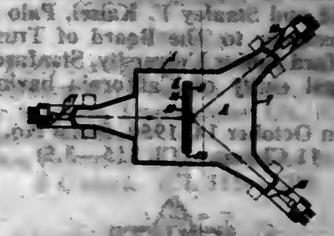
**IMAGE TUBE**

Donald E. Carle, Fort Wayne, Ind., assignor to International Telephone and Telegraph Corporation

Application December 21, 1953, Serial No. 479,773

2 Claims. (Cl. 313—65)

1. An electron image tube comprising a glass envelope of tubular shape, a photoelectric cathode in one end of said envelope capable of emitting an electron image in response to a radiant energy image, an anode screen in the other end of said envelope which emits light in response to electron impingement, at least one tubular electrode element in said envelope between said cathode and anode and being disposed coaxially with respect to the electron beam which extends from said cathode to said anode, said element having a metallic support which is secured to said envelope, said element being axially spaced from said anode thereby providing a space for said beam which is not surrounded by a tube electrode element, and a conductive shield on the outer circumferential surface of said envelope in radial registry with the space between said element and said anode, said shield being conductively connected to said element and thereby providing a conductive tubular enclosure for said space for compensating for any wall charge on the tube envelope which may laterally deflect said beam.



2,774,083

**COLOR TELEVISION KINESCOPES**

Hanbold W. Leverenz, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application December 20, 1952, Serial No. 327,102

9 Claims. (Cl. 313—92)

1. In combination, an electron-sensitive screen comprising a surface area constituted essentially of a single phosphor material of a type capable of alternately and repeatedly emitting light of one color under one excitation density and light of a different color under a different excitation density, and means for bombarding said single phosphor material selectively with energy of said different excitation densities.

---

2,774,084

**FLEXIBLE ELECTROLUMINESCENT LAMINATED PANEL**

Mary S. Jaffe, Cleveland Heights, Ohio, assignor to General Electric Company, a corporation of New York

Application April 8, 1953, Serial No. 347,575

2 Claims. (Cl. 313—108)

1. A flexible electroluminescent panel comprising a flexible fibrous glass sheet made of glass fibers individually enveloped in a light-transmitting electrically conductive coating formed thereon, a layer thereover of an electroluminescent phosphor dispersed in a dielectric material adherent to said sheet, and a layer thereover of a conductive material adherent to said dielectric material.

---

2,774,085

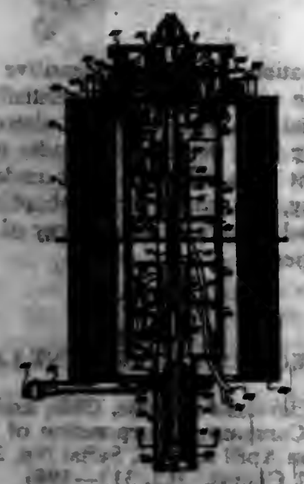
**SLOW-WAVE STRUCTURES FOR TRAVELLING WAVE TUBES**

Benjamin Kazan, Long Branch, N. J., assignor to the United States of America as represented by the Secretary of the Army

Application October 3, 1951, Serial No. 249,611

5 Claims. (Cl. 315—3.5)

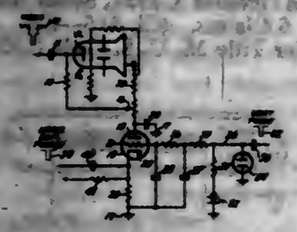
(Granted under Title 35, U. S. Code (1952), sec. 266)



1. In a travelling wave tube having an electron source at one end thereof and a collector anode at the other end, an electromagnetic wave slowing structure comprising a wire mesh cylinder intermediate said electron source and said collector anode, means associated with said electron source for propagating an electron stream through the longitudinal axis of said wire mesh cylinder, and means for propagating an electromagnetic wave along the sur-

face of said wire mesh cylinder whereby amplification of said propagating wave is achieved by the interaction of said wave and said electron stream.

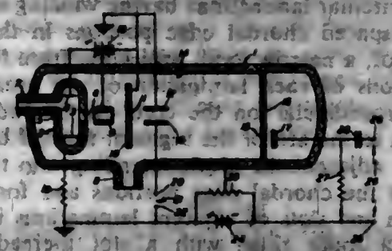
---



2,774,006
**TRAVELLING WAVE TUBE APPARATUS**
Lester M. Field and Stanley F. Kaisel, Palo Alto, Calif.; said Field assignor to The Board of Trustees of The Leland Stanford Junior University, Stanford University, Calif., a legal entity of California having corporate powers
Application October 14, 1950, Serial No. 190,229
11 Claims. (Cl. 315—3.5)

10. A travelling wave tube including a cathode, a collector, and means for propagating a slow electromagnetic wave along a path between said cathode and said collector, said wave propagating means having an input coupling means at one end thereof and an output coupling means at the other end, an evacuated envelope enclosing said cathode and wave propagating means, said envelope having a first substantially cylindrical metallic portion, supporting means fixed to said cylindrical portion and arranged to support said wave propagating means, said envelope having a further cylindrical metallic portion connected to and supported by said first metallic portion and forming said collector, and two electromagnetic wave transmission means entering said first cylindrical metallic portion at regions near the collector and being respectively connected to said input and output coupling means.

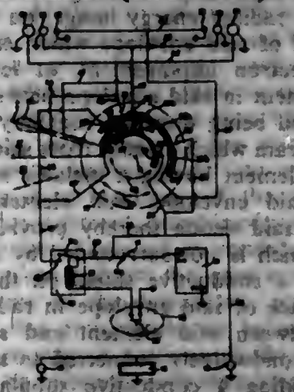
---



2,774,007
**BEAM CUT-OFF CIRCUIT**
John F. Bigelow, Fort Wayne, Ind., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland
Application June 27, 1952, Serial No. 296,037
9 Claims. (Cl. 315—20)

1. In a protective circuit for a cathode ray tube having a beam source, beam deflection means, and a deflection pulse source whereby the absence of said pulses results in extinguishment of the beam, an electron discharge device operative between a state of conduction and a state of non-conduction connected for the control of said beam in response to the presence or absence of deflection pulses, and means to initiate and terminate conduction through said discharge device in response to the presence or absence of applied deflection pulses including a two element gas tube series connected between the grid and cathode of said control tube, a resistor shunting said gas tube, means maintaining the elements of said gas tube biased below striking voltage of said gas tube and at a level such that applied pulses of predetermined minimum height and a given polarity render said tube conducting while pulses of like height and opposite polarity lower the normal bias of said gas tube below striking voltage to prevent conduction therein, said gas tube thus serving as a diode rectifier, and means connecting said deflection pulse source to that element of said gas tube connected to said grid.

---

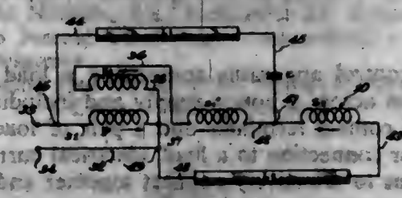


2,774,008
**TIME DELAY SPACE CHARGE DEVICE**
Howard B. Rooks, Marion, Iowa, assignor to Capehart-Farnsworth Company, a division of International Telephone and Telegraph Corporation
Application August 26, 1953, Serial No. 376,665
8 Claims. (Cl. 315—21)

1. A time delay space charge device comprising a source of commonly charged ions, electrode means associated with said source for forming a beam comprised of said ions and for directing said beam along a predetermined path, beam-deflecting means associated with said electrode means and operative to deflect said beam from said predetermined path into a second path, an anode electrode spaced from said beam-deflecting means and having a beam-intercepting surface disposed in said predetermined path and an aperture in said surface in registry with said second path, and a beam-collecting electrode mounted opposite said aperture so as to collect the charge of said beam after it passes through said aperture whereby the charge of said beam will be collected by said beam-collecting electrode only upon deflection of said beam into said second path.

---

2,774,009
**ELECTRIC LIGHTING AND SIGNALLING PLANT FOR MOTOR VEHICLES**
Dante Giacosa, Turin, Italy, assignor to Fiat Societh per Azioni, Turin, Italy
Application May 14, 1954, Serial No. 429,875
Claims priority, application Italy December 23, 1953
2 Claims. (Cl. 315—83)



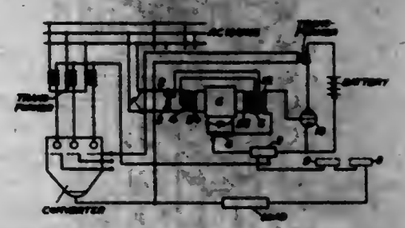
1. Electric lighting plant for motor vehicles comprising a source of current, at least one set of outer lights including a city light, a crossing light and a country light, a first energizing circuit between the lights and the source comprising lead-in conductors, a three-position change-over switch, and change-over sectors incorporated by the switch for selectively energizing from the source the city light, crossing light and country light in a first, second and third position, respectively, of the switch; and a second energizing circuit in parallel with the said first circuit including selecting sectors incorporated by the change-over switch, a push-button operated switch for energizing the selecting sectors from the source of current, contacts selectively engageable by the selecting sectors, and conductors connecting different contacts to the crossing and country lights, respectively, whereby the crossing and country lights may be selectively energized in the said first and second position, respectively, of the change-over switch when the push-button switch is operated.

---

2,774,010
**APPARATUS FOR STARTING AND OPERATING GASEOUS DISCHARGE DEVICES**
Albert E. Feinberg, Chicago, Ill., assignor to Advance Transformer Co., Chicago, Ill., a corporation of Illinois
Application October 13, 1951, Serial No. 251,197
21 Claims. (Cl. 315—138)

1. Apparatus of the character described and including a plurality of gaseous discharge devices, a low voltage source of alternating current, means for igniting and thereafter operating said gaseous discharge devices from said source which comprise, a transformer core and a choke core forming two separate magnetic circuits one in each respective core, a primary winding mounted on the transformer core, a composite starting winding having two parts, one part comprising a first secondary winding mounted on the transformer core in close coupled voltage-inducting relationship with the primary winding and the second part comprising a highly inductive winding mounted on the choke core in non-inductive relation to the primary winding and connected in series with said first secondary winding, a second secondary winding mounted on the transformer core and in loosely coupled voltage-inducing relationship with the primary winding to have high leakage reactance during operation of the apparatus, all of the windings being connected end to end in the order hereinabove named, a condenser, the primary winding being connected across the source, one of said gaseous discharge devices being connected in a loop across windings of said apparatus including said condenser in series and at least the starting winding but excluding the second secondary winding, and a second gaseous discharge device being connected in a second loop across windings of said apparatus including at least said starting winding and said second secondary winding, the open circuit voltage relationship between the secondary windings in the second loop being bucking, the turn relationship between the primary winding and the windings of the first loop being such as to provide sufficient induced voltage therein to first ignite the first gaseous discharge device when the primary winding is energized from the source, the second part of the composite starting winding having no contributing voltage to aid in the starting of the first gaseous discharge device, and there being a voltage produced in the said second part of the composite starting winding after the ignition of the first device which causes flow of current through the said first loop, the relationship between said last mentioned voltage and the open circuit voltage of the second secondary winding being additive whereby after ignition of the first device the resultant voltage of the windings of the second loop will be sufficient to ignite the second gaseous discharge device.

---

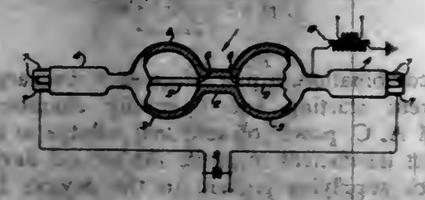


2,774,011
**BALLAST FOR GASEOUS DISCHARGE DEVICES**
Albert E. Feinberg and Frank S. Rado, Chicago, Ill., assignors to Advance Transformer Co., Chicago, Ill., a corporation of Illinois
Application February 23, 1952, Serial No. 273,111
6 Claims. (Cl. 315—138)

4. In combination, a pair of gaseous discharge devices of different starting and operating characteristics, a source of A. C. power of sufficient volatge to ignite one device but insufficient to ignite the second device and a ballast for supplying current to the devices from said source comprising an elongate outer shell and a central winding leg, a primary winding, a secondary winding and a choke winding all mounted on the winding leg, the choke winding being connected in series with the one device and together therewith connected across the primary, the primary and secondary windings being connected in autotransformer relationship with the second device, said shell having a pair of extensions integral with opposite long sides thereof and terminating against the central winding leg to form a magnetic short circuit therebetween, the choke and primary windings being positioned on opposite sides of the extensions and their voltage senses being additive during operation of the gaseous discharge devices to produce flux travelling through the central winding leg in the same direction, but through the extensions in opposite directions such that the flux density in the short circuit will be considerably less than the sum of flux densities due to the respective windings considered separately, said primary winding having leads connecting same to said source, the central winding leg having one end engaging the shell in closed magnetic circuit relation at the end adjacent the secondary winding and having the opposite end spaced from the shell to form an air gap adjacent the choke winding.

---

2,774,012
**CONTROL MEANS FOR STATIC CURRENT CONVERTERS**
Uno Lamm and Erich Uhlmann, Ludvika, Sweden, assignors to Allmanna Svenska Elektriska Aktiebolaget, Vasteras, Sweden, a corporation of Sweden
Application May 28, 1953, Serial No. 358,074
Claims priority, application Sweden June 4, 1952
16 Claims. (Cl. 315—146)



1. Control system for a polyphase static power converter, comprising a first means with input terminals for

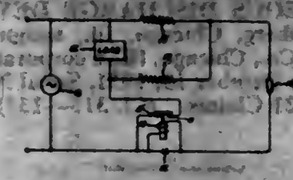
delivering an igniting impulse to said converter at an instant being determined by a voltage applied to said input terminals, a second means influenced by the load current of said converter, and producting a voltage substantially proportional to said load current, and a third means influenced by the voltage between a relieved phase and a relieving phase of said converter and producing a voltage substantially proportional to the peak value of the voltage between said phases, the output voltages of said second and said third means being series connected to said input terminals of said first means.

---

2,774,613
ELECTRIC DISCHARGE LAMP
Anthony H. Willoughby, Bishopsworth, England, assignor to General Electric Company, a corporation of New York
Application March 23, 1950, Serial No. 151,440
Claims priority, application Great Britain April 7, 1949
2 Claims. (Cl. 315—241)

1. A gaseous electric discharge lamp for producing intense flashes of light of very short duration and comprising a quartz envelope substantially of dumb-bell shape and containing a filling of ionizable gas at a pressure not less than about 500 millimeters, the axial length of the bar portion of said dumb-bell shaped envelope being less than 2 cms., the mean internal diameter of said bar portion being less than 1 cm. and less than the length thereof, the bulbous ends of said envelope having a mean internal diameter not less than 2 cms. and a volume considerably greater than the volume of said bar portion, and an electrode in each said bulbous end of the envelope having its discharge termination surface adjacent to the corresponding end of the said bar portion of the envelope to define a discharge path therebetween not more than 2 cms. long, and means including a source of electrical energy for impressing between the electrodes a brief voltage pulse of magnitude sufficient to produce an intense flash of light through the gas in said bar portion with concomitant creation of a high pressure shock wave, said bulbous ends providing expansion chambers for reducing shock to the envelope due to heating and expansion of the gas filling.

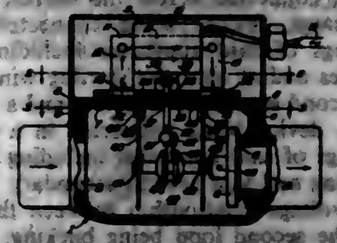
---



2,774,614
MODULAR ELECTRONIC ASSEMBLY
Robert L. Henry, Jr., Silver Spring, Md., assignor to the United States of America as represented by the Secretary of the Navy
Application October 31, 1952, Serial No. 318,148
14 Claims. (Cl. 317—101)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A modular electrical circuit assembly comprising a plurality of wafers, each of said wafers being of substantially the same size and outer configuration and having a plurality of peripherally located notches therein, said wafers being disposed in separate parallel planes and being in alignment, the corresponding notches in each wafer also being in alignment, a plurality of conductors, each conductor located in aligned notches in said wafers and secured to said wafers, said conductors retaining said wafers spaced from each other to thereby provide air spaces between each wafer, at least some of said wafers having a circuit component thereon and connected to said conductors, and said conductors together with the circuits on said wafers forming the electrical circuit of said assembly.

---



2,774,615
PHOTOELECTRIC CONTROL APPARATUS
William C. White, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application April 25, 1953, Serial No. 350,709
8 Claims. (Cl. 317—129)

1. A control apparatus comprising a load circuit for connection across a power supply and including in series a pair of contact terminals and a pair of load input terminals for connection to a load, electrical current responsive means to selectively connect together and to disconnect said contact terminals, a first current limiting resistance, an impedanced evice having an impedance variable in accordance with an external stimulus, said means, said device, and said first resistance being connected in a series circuit in the order named across said load circuit, and a second resistance connected at one end to said load circuit between said terminals and said contacts and at the other end to said series circuit between said device and said first resistance to provide for positive action of said apparatus to control the energization of said load relative to a predetermined magnitude of said stimulus.

---

2,774,616
ELECTROMAGNETIC CONTROL DEVICE
Russell B. Matthews, Wauwatosa, and John H. Thornbury, Whitefish Bay, Wis., assignors to Milwaukee Gas Specialty Company, Milwaukee, Wis., a corporation of Wisconsin
Application August 26, 1952, Serial No. 306,444
8 Claims. (Cl. 317—167)

4. An electromagnetic operator comprising a magnetically permeable base plate, a magnetically permeable frame of inverted generally U-shaped configuration mounted on one side of said base plate and having legs, the ends of which afford magnetically permeable pole faces presented toward and spaced from said base plate to provide a pair of coplanar air gaps therebetween and at least one transverse portion magnetically connecting said legs, a winding on said frame which when energized is adapted to produce magnetic flux in said frame and

across said air gaps and through said base plate, an electrical conducting armature in the form of a flat member connected to impart turning movement to a shaft about an axis disposed generally parallel to the direction of spacing of said pole faces of said frame from said base plate, said shaft projecting through and mounted for turning movement in said base plate, and an actuated device mounted on the opposite side of said base plate and operatively connected to said shaft for actuation by turning movement of said shaft, said armature having a pair of armature portions, one operating in each of said air gaps with each of said armature portions exposed to the adjacent pole faces of said frame on one side and to said base plate on the opposite side, each said armature portion having electric current induced therein by magnetic flux across said air gaps and the electric current induced in each of said armature portions producing a flux reacting directly with the flux across said air gaps to impart by the combined effect of said fluxes turning movement by reaction of said armature about the axis of said shaft.

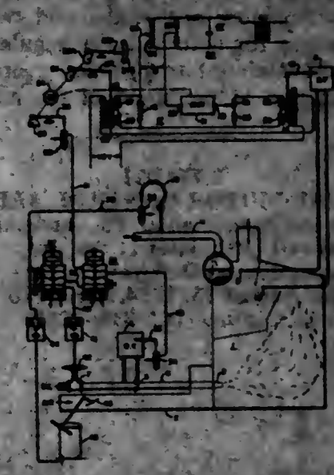
2,774,617
TRIMMER
Milton J. Shapp, Merion Station, and Henry J. Arbeiter, Conshohocken, Pa., assignors, by mesne assignments, to Jerrold Electronics Corporation, a corporation of Delaware
Application January 12, 1954, Serial No. 404,633
4 Claims. (Cl. 317—249)

1. A trimmer capacitor comprising a first conductive plate element comprising an elongated metallic body having an internally threaded bore, a dielectric mounted on said first conductive element, a second conductive plate element mounted on the dielectric, and a metallic plug threaded for a portion of its length and smooth and cylindrical for a portion of its length, and mounted inside the bore for controlled movement toward and away from the second plate element whereby the capacitance of the device may be varied, the plug being maintained in firm electric contact with the first plate element by spring contact at a point closer to the second plate element than the threaded contact, the spring contact being maintained between conductive contacts integral with the first plate element and the smooth portion of the plug.

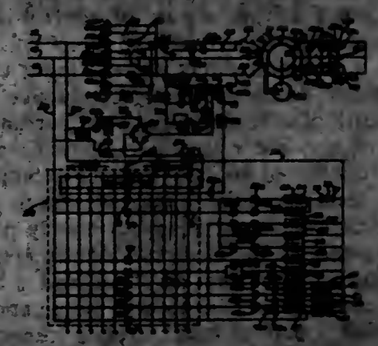
---



2,774,618
CONDENSER
Felix Weiss, Brookline, Mass., assignor to Cornell-Dubilier Electric Corporation, a corporation of Delaware
Application September 29, 1953, Serial No. 382,075
3 Claims. (Cl. 317—249)

1. An aluminum condenser comprising a wound composite roll of interleaved insulating and conductive strips with the ends of the insulating strips extending beyond the ends of the conductive strips to form a peripheral binding portion, and deposits of conductive material along the ends of said insulating strips penetrating said ends and adsorbed by the material thereof so as to form masses of impregnating adhesive cementing the strip ends to each other and to the preceding underlying layer and fastening the condenser roll in wound condition.

---



2,774,619
ELECTRIC SERVO SYSTEM FOR MEASURING AND CONTROL
Anthony J. Hornfeck, South Euclid, Ohio, assignor to Bailey Meter Company, a corporation of Delaware
Application January 26, 1951, Serial No. 233,187
24 Claims. (Cl. 318—28)

11. A balanceable network including one set of secondaries for each of two movable core transformers having primaries, a second set of secondaries for one of said transformers, a common source of electrical potential for the primaries of said transformers, said second set of secondaries supplying a constant voltage output, means for selecting a portion of said constant voltage output, means for injecting said selected voltage output into said balanceable network to unbalance it, and motor means including amplifier and motor control means for rebalancing the network, whereby the balance position of the core of one of the movable core transformers is biased in relation to the position of the core of the other movable core transformer in accordance with the amount of said selected voltage.

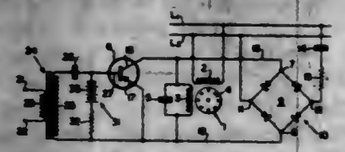
2,774,620
OVERDRIVE CONTROL AND BRAKING SYSTEM
Milton W. Gobbie and George R. Merchant, Madison, Ohio, assignors to The Eaton Electric & Manufacturing Company, Madison, Ohio, a corporation of Ohio
Application August 6, 1954, Serial No. 447,909
11 Claims. (Cl. 318—265)

1. Alternating current hoist apparatus comprising, in combination, a three-phase, wound rotor induction mo-

tor having rotor windings and three rotor terminals therefor and stator windings and three stator terminals therefor, three three-phase alternating current power leads, means for connecting two of the power leads directly to two of the stator terminals to apply alternating current voltages to those terminals, a line rectifier, and means for connecting the said line rectifier from the third power lead to the third stator terminal of the motor to apply rectified alternating current voltages to the stator windings, a shunt circuit, and means for connecting the said shunt circuit to one of the said two stator terminals and to the third stator terminal for producing circulating currents in the stator windings, the said shunt circuit including a series rectifier connected in opposition to the first-named rectifier for maintaining high impedance paths between the power leads, and passing rectified alternating currents through the stator winding connected to the remaining one of the said two stator terminals, and means for automatically regulating the currents in the shunt circuit to produce a braking torque which is a function of the speed of the motor.



---

2,774,821

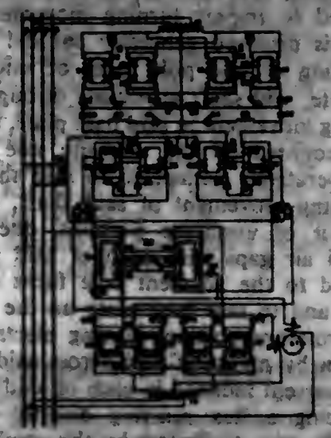
## ELECTRICAL MOTOR CONTROL APPARATUS

Robert J. Ehret, Philadelphia, Pa., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

Application August 16, 1954, Serial No. 449,947
11 Claims. (Cl. 318—287)

1. In combination, a single stage common emitter transistor amplifier, having an input and an output, biasing means connected to the input of said amplifier for rendering it conductive in the absence of an input signal, a two phase reversible induction motor having a power winding and a control winding, said power winding being adapted to be connected to a source of alternating current, circuit means connecting said control winding in shunt with the output of said amplifier, and a power supply, said power supply having an impedance of such magnitude with respect to the magnitude of said transistor and said motor control winding that changes in the impedance of said transistor will not produce appreciable changes in the current flowing from said power supply.

---



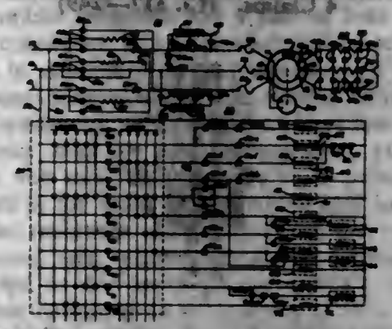
2,774,822

## MOTOR CONTROL SYSTEM

Franklin S. Mallet, Milwaukee, Wis., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application June 15, 1953, Serial No. 361,653
5 Claims. (Cl. 318—227)

1. A two phase motor control system comprising, a two phase motor having a pair of control windings, a pair of amplifiers having respective direct current output circuits and a common direct current input circuit, said pair of amplifiers being selectively conductive in dependence of polarity of said common direct current input circuit, a pair of non-linear amplifiers having respective input circuits connected to said respective output circuits and having respective direct current output circuits in which the electrical output is approximately proportional to the square root of the electrical input thereto, reversible phase alternating current amplifier means having output circuit means connected to one motor control winding and having a pair of input circuits respectively connected to said respective direct current output circuits of said non-linear amplifiers, and a non-reversing phase, alternating current amplifier having an output circuit connected to the remaining motor control winding and having a pair of input circuits respectively connected to said respective direct current output circuits of said non-linear amplifiers.



---

2,774,823

## OVERDRIVE CONTROL AND BRAKING SYSTEM

Milton Wesley Griffin, Madison, Ohio, assignor to The Euclid Electric & Manufacturing Company, Madison, Ohio, a corporation of Ohio

Application May 18, 1954, Serial No. 430,516
26 Claims. (Cl. 318—332)

1. Alternating current hoist apparatus comprising, in combination, a three-phase, wound rotor induction motor having rotor windings and three rotor terminals therefor, and stator windings and three stator terminals therefor, three three-phase alternating current power leads, means connecting two of the power leads directly to two of the stator terminals to apply alternating current voltages to those terminals, a rectifier, and means connecting the said rectifier from the third power lead to the third stator terminal for applying rectified alternating current voltages to that terminal to produce rectified alternating currents through the said terminal and stator windings, and means connecting a shunt circuit from one of the first two stator terminals to the said third stator terminal for circulating alternating currents from the said first-named terminal to the said third terminal, the said shunt circuit including a series rectifier connected in opposition to the first-named rectifier and the said third power lead for maintaining high impedance paths between the power leads and passing rectified alternating currents through the stator winding connected to the remaining one of the said two stator terminals.

---

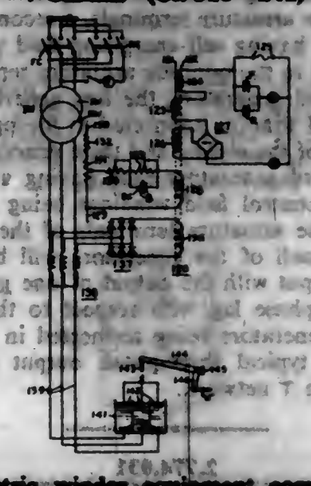
2,774,824

## MULTISPEED INDUCTION MOTOR

Allen A. Braunworth, Cortland, Ill., assignor to General Electric Company, a corporation of New York

Application October 11, 1955, Serial No. 539,711
6 Claims. (Cl. 318—224)

1. A multispeed alternating current induction-type motor having a stator core, at least two main windings arranged on said core, the first of said windings being arranged to form a predetermined number of poles, the second of said windings being formed of at least two sections, one of said sections being connectable to the other of said sections in two different relationships, said sections being arranged to form a second predetermined number of poles in the first of said relationships and to form the same predetermined number of poles as said first winding in the second of said relationships, said poles of said second winding being respectively physically displaced from the poles of said first winding when said sections are connected in the second of said relationship, means for connecting said windings in parallel and said sections in said second relationship up to a predetermined speed of rotation of said motor, and means for selecting one of said windings for energization above said predetermined speed, said sections being connected in said first relationship when said second winding is selected.



---

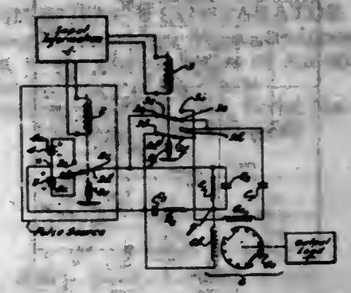
2,774,825

## ELECTRICALLY OPERATED HOISTS, WINDERS, AND THE LIKE

Leo Abram, Sale, and Richard Hathaway, Swinton, England, assignors to Metropolitan-Vickers Electrical Company Limited, London, England, a British company

Application June 16, 1954, Serial No. 437,784
7 Claims. (Cl. 318—241)

1. An electric winder equipment comprising a slip-ring induction motor, a resistance controlling said motor, a fluid pressure servomotor coupled mechanically with said resistance for adjusting the value of said resistance, a control valve and a control member connected thereto for governing the fluid pressure applied to said servomotor, valve means movable between a normal condition applying normal fluid pressure to said servomotor and effecting maximum rate of movement of said servomotor to reduce said resistance and a second condition applying reduced fluid pressure to said servomotor and effecting a reduced rate of movement of said servomotor to reduce said resistance, electro-magnetic operating means coupled with said valve means and responsive to motor current to actuate said valve means from said normal condition to said second condition in response to the motor current reaching a predetermined value, and opposing means for said valve means coupled with said servomotor and actuating said valve means from said normal condition to said second condition when the servomotor is actuated to a position near the minimum resistance position to thereby apply said reduced rate of movement of the resistance independently of the motor current during movement of the resistance from said position to the minimum resistance position.



---

2,774,826

## DIGITAL SERVOMOTOR

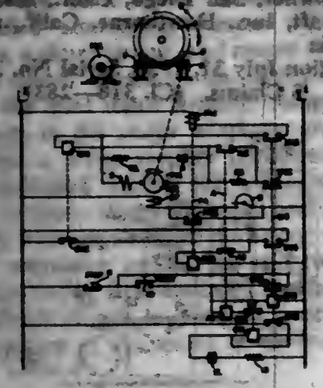
George H. Towner, San Diego, Calif., assignor to Northrop Aircraft, Inc., Hawthorne, Calif., a corporation of California

Application July 31, 1953, Serial No. 371,625
5 Claims. (Cl. 318—283)

1. A digital servomotor, comprising: a two phase servomotor responsive to a pulse input thereto by a discrete and finite amount of output shaft rotation for each input pulse, one of the phase windings having a capacitance connected in series therewith to provide a transient pulse of input voltage applied thereto; a first and a second D. C. power source, said D. C. power sources connected serially in additive polarity; a single pole, two position relay operable by external input information signals, said serially connected first and second power sources connected across the two position terminals of said single pole, two position relay, the pole of said single pole relay being actuated by said input information signals momentarily from a normal position terminal to the other position terminal and back to produce a pulse output of sufficient magnitude and width to drive said servomotor; a parallel resistance-capacitance combination connected in series with the other phase winding of said two phase servomotor, one end of said latter series combination connected to the pole of said single pole relay, the other end being connected to the common junction of said serially connected first and second power sources, said parallel resistance-capacitance combination limiting the rotor locking current through said other phase winding when the pole of said single pole, two position relay is on said normal position terminal; and a double pole, two position relay operable by external input information signals, one pole being connected to the pole of said single pole relay and the other pole of said double pole relay being connected to the common junction of said serially connected first and second power sources, said phase winding having a capacitance connected in series therewith being connected to a normal position terminal of one pole and to the other position terminal of the other pole of said double pole relay, said series capacitance being connected to the remaining two position terminals of said double pole relay, whereby operation of said double pole, two position relay reverses the direction of output shaft rotation by reversing current flow through said phase winding having a series capacitance.

---

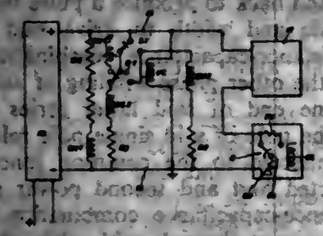
2,774,827



## BRAKING CONTROL SYSTEM FOR ELECTRIC MOTORS

Robert N. Eck, Whitefish Bay, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware

Application March 22, 1954, Serial No. 417,584
5 Claims. (Cl. 318—379)

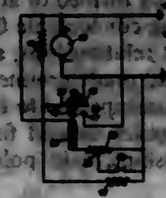


1. In combination, a source of D. C. voltage, a D. C. motor having a shunt field, means for selectively con-

necting the armature of said motor across said source for running in the forward direction and disconnecting the same for stopping, a circuit including a unidirectional conducting device connected in parallel with the armature of said motor, said device being so poled as to provide flow of braking current only when said motor rotates in the reverse direction, means providing maximum energization of said shunt field for starting and another given lower level of energization a predetermined interval following starting, and means in circuit with the last mentioned means and responsive to armature counter-voltage to prevent establishment of maximum energization connections for said field by said last mentioned means until said motor counter-voltage decreases below a given level.

---

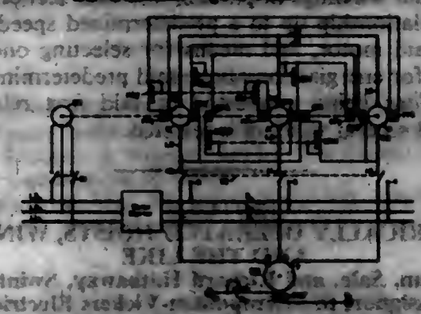
2,774,928
TIMER
John C. Hutchinson, Toronto, Ontario, Canada
Application September 30, 1955, Serial No. 537,835
4 Claims. (Cl. 320—23)



1. A battery charger control system energizable by a direct current source or by a battery having a predetermined charge providing a charge rate circuit and a finish rate circuit for such battery, direct current supply means for charging said battery, said system being biased toward said charge rate circuit when de-energized, means for switching from said charge rate circuit to said finish rate circuit, responsive to a predetermined battery charge or a predetermined charge time, means to disconnect said direct current supply in response to a predetermined finish rate time, said means being operable to reestablish said direct current supply only on de-energization of said system.

---

2,774,929
VOLTAGE REGULATORS FOR DYNAMO-ELECTRIC MACHINES
Hermann Mälzer, Stuttgart-Botnang, Germany, assignor to Robert Bosch G. m. b. H., Stuttgart, Germany
Application April 18, 1951, Serial No. 221,924
Claims priority, application Germany April 18, 1950
7 Claims. (Cl. 322—28)



1. A voltage output regulator for dynamo-electric machines driven at variable speeds, including in combination a current regulator, a voltage regulator, a regulating resistance in the exciter circuit of the dynamo-electric machine said controlled by the voltage regulator, a heat-sensitive member heated by said resistance, and means

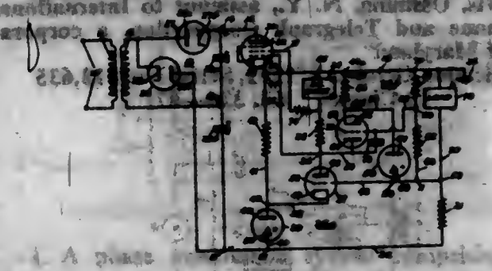
to control the voltage regulator from said heat-sensitive member.

---

2,774,930
THREE-PHASE LOW FREQUENCY GENERATOR
Donald E. Abell, Buffalo, N. Y., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 10, 1955, Serial No. 507,193
11 Claims. (Cl. 322—61)

1. In an electric system of control, in combination, a first generator having a self-energizing field winding connected across its armature terminals, a second and a third generator each having self-energizing field windings connected in series to the opposite armature terminals of the second and third generators, the first generator having a differential field winding connected to the opposite armature terminals of the second and third generators, and the second and third generators each having a control field winding, said control field windings being connected in series across the armature terminals of the first generator, whereby each of the generators will have alternating current output with the output of one generator having a definite phase lag with respect to the other generators, said generators being connected in a T network to produce a typical three-phase output at the outer terminals of the T network.

---



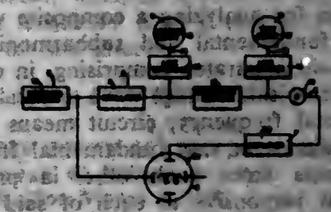
2,774,931
MEANS FOR VOLTAGE REGULATION BY AID OF AN EXCITER
Uno Lamm, Ludvika, Sweden, assignor to Allmänna Svenska Elektriska Aktiebolaget, Vesterås, Sweden, a corporation of Sweden
Application June 21, 1954, Serial No. 438,178
Claims priority, application Sweden June 22, 1953
6 Claims. (Cl. 322—79)

1. Means for controlling the magnetization of a main machine, comprising an exciter provided with two excitation windings one of which is connected as a shunt winding to the brushes of said exciter, uni-directional valve means series connected with said shunt winding, and a regulator for controlling the excitation of said exciter, said regulator and the second excitation winding being connected in series with said valve means.

2,774,932
ELECTRICAL REGULATING CIRCUITS
Ben Hale Bartlett, Lexington, Mass., assignor to Raytheon Manufacturing Company, Newton, Mass., a corporation of Delaware
Application June 23, 1953, Serial No. 363,515
6 Claims. (Cl. 323—22)

1. An electrical system comprising a source of energy, a grid-controlled regulating tube, a load device, and means responsive to the load energy for applying to the grid of the regulating tube a control potential; said means comprising two load-shunting circuits, each having a control tube whose plate current determines said grid potential, said plate current of the control tube of one of said circuits varying in response to changes in load impedance current; the control tube of said one circuit being conductive in a selected operating range and tending to maintain a constant current in the load; the plate current of the control tube of the other of said circuits varying in response to changes in load impedance voltage drop, the control tube of said other circuit being conductive only when the load impedance voltage drop rises above a predetermined level and, when conductive, tending to maintain a constant voltage across the load.

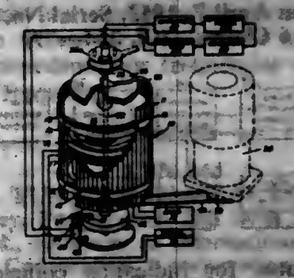
---



2,774,933
FIRING POINT INDICATOR FOR INTERNAL COMBUSTION ENGINES
Harold O. Penn, Golden, Colo.
Application November 21, 1952, Serial No. 321,798
2 Claims. (Cl. 324—16)

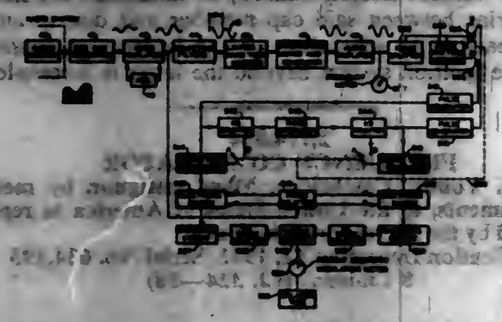
1. A firing point indicator coactable with the interrupter case of an internal combustion engine high tension ignition system in substitution for the distributor cap of such system, comprising a cap member formed with a closed base adapted to register with and close over the interrupter case, means detachably intercoupling said cap member and interrupter case in a fixed condition of predetermined angular relation, an integral boss formed with an axial bore upstanding centrally from the closed base of said cap member, a rotatable stem axially through said bore, an ear on and projecting radially from the stem end within the cap member for engagement within a notch conventionally characterizing the driven shaft of the ignition system, an opaque disc concentrically and perpendicularly fixed to the stem portion exterior of the cap member, a single opening intersecting said disc eccentrically of the stem, a separate, opaque housing shrouding said disc and closing against said cap member with the housing base adjacently covering the disc, means separably intercoupling said housing and cap member in a fixed condition of predetermined angular relation, a series of angularly-spaced like openings intersecting the housing base for successive registration with the disc opening in a disposition about said stem sensitive of distributor cap contacts, an electric bulb carried by said cap member within said housing and beneath said disc, and a circuit serving said bulb on shunt relation with the interrupter contact circuit, whereby to illuminate the housing interior between said cap member and disc in automatic reaction to separation of the interrupter contacts when the ignition system beyond the latter is incomplete.

---



2,774,934
FREQUENCY COMPARATOR
Louis B. Young, Cambridge, Mass., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application December 11, 1945, Serial No. 634,293
8 Claims. (Cl. 324—58)

1. A frequency comparator for calibrating an unknown cavity resonator comprising, means for generating a sawtooth voltage, an oscillator which is frequency modulated by said sawtooth voltage, a reference cavity resonator, a decoupling network, a first and a second phasing network, said first phasing network connecting said reference cavity to the output of said oscillator, a detector connected through said decoupling network to the output of said oscillator, means for connecting said unknown cavity resonator through said second phasing network to the junction of said detector and said decoupling network, and a cathode ray indicator, means applying said sawtooth voltage as the sweep deflection voltage for said cathode ray beam, and means applying said detector output to said indicator as transverse or signal deflection.



---

2,774,935
MAGNETOSTRICTIVE FREQUENCY ANALYSERS
Martin E. Richmond, Nahant, N. H., and Daniel Blitz, Boston, Mass., assignors to Raytheon Manufacturing Company, Newton, Mass., a corporation of Delaware
Application January 7, 1954, Serial No. 402,676
18 Claims. (Cl. 324—77)

1. In a magnetostrictive frequency analyser, a plurality of rods of magnetostrictive material, each resonant at a discrete narrow band of frequencies, means to excite said rods with the signal to be frequency analysed, means to mount said rods with one end of each in a common plane, means to sense the amplitude of the axial magnetostrictive displacement in each rod successively and indicator means under control of the output of said sensing means.

2,774,836
COMPLEX WAVE ANALYZER
Frank C. Dunlington, New Brunswick, N. J., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application May 6, 1946, Serial No. 667,383
9 Claims. (Cl. 324—77)

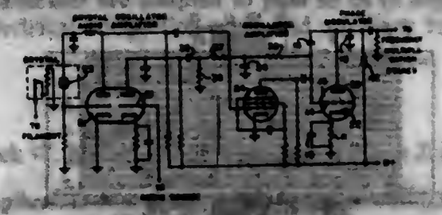
1. Apparatus for analyzing a composite voltage wave containing a fundamental and subharmonic frequency components, said apparatus comprising, in combination, means for filtering said voltage wave to obtain a signal at said fundamental frequency, circuit means arranged to produce two signals at said fundamental frequency but shifted in phase from each other a predetermined amount, means responsive to each of said two signals for generating a pair of square wave voltage signals having half-periods equal to the period of said fundamental frequency and displaced in time from each other the aforesaid predetermined amount, a pair of electronic switches, means for applying said composite voltage wave to said electronic switches in opposite phase, means applying said square wave voltage signals to corresponding ones of said electronic switches whereby equal portions of said oppositely phased composite voltage waves are sequentially passed by said switches, means for averaging the outputs of each of said electronic switches to produce a pair of voltage indicative of the relative amplitude of said harmonic frequency component, and an indicator arranged to provide an indication of the larger of the last-mentioned pair of voltages, said indicator being proportional to the relative amplitude of the subharmonic frequency component in said composite voltage wave independently of phase variation between said fundamental and said subharmonic frequency components.

2,774,837
FREQUENCY COINCIDENCE INDICATOR
Paul G. Bilinski, Greenvale, N. Y., assignor to the United States of America as represented by the Secretary of the Army
Application April 7, 1953, Serial No. 347,245
6 Claims. (Cl. 324—79)

1. An apparatus for indicating coincidence in frequency between first and second signals, comprising: means for generating a modulating signal; a carrier-suppressing modulator; means for applying said first signal and said modulating signal to said modulator, whereby the output thereof contains the sum and difference frequencies of said first signal and modulating signal; means for heterodyning said second signal and the output of said modulator to derive a beat frequency signal having a frequency twice that of said modulating signal and having a minimum amplitude when said first and second signals coincide in frequency; and frequency selective means coupled to said heterodyning means, said frequency selective means being tuned to said beat frequency.

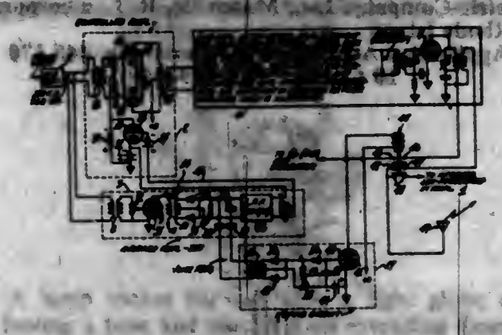
2,774,838
PHASE DISCRIMINATOR
Gus Stavis, Onondaga, N. Y., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland
Application October 8, 1952, Serial No. 313,635
12 Claims. (Cl. 324—87)

1. A network for measuring the phase difference between two signal voltages, comprising two loop circuits each including at least a directional element and a load resistor, means for producing two relatively high level voltages having magnitudes proportional to and greater than said signal voltages, means for producing in the first of said loops a resultant voltage equal to the difference between said high level signals plus one of said signal voltages, and means for producing in the second of said loops a resultant voltage between said high level voltages minus one of said signal voltages whereby the D.-C. voltage measured across said load resistors is proportional to the difference in phase between said signal voltages.



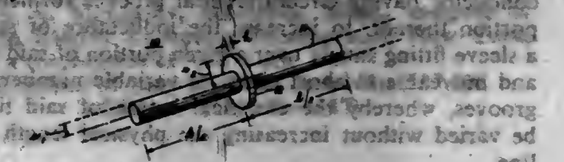
2,774,839
METHOD OF VARYING THE OUTPUT FREQUENCY OF MAGNETRON OSCILLATORS
Philip H. Peters, Jr., Schenectady, and Donald A. Wilbur, Albany, N. Y., assignors to General Electric Company, a corporation of New York
Application June 22, 1950, Serial No. 169,712
3 Claims. (Cl. 332—5)

1. The method of voltage tuning a traveling wave magnetron including a cathode electrode providing an electron space charge, an axially extending segmented anode electrode structure, an output circuit coupled to said anode structure to establish a high frequency field between said segments when excited with high frequency energy, and means providing an axially extending magnetic field between the anode and cathode electrodes, which method comprises applying direct current potential between said anode and cathode, limiting the cathode electron emission and heavily loading the output circuit so that over a given range of anode-cathode potential the rate of change of the restraining force due to the high frequency electric field between said segments with respect to a change of anode-cathode potential is substantially less than the rate of change of impelling forces moving the space charge through said high frequency electric field with respect to the anode-cathode potential, and varying said anode-cathode potential within said range to vary the operating frequency of said magnetron.



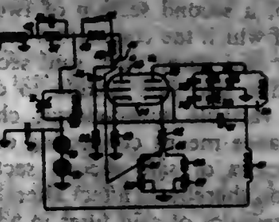
2,774,840
PHASE MODULATION SYSTEMS
Allen A. Macdonald, New Brunswick, N. J., assignor to the United States of America as represented by the Secretary of the Army
Application August 20, 1953, Serial No. 377,269
4 Claims. (Cl. 332—16)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A phase modulation system comprising a carrier frequency wave source of constant frequency and constant current, a source of modulating signal, an electron discharge device having a cathode, anode and control electrode, the transconductance of said electron discharge device being a function of the potential difference existing between said control electrode and cathode, means applying said carrier frequency wave and said modulating signal between said control electrode and cathode, a capacitance having a given reactance at said carrier frequency coupling said control electrode to said anode, said given reactance being appreciably smaller than the plate resistance of said electron discharge device, and a load having a total impedance substantially equal to said given reactance connected between said anode and cathode, whereby a phase modulated output is obtained across said load.



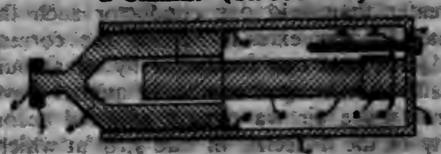
2,774,841
CONTROLLED SINGLE-SIDEBAND TRANSMITTER
James L. Finch, East Rockaway, and Leonard R. Kahn, New York, N. Y., assignors to Radio Corporation of America, a corporation of Delaware
Application August 31, 1953, Serial No. 377,364
17 Claims. (Cl. 332—37)

4. In a single sideband transmitter, a single sideband generator to which a band of modulation frequencies is supplied, a single sideband amplifier, a coupling between the input of said amplifier and the output of said generator, a controllable-gain amplifier in said coupling, and means responsive to modulation frequencies of a predetermined range on the single sideband output of said generator for controlling the gain of said controllable-gain amplifier.



2,774,842
ELECTROMECHANICAL WAVE FILTER
Warren P. Mason, West Orange, and Herbert J. McSkimin, Basking Ridge, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application April 29, 1953, Serial No. 351,842
7 Claims. (Cl. 333—71)

1. A mechanical wave filter for transmitting a band of frequencies, said filter having a lower cut-off frequency $f_L$, and an upper cut-off frequency $f_U$, comprising a small-diameter cylindrical rod of acoustic material of radius $r_1$ having a length $l$ that is approximately a half wavelength long in the torsional mode of vibration at a frequency within said band, and an annular disk of acoustic material of distributed mass having an inner radius $r_1$, an outer radius $r_2$, and a thickness $h$ that is



less than one-half wavelength in the torsional mode of vibration at a frequency within said band connected to said rod and dimensioned to resonate in a single torsional mode at a frequency $f_r$ when said rod is torsionally excited by mechanical vibrations applied to an end thereof, whereby a peak of attenuation is provided at a frequency $f_r$ at a desired point outside the pass band of said filter.

2,774,843
FREQUENCY SELECTIVE APPARATUS
Oswald G. Villard, Jr., Palo Alto, Calif.
Application March 3, 1953, Serial No. 339,985
3 Claims. (Cl. 333—80)

3. A frequency selective apparatus for application to electrical networks having a conductor lead to which radio frequency voltages are applied comprising a first vacuum tube having plate, cathode and control grid elements, a tuned regenerative amplifier including a tube having plate, cathode and control grid elements and a tuned circuit regeneratively connected thereto, means for connecting said tuned regenerative amplifier to said first tube to provide negative feedback to the same, a conductive path connected between said conductor and a point of neutral potential, selective means for selectively connecting said first tube or said regenerative amplifier in said conductive path, whereby when said regenerative amplifier is connected in said path positive feedback is applied to said conductor to give an exalted radio frequency voltage and when said first tube is connected in said path there is a negligible impedance at the selected frequency to which the amplifier is tuned and a relatively high impedance for frequencies above and below the selected frequency.

2,774,844
TUNABLE COAXIAL LINE
John O. Sliwez, Fort Wayne, and Orrin C. Beeber, Huntington, Ind., assignors to International Telephone and Telegraph Corporation, a corporation of Maryland
Application August 9, 1952, Serial No. 303,496
2 Claims. (Cl. 333—82)

1. A tunable coaxial line comprising, an outer conductor, an inner conductor concentric therewith and

spaced therefrom, means for short-circuiting said line at one end thereof, a movable conductive cap positioned at the opposite end of said line over a portion of said inner conductor and contacting said outer conductor, whereby the capacity between said conductors may be varied by moving said cap over said inner conductor, said inner conductor having circumferential grooves formed over a portion thereof, to increase the inductance of said line, a sleeve fitting snugly over a given portion of said grooves and moveable to short circuit a variable number of said grooves, whereby the electrical length of said line may be varied without increasing the physical length of said line.

---

**2,774,045**
**ULTRA-HIGH-FREQUENCY TUNER**
James F. Wilcox, Syracuse, N. Y., assignor to General Electric Company, a corporation of New York
Application October 17, 1951, Serial No. 251,675
5 Claims. (Cl. 333—82)

1. An ultra-high-frequency filter circuit comprising a first section of two-conductor transmission line having a parallel conductor part and a flared conductor part connected thereto, a second section of two-conductor transmission line of which the conductors are conformably disposed relative said flared part, said second section being movable relative said first section to define therewith a filter having variable tuned-circuit characteristics, and variable reactance means connecting corresponding ends of the conductors of said second section remote from said first section thereby to affect alterations in the tuned-circuit characteristics of said filter in accordance with the value of the reactance of said variable reactance means.

---

**2,774,046**
**MICROWAVE TRANSMISSION LINE**
Maurice Arditi, Clifton, N. J., and Philip Parzen, Forest Hills, N. Y., assignors to International Telephone and Telegraph Corporation, a corporation of Maryland
Application May 5, 1952, Serial No. 286,764
14 Claims. (Cl. 333—84)

6. A transmission line for propagation of radio frequency wave energy in a mode simulating substantially the TEM mode, comprising a pair of conductors, a strip of dielectric material separating said conductors in closely spaced substantially parallel relation, the mutually opposed surfaces of said conductors having a lateral extent corresponding substantially to the width of at least one of said conductors and said dielectric strip being of a width greater than said one conductor such that each of its lateral edges extends beyond the corresponding lateral edge of said one conductor by an amount equal substantially to an integral number of quarter wavelengths of the free space air wavelength adjusted according to the quality of the dielectric of said strip at which excitation of wave modes through or over the surface of the dielectric is substantially, plus an integral number, including zero, of such adjusted wavelengths divided by two.

**2,774,047**
**COIL CLAMPING DEVICE FOR A TRANSFORMER**
Harding B. Hansel, Elm Grove, Clair E. Gunderson, Milwaukee, and William C. Dailey, Wauwatosa, and Karl P. Wiedenbeck, Elm Grove, Wis., assignors to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Application October 4, 1954, Serial No. 459,594
5 Claims. (Cl. 336—207)

5. An externally operable device for clamping a plurality of disk coils and insulation within an enclosing tank of a transformer in which the magnetic core forms an integral part of said tank, said device comprising a rigid plate disposed parallel to the plane of said coils intermediate said assembly and a wall portion of said tank, a plurality of guide sleeves fixedly attached to said plate in predetermined spaced relationship, each of said sleeves disposed with its axis normal to the face of said plate, means associated with said wall portion for receiving said sleeves to position said plate with respect to said assembly, and individual jack bolts associated with different ones of said sleeves, each of said bolts extending in threaded engagement through a wall portion of said tank with the ends of said bolts disposed in their associated sleeves whereby said plate is moved against said assembly by a turning action of said bolts.

**2,774,048**
**PORTABLE ELECTRIC HAND LAMP HAVING RECEPTACLE TO RECEIVE ATTACHMENT PLUGS**
Leonard N. Bannister, Pawtucket, R. I., assignor to Royal Electric Company, Inc., Manville, R. I., a corporation of Rhode Island
Application August 6, 1954, Serial No. 448,170
10 Claims. (Cl. 339—99)

1. In combination, a socket for an electric light, a handle for said socket, said handle being formed of insulating material and having a first recess open at the top thereof in which said socket is substantially snugly received, said socket having first terminals forming a part thereof and located in said first recess, a passage through said handle from a point adjacent the bottom thereof through which a wire is adapted to pass up to and be electrically connected to said first terminals, female auxiliary terminals of self-sustaining material projecting an arm physically affixed to a corresponding first terminal and depending therefrom and a pair of overlying leaves secured to said arm, extending below said socket, and resiliently urged toward one another so as to define between themselves a space adapted to snugly receive a male

connector, said handle having a second recess below and communicating with said first recess to receive said auxiliary terminals are at least partially snugly received, said second recess including a bottom wall on which said auxiliary terminals rest, thereby fixing the position of said socket and said auxiliary terminals within said handle, said handle having apertures therethrough through which male connectors are adapted to pass so as to engage and make electrical connection with said auxiliary terminals.

---

**2,774,049**
**BULB PROTECTOR**
Frederick W. Kibler, Beechhurst, and William J. McNiff, Wantagh, N. Y.
Application March 25, 1952, Serial No. 278,371
2 Claims. (Cl. 339—78)

1. The combination with a conical bulb mounted in a substantially conical socket, the base of the socket being contiguous to the base of the bulb, of a protective device to prevent separation of the bulb from the socket, said device comprising a loop surrounding the bulb at an area intermediate its apex and base portion, at least one arm extending from the loop along the bulb and down to the socket, strap means extending from the arm adapted to surround the socket, and means locking the strap means to the conical socket intermediate its apex and base portions to prevent separation of the bulb from the socket.

---

**2,774,050**
**SOCKET FOR STUDIO LAMP OR THE LIKE**
Ralph L. Logan, Los Angeles, Calif., assignor to J. G. McAllister, Inc., Hollywood, Calif., a corporation of California
Application December 20, 1954, Serial No. 476,436
10 Claims. (Cl. 339—75)

1. A lamp socket for use with a light globe of the type having a base and spaced posts extending therefrom, comprising, a hollow body portion, a mass of insulating material within said body portion and including a plurality of parallel bores having a spacing substantially equal to the spacing between the light globe posts, a split socket element within each of said bores for receiving the light globe posts, the transverse dimensions of said socket elements being somewhat less than those of the bores whereby to permit limited lateral movement of the socket elements in the bores; and means for forcing the split portions of the socket elements together whereby to clamp said posts therebetween, comprising an actuating rod movably mounted in the housing, a clamp bar including extensions movable in bores in the housing, spacer elements movable in bores formed in said insulating material in alignment with the second mentioned bores and opening into said first mentioned bores, said spacer elements being engageable with said extensions and with said socket elements, a spring operatively connecting said rod and bar whereby movement of the rod in one direction will cause said spacer elements to be resiliently urged against the socket elements to force the split portions of the latter together, and manually operable means for moving the rod.

---

**2,774,051**
**ELECTRICAL UNIT**
Lawrence A. MacCurdy, Haverhill, Mass., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application February 16, 1953, Serial No. 337,031
2 Claims. (Cl. 339—147)

1. An electrical unit comprising a dielectric base having pairs of spaced apertures therein, pairs of like terminals extending through the apertures of the base and fixed to the base intermediate their ends, a hollow electric device having leads exposed disposed on selected ones of the terminals of each pair, and resilient clamping elements adapted to be mounted readily on like ends of the terminals to secure the electric devices and like leads thereof to the selected terminals simultaneously and to secure the other leads to the remaining respective terminals.

---

**2,774,052**
**MECHANICAL ASSEMBLY OF ELECTRONIC CIRCUIT COMPONENTS**
William Fleur, Chicago, Ill., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Application April 6, 1951, Serial No. 219,652
6 Claims. (Cl. 339—176)

6. A mechanical assembly of electronic apparatus comprising, in combination, a plurality of complementary support bodies fashioned for separable engagement along at least one general plane, said bodies being shaped to define when placed together a first series of parallel bores spaced apart in two directions parallel to said plane and having axes generally perpendicular to said plane and a second series of outwardly open bores generally parallel to said plane, each of said bores of said second series connecting with one of said bores of said first series in generally perpendicular relation to the latter, a plurality of terminal leads disposed in said respective bores of said second series, a plurality of electrical elements removably disposed in said respective bores of said first series and having electrical contacts on opposite ends thereof, said elements in said bores of said first series connecting with bores of said second series making contact with said terminal leads in the latter, means on said bodies forming a pair of two-dimension patterns of circuitry located respectively in two planes disposed at opposite ends of said bores of said first series in generally perpendicular relation to said axes thereof, and means for applying forces to said circuitry patterns in directions parallel to

said sets of said bores of said first series to hold said respective circuitry patterns firmly in engagement with adjacent contacts of said electrical elements.

---

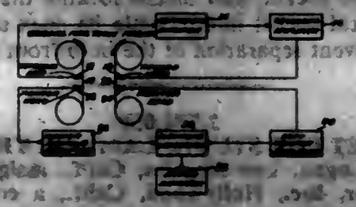
2,774,943
FLEXIBLE TERMINAL STRIP
Boyd R. Boger, Dayton, Ohio, assignor to the United States of America as represented by the Secretary of the Air Force
Application January 14, 1954, Serial No. 404,151
1 Claim. (Cl. 339—256)
(Granted under Title 35, U. S. Code (1952), sec. 266)

A terminal strip adapted to adhere to devices having an irregular contour and which are subject to strong centrifugal forces comprising a substantially rectangular flexible nonconductive support member, a plurality of elongated conductive terminal members positioned transversely of the longitudinal axis of the support member, and arranged in parallel longitudinally spaced relation, said support member comprising a single continuous base surface and an upper portion, said base surface adapted to completely coincide with, and frictionally grip, a work surface of irregular contour on a rotating device, said upper portion having an elongated recessed upper surface centrally positioned between the sides of the support, said recessed upper surface extending parallel to the longitudinal axis of the support member and adapted to receive a clamping strap, said support member having bevelled outwardly extending side surfaces intersecting the base surface to provide increased frictional area for holding the support in position against the strong centrifugal forces.

---

2,774,954
BATTERY TERMINAL CONNECTOR
William G. Tunney, Chicago, Ill.
Application May 8, 1953, Serial No. 356,146
2 Claims. (Cl. 339—233)

1. A battery terminal connector comprising: a U-bolt having parallel arms adapted to embrace a battery terminal post; a clamping member including a clamp bar having apertures adjacent its ends to receive the end portions of the U-bolt arms and an integral neck which extends outwardly from a transversely extending margin of said bar parallel to said arms, said neck being narrower than the space between the arms; and having laterally flared ears at its outer end provided with holes, said ears being wider than the space between said arms; fastening means for a battery cable including a laterally extending pressure plate which has ears substantially coextensive with those on the neck, and means for clamping the uninsulated end portion of a battery cable in a longitudinally extending position between the pressure plate and said neck with the ears on the pressure plate opposite the ends of the U-bolt arms; and nuts fastening said clamping member to the U-bolt, the length of said arms from a perpendicular plane tangent to the battery terminal post plus the thickness of said nuts being greater than the thickness of said clamp bar plus the length of said neck to said ears.



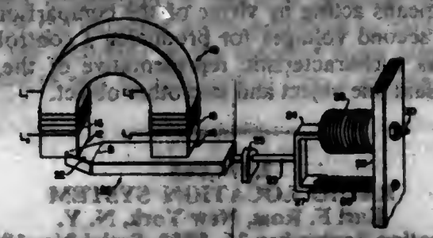
2,774,955
ELECTRIC CONNECTOR MEMBER WITH MARGINAL SLITS
Hugh W. Batcheller, Newton, Mass., assignor to Kent Mfg. Corp., Newton, Mass., a corporation of Massachusetts
Application March 31, 1953, Serial No. 345,991
4 Claims. (Cl. 339—258)

1. An electric connector member comprising a piece of sheet metal stock bent to form a shallow channel having a floor, side walls extending up from the side edges of the floor and plane inturned flanges along the top edges of the walls, said member having a slit therethrough at the junction of each said side wall with said floor, each said slit terminating short of the ends of the corresponding side wall, said floor having a transverse ridge above the level of the ends of the floor, from which the forward portion of the floor slopes gradually downward to the forward end.

---

2,774,956
COMPARATOR DEVICE
Jerome W. Stafford, Hollywood, and Kenneth M. Frierson, Los Angeles, Calif., assignors to Loew's Incorporated, Culver City, Calif., a corporation of Delaware
Application April 12, 1954, Serial No. 422,472
4 Claims. (Cl. 340—149)

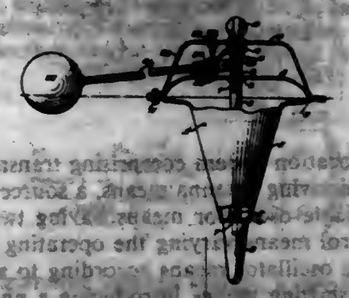
1. In combination, a first medium on which signals have been recorded, a second recording medium, means to record signals on said second medium from said first medium, means to read signals on said first medium which have been recorded on said second medium, means to read signals on said second medium which correspond to the signals being read on said first medium, a pair of rectifiers each of which is coupled to a different one of said means to read signals, a pair of integrating networks each having an input and an output, the input of each of said integrating networks being coupled to a different one of said rectifiers, means coupling the outputs of said integrating networks to oppose each other, a pair of tubes each having an anode control grid and cathode electrode, means coupling the output from each integrating network to a different one of said control grids, a pair of anode load resistors each of which is connected to a different one of said anodes, and a relay having its coil connected between the anodes of said tubes.



---

2,774,957
MAGNETIC MODULATOR
William A. Jones, Newtonville, Mass., assignor, by mesne assignments, to Detroit Controls Corporation, Detroit, Mich., a corporation of Michigan
Application October 29, 1952, Serial No. 317,699
5 Claims. (Cl. 340—196)

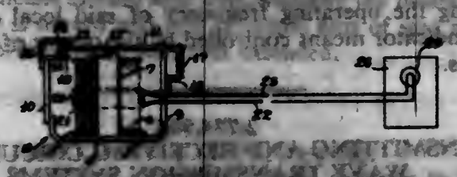
1. A magnetic modulator comprising a magnetic circuit, means for impressing a signal on said circuit, means for varying the reluctance of said circuit, said last-mentioned means including a stationary core member having a plurality of pole faces and a movable core member to a fixed distance from said stationary core member, said



movable core member having at least a portion thereof profiled in accordance with a predetermined non-linear mathematical function, means for displacing said movable core member in a path at said fixed distance from said stationary core member to vary the projected area of said profiled portion of said movable core member on one of

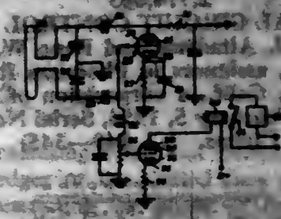
said plurality of pole faces, an external source for actuating said displacing means, and means for deriving from said magnetic circuit an output signal corresponding to said input signal but modulated in accordance with the position of said movable core member relative to said stationary core member and with said predetermined mathematical function.

---



2,774,958
WARNING DEVICE FOR SWIMMING POOLS
Theodore T. Reichel, Los Angeles, Calif.
Application April 22, 1954, Serial No. 424,876
7 Claims. (Cl. 340—213)

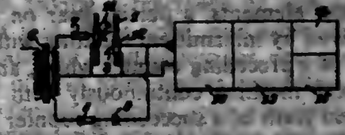
1. A warning device for swimming pools, comprising: a buoy structure having an unsubmerged upper end and a depending weighted end, said buoy structure tending to float relatively undisturbed on a body of water; a buoyant float relatively susceptible to surface disturbances on said body of water; an arm pivotally connecting the unsubmerged end of said buoy and float; contact means operable on relative movement of said float and buoy; and an alarm means operatively associated with said contact means.



---

2,774,959
PILOT LIGHT FOR ELECTRICAL DEVICE
John E. Watkins, Maywood, Ill.
Application September 2, 1954, Serial No. 454,747
1 Claim. (Cl. 340—252)

A shortening system for an electrical device having an alternating current operated coil comprising, in combination, a low voltage electric lamp located at a point remote from the device, an insulated conductor having a plurality of turns wound around the middle of the coil, and conductive leads connecting the ends of said conductor with the terminals of said lamp.



2,774,960
DETECTING MEANS FOR STOLEN GOODS
Thomas F. Thompson, Eugene, Oreg., assignor of three-eighths to Richard B. Thompson, Eugene, and one-fifth to Dale Rolland and one-fifth to Oliver D. Olson, Portland, Oreg.
Application June 15, 1953, Serial No. 361,575
9 Claims. (Cl. 340—258)

3. Apparatus for actuating an electric circuit for detecting stolen merchandise, said apparatus comprising an oscillator reactive to a single tuned resonant circuit to change the potential of said oscillator, means forming a resonant circuit tuned to the frequency of the oscillator, the resonant circuit being removably mounted on the merchandise, the oscillator being positioned so that the merchandise must pass through the oscillator field, and means connecting the oscillator to the electric circuit for actuating the latter when the merchandise carrying the resonant circuit is placed within the field of the oscillator, whereby to indicate the presence of the resonant circuit on the merchandise being stolen.

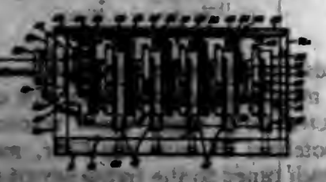
---

2,774,961
TEXTILE THREAD BREAKAGE OR SLUBBING DETECTOR SYSTEM
Ernst Brunsing, Cardingen, Krein Leutkirch, Germany
Application July 6, 1953, Serial No. 361,952
10 Claims. (Cl. 340—259)

1. Apparatus for the supervision of production processes for material of low electrical conductivities such as textiles which comprises an ungrounded measuring electrode, an ungrounded voltage carrying electrode positioned in spaced relationship to said measuring electrode, said electrodes being positioned to be bridged for contact with material of low electric conductivity passing a predetermined area in a production process, means for supplying sufficient voltage to said voltage carrying electrode to allow current to pass through material of low conductivity such as textiles from the voltage carrying electrode to the measuring electrode when both electrodes are contacted by a piece of such material.

---

2,774,962
ACCELEROMETER
Tung H. Liu, Detroit, Mich.
Application February 6, 1953, Serial No. 335,182
4 Claims. (Cl. 340—261)



1. An accelerometer comprising a movable magnetic mass, an electromagnetic circuit including a stationary

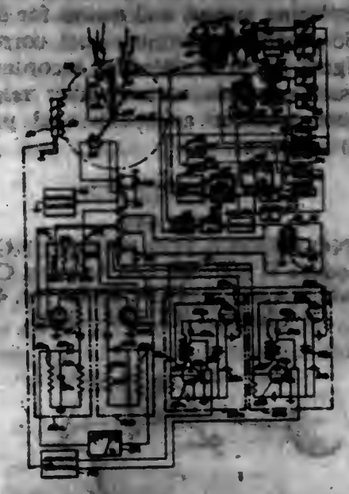
electromagnet imposing an electromagnetic force on the mass for holding the mass subject to an inertia force greater than the electromagnetic force, and an indicating circuit including a part of the magnetic circuit adapted to be opened and closed by the movable mass.

---

2,774,063
SEQUENTIAL CIRCUIT CONTROL DEVICE
Carl E. Grimstead, Altadena, and Rene W. Prichard, La Canada, Calif., assignors to Photocon Research Products, Pasadena, Calif., a corporation of California
Application February 5, 1954, Serial No. 408,436
8 Claims. (Cl. 340—345)

1. A sequential circuit control device comprising a base plate, a plurality of individual counter elements, a support for each counter element affixed to the base plate, a counter wheel in each counter element having peripheral counter wheel gear teeth and adapted to be rotated by external actuation, each counter wheel having a counting radix, a full revolution of the counter wheel resulting from a number of unit actuations equal to the counting radix, each unit actuation causing a rotation of the counter wheel through an angle of 360° divided by the counting radix, an indexing gear concentric with and rotated by the counter wheel, indexing gear teeth on only a portion of the indexing gear, preceding and succeeding counter elements being mechanically interconnected through their counter wheels by gearing means each of which gearing means comprises a counter drive shaft between adjacent counter elements, a partial gear on the counter drive shaft driven by intermittent meshing with the indexing gear teeth of a preceding counter wheel, and a counter wheel drive gear meshing continuously with the counter wheel drive gear teeth of a succeeding counter wheel, each of said gearing means connecting only one pair of counter elements, and being mounted independently of any other similar gearing means, whereby a preceding counter wheel, on substantially completing one full revolution causes the indexing gear teeth to mesh with the partial gear to turn the counter drive shaft to actuate the counter wheel of a succeeding counter element by one unit of the succeeding counter wheel's counting radix when the preceding counter wheel has completed one full revolution, a wiper arm and a contact unit for each counter wheel, the contact unit being fixed with respect to each counter element, and the wiper arm being rotated by the counter wheel and making a sliding contact with the contact unit, whereby an electrical circuit may be completed from each wiper arm to the contact unit.

---



2,774,064
OVERTAKE WARNING AND WAVE-OFF
William T. O'Neil, La Crescenta, Calif., assignor to Gilfillan Bros., Inc., Los Angeles, Calif., a corporation of California
Application December 24, 1951, Serial No. 263,079
13 Claims. (Cl. 343—7)

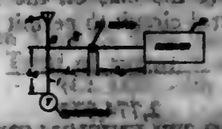
10. In a system of the character described: means for producing and scanning an antenna beam through space and deriving resulting echo video signals, one from each of a corresponding plurality of objects in said space, range tracking means sensitive to said video signals for developing a plurality of voltages each representative of the range of corresponding ones of said objects, and means for comparing a first voltage due to one of said objects with a second voltage due to another one of said objects, means acting by virtue of the comparison of said first and second voltages for producing a control voltage which has a characteristic representative of the spacing between said one object and said other object.

---

2,774,065
RADIO LOCATION SYSTEM
Karl F. Ross, New York, N. Y.
Application September 26, 1950, Serial No. 186,694
13 Claims. (Cl. 343—9)

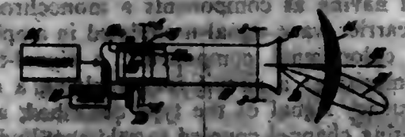
1. A radio location system comprising transmitting antenna means, receiving antenna means, a source of carrier frequency, variable oscillator means having two outputs, frequency control means varying the operating frequency of said variable oscillator means according to a sawtooth pattern, phase shifting means introducing a phase difference between the sawtooth patterns of said two outputs, first modulator means combining carrier energy from said source with one of the outputs of said variable oscillator means and applying at least one resulting sideband to said transmitting antenna means, a local oscillator, second modulator means combining carrier energy from said source with the other of the outputs of said variable oscillator means and producing a sideband corresponding, as to its location with respect to the associated carrier, to the sideband applied to said transmitting antenna means by said first modulator means, said second modulator means modulating oscillations from said local oscillator with said corresponding sideband, third modulator means combining the output of said receiving antenna means with that of said second modulator means, narrow-band pass filter means connected to the output of said third modulator means, the pass band of said filter means including the operating frequency of said local oscillator, and indicator means controlled by the output of said filter means.

---



2,774,066
TRANSMITTING AND RECEIVING CIRCUITS FOR WAVE TRANSMISSION SYSTEMS
Arthur L. Samuel, Summit, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application January 30, 1948, Serial No. 4,174,123
16 Claims. (Cl. 343—12)

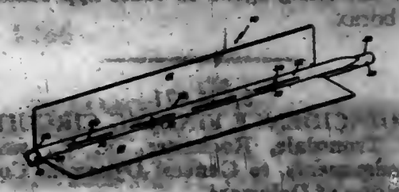
1. A terminal circuit for a two-way signal transmission medium in a two-way signal transmission system, comprising an alternating signal wave generator, a signal re-



ceiver, common transmission means for transmitting the waves produced by said generator to said medium and for receiving incoming alternating signal waves from said medium, a coaxial line connecting said generator to said common transmission means, a branch coaxial line connecting said receiver to the first coaxial line by a series branching connection, a chamber resonant to the frequency of the outgoing waves produced by said generator and of the incoming waves received from said medium, connected in said branch coaxial line, a gas discharge device connected across said resonant chamber, adapted to discharge in response to the resonant voltage applied to the chamber by the outgoing signal waves from said generator to effectively short-circuit said chamber and thus the input to said receiver during signal transmitting periods, and to remain in the undischarged condition in response to the relatively lower resonance voltage applied to the chamber by the incoming signal waves from said medium, to allow transmission of said incoming waves to said receiver with minimum attenuation during signal receiving periods.

---

2,774,067
MICROWAVE SCANNING ANTENNA SYSTEM
Walden P. Bollinger, Haddonfield, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application August 17, 1949, Serial No. 110,782
7 Claims. (Cl. 343—762)



1. In a scanning antenna system, a circular hollow pipe waveguide having a throat portion and having an open mouth portion for radiation or reception of electromagnetic energy, said portions having a longitudinal axis and having transverse dimensions to propagate at an operating frequency a first mode having components of odd symmetry with respect to a plane passing through and containing said axis and to propagate energy at said frequency in a second mode having components of even symmetry with respect to said plane, means comprising a section of said waveguide between said throat and said mouth portions to couple such energy in each of said modes in said mouth portion to such energy in one only and not the other mode in said throat portion with said coupled energy in said two modes in the mouth portion being co-phasal at the mouth thereby to direct the principal axis of the directive energy pattern of said mouth portion to one side of said plane, and means to move said coupling means around said axis, whereby the position of said plane is moved and said principal axis of said radiation is moved around said axis extended.

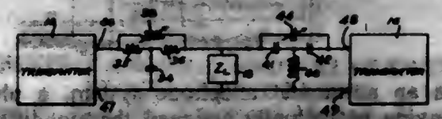
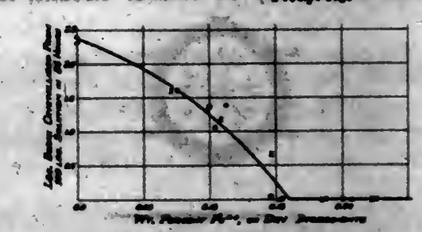
2,774,068
DIATHERMY APPLICATORS
Dana B. Hauptman, Wayland, Mass., assignor to Raytheon Manufacturing Company, Newton, Mass., a corporation of Delaware
Application February 16, 1953, Serial No. 336,981
5 Claims. (Cl. 343—770)



1. A microwave antenna comprising a coaxial line having a circular inner conductor and a rectangular outer conductor, one face of said outer conductor containing a single array of slots resonant at the operating frequency and spaced longitudinally along said line, means for supporting said inner conductor in fixed spatial relationship with respect to said outer conductor means included within said means for supporting for coupling energy from said

line to said radiating slots, and reflector means attached to opposite edges of the slotted face of said outer conductor for restricting the angle of radiation from said antenna.

---

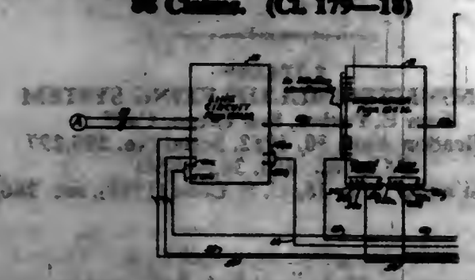


2,774,069
TRANSMITTER MULTIPLEXING SYSTEM
Sam E. Parker, San Diego, Calif.
Application April 30, 1952, Serial No. 285,297
5 Claims. (Cl. 343—203)
(Granted under Title 35, U. S. Code (1952), sec. 266)

3. In a transmission system, a plurality of radio frequency circuits operating at different frequencies, a common load termination for said circuits, filter means for transmitting between said load and each circuit the frequencies of the associated circuit and for suppressing the frequencies of at least one other circuit, said filter means comprising a bridged-T network including a pair of series arms having like reactance of predetermined sign, and a shunt arm having a reactance of sign opposite to the reactance of said series arms, said network including adjustable means for controlling the optimum suppression frequencies of said filter means regardless of the terminating impedances thereof, said adjustable means comprising an impedance arm bridging said series arms and having a reactance of said predetermined sign.

---

2,774,070
STABILIZATION OF BORAX SUPERSATURATION IN SOLUTIONS
Donald S. Taylor, Long Beach, and George A. Connell, Los Angeles, Calif., assignors, by mesne assignments, to United States Borax & Chemical Corporation
Application April 10, 1953, Serial No. 347,892
5 Claims. (Cl. 23—89)



1. The method of stabilizing a state of supersaturation with respect to borax in aqueous solution during a holding period of appreciable duration; said method comprising producing an aqueous solution that is substantially saturated with respect to borax, providing in the solution a stabilizing agent selected from the group consisting of ferric, cupric and chromic salts, the concentration of said stabilizing agent being greater than about one tenth percent on the dry weight of the other solutes present, and then holding the solution continuously dur-

ing the said holding period under conditions for which the equilibrium solvebility with respect to borax is less than the existing borax concentration of the solution by an amount that is insufficient, by virtue of the presence of the said stabilizing agent, to cause appreciable crystallization of borax.

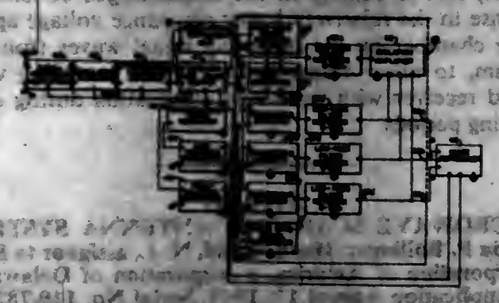
2,774,971
**COINCIDENCE FINDING CIRCUIT**
Robert B. Truesdale, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware.
Original application December 24, 1949, Serial No. 134,974. Divided and this application September 21, 1950, Serial No. 186,046.
86 Claims. (Cl. 179—18)



1. In an automatic telephone system, a plurality of lines having individually assigned thereto different time positions in repetitive time position frames, a finder-selector link including a finder and a selector, a pulse path common to said lines and extending to both said finder and said selector, multiplexer means responsive to the initiation of a call on one of said lines for transmitting pulses over said pulse path in the time position assigned to the calling line, and means in said finder responsive to said pulses for supplying a substantially unidirectional operating potential to said selector, thereby to condition said selector for operation.

59. In an automatic telephone system, a plurality of lines having individually assigned thereto different time positions in repetitive time position frames, a line finder, a plurality of coincidence tubes, pulse generating means for successively exciting said tubes with pulses in each of said time positions, means for impressing exciting pulses on said tubes in parallel in the time position assigned to a calling one of said lines, one of said tubes being rendered conductive in response to coincidental excitation by a pulse gated by said last named means and a pulse developed by said pulse generating means, and means controlled by conduction of said one tube for operatively associating said finder with the calling line.

83. In a line finder for seizing any calling one of a plurality of lines having individually assigned thereto different time positions which recur in repetitive time position frames, a plurality of control circuits, means for successively applying first pulses to said control circuits which occur in said time positions, means for applying second pulses to said control circuits in parallel in the time position assigned to a calling one of said lines, one of said control circuits responding to coincidental application of said first and second pulses thereto, pulse gating rectifiers individually associated with said control circuits and operative to gate different ones of said first pulses, means normally biasing said rectifiers against pulse gating therethrough, and means controlled by said one control circuit for changing the bias on the rectifier associated with said one control circuit to permit pulse gating therethrough.

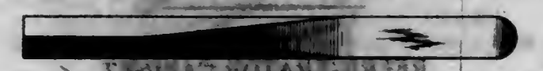
2,774,972
**COLOR-TELEVISION SYSTEM**
Bernard D. Loughlin, Lynbrook, N. Y., assignor to Hazeltine Research, Inc., Chicago, Ill., a corporation of Illinois
Application May 25, 1953, Serial No. 356,114
22 Claims. (Cl. 178—5.2)



1. In a color-television receiver for translating a composite video-frequency signal representative of a color image and having as components a monochrome signal and a subcarrier-wave signal modulated in amplitude and phase by color-signal components, a signal-translating system comprising: a circuit for supplying a composite video-frequency signal of the type described; a first signal-translating channel coupled to said supply circuit and including a network having a predetermined pass band for translating at least the low-frequency component of said monochrome signal; a second signal-translating channel coupled to said supply circuit and including means for translating said subcarrier wave signal and for deriving therefrom at least one signal representative of a color characteristic of said image and for translating said derived signal, said second channel discriminating against signals representative of said low-frequency component of said monochrome signal, said translated derived signal occupying a band overlapping said predetermined pass band; and output circuit means coupled to said first and second channels for supplying said translated monochrome-signal component and said derived signal.

Term of patent 14 years
(Cl. D44—15)

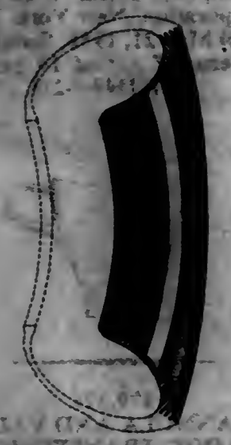
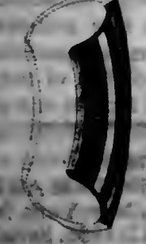
179,370
**CREAMER OR SIMILAR ARTICLE**
A. Baker Barnhart, New York, N. Y., assignor to Lacent Corporation, New York, N. Y.
Application May 21, 1956, Serial No. 41,552
Term of patent 14 years
(Cl. D44—21)

179,371
**COMBINED CANNULA AND VALVE UNIT FOR BLOOD TRANSFUSION**
Courtland H. Barr, Sr., Courtland H. Barr, Jr., and John W. Barr, Los Angeles, Calif.
Application December 27, 1955, Serial No. 39,500
Term of patent 14 years
(Cl. D65—1)

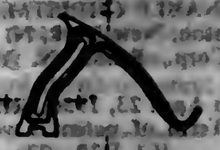


179,372
**WATCH OR SIMILAR ARTICLE**
Arthur Bauer, New York, N. Y.
Application January 17, 1955, Serial No. 34,001
Term of patent 3½ years
(Cl. D42—8)



179,373
**SMOKER'S PIPE OR SIMILAR ARTICLE**
Phil Bernazzo, Elizabeth, N. J.
Application April 19, 1956, Serial No. 41,136
Term of patent 14 years
(Cl. D65—8)

179,374
**TIRE**
Henry D. Bishop, Detroit, Mich., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application January 25, 1955, Serial No. 34,241
Term of patent 14 years
(Cl. D90—20)



179,375
**TIRE**
Henry D. Bishop, Detroit, and Edward H. Wallace, Grosse Pointe, Mich., assignors to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application January 25, 1955, Serial No. 34,191
Term of patent 14 years
(Cl. D90—20)

179,376
**SWIVEL CHAIR**
Theodore R. Breed, Wichita, Kans.
Application January 3, 1956, Serial No. 39,575
Term of patent 14 years
(Cl. D15—1)

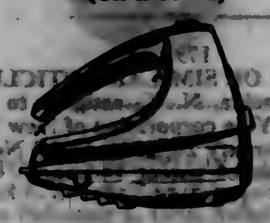
179,377
**FILE HANDLE**
Louis H. Cole, Bridgeport, Conn., assignor to Sako Aluminum Foundry, Inc., Kings Hwy., Fairfield, Conn.
Application November 9, 1954, Serial No. 33,634
Term of patent 7 years
(Cl. D37—1)

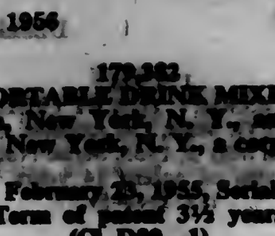
179,378
**FILE HANDLE**
Louis H. Cole, Bridgeport, Conn., assignor to Sako Aluminum Foundry, Inc., Kings Hwy., Fairfield, Conn.
Application November 9, 1954, Serial No. 33,635
Term of patent 7 years
(Cl. D37—1)

179,379
**REFRIGERATOR CABINET**
Donald E. Dudley, Center Township, Vanderburgh County, Ind., assignor to Servel, Inc., New York, N. Y., a corporation of Delaware
Application December 18, 1954, Serial No. 33,574
Term of patent 14 years
(Cl. D67—3)

179,380
**SET OF ORNAMENTAL INITIALS FOR JEWELRY**
Alfred Dane, Boston, Mass.
Application August 5, 1955, Serial No. 37,339
Term of patent 14 years
(Cl. D64—12)

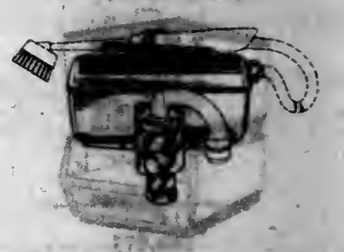
179,381
**SET OF ORNAMENTAL INITIALS FOR JEWELRY**
Alfred Dane, Boston, Mass.
Application August 5, 1955, Serial No. 37,340
Term of patent 14 years
(Cl. D64—12)





179,382
**PORTABLE DRINK MIXER**
Louis F. Dunin, New York, N. Y., assignor to Kathi Urbach, Inc., New York, N. Y., a corporation of New York
Application February 23, 1955, Serial No. 34,632
Term of patent 3½ years
(Cl. D69—1)

179,383
**ELECTRIC HAND MIXER**
Angelo C. DeAngelis, Fair Haven, N. J., and Eugene J. Casey, New York, N. Y., assignors to The Winsted Hardware Manufacturing Company, Winsted, Conn., a corporation of Connecticut
Application November 4, 1955, Serial No. 38,727
Term of patent 14 years
(Cl. D44—1)

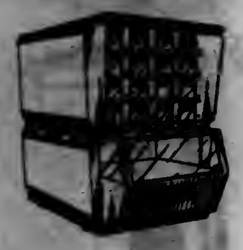


179,384
**MOTORTRICYCLE**
Marcello Ducati, Milan, Italy, assignor to Soc. p. Az. Fabbrica Automobili e Velocipedi "Edoardo Bianchi," Milan, Italy, a corporation of Italy
Application May 23, 1955, Serial No. 36,181
Claims priority, application Italy January 22, 1955
Term of patent 7 years
(Cl. D99—8)

179,385
**SALAD TOSSING FORK**
Elmer H. Geissler, Atlanta, Ga.
Application June 25, 1956, Serial No. 42,038
Term of patent 3½ years
(Cl. D44—29)

179,386
**DISHWASHER UNIT FOR SINKS**
George Grill, Toledo, Ohio, assignor to Corby-Michigan Corporation, Adrian, Mich., a corporation of Michigan
Application July 25, 1955, Serial No. 37,169
Term of patent 14 years
(Cl. D91—3)

179,387
**TEXTILE FABRIC**
William Edward Holt, Jr., Philadelphia, Pa., assignor to E. W. Twitchell, Inc., Philadelphia, Pa., a corporation of Delaware
Application March 27, 1956, Serial No. 40,897
Term of patent 3½ years
(Cl. D92—1)



179,388
**VAPORIZER STAND**
Max Katzman and Lawrence Katzman, New York, and Meyer Block, Port Washington, N. Y., assignors to Kaz Manufacturing Co., Inc., New York, N. Y., a corporation of New York
Application April 12, 1955, Serial No. 35,679
Term of patent 14 years
(Cl. D85—1)

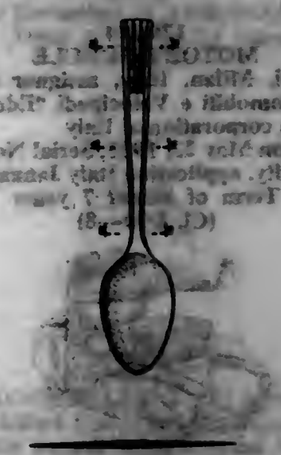
179,389
**COMBINED LETTER OPENER, ERASER, AND BRUSH**
Alfred T. Le Bont, Oakland, Conn.
Application October 7, 1955, Serial No. 38,289
Term of patent 14 years
(Cl. D74—1)

179,290
COMBINATION HEAT VENDING AND DISPLAY MACHINE
Anthony John Maiorana, Rensselaer, N. Y.
Application March 5, 1956, Serial No. 40,518
Term of patent 14 years
(Cl. D37—3)

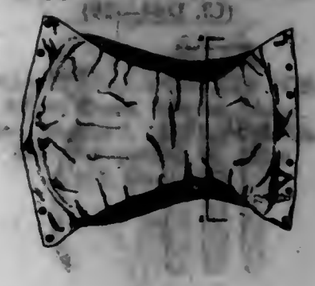
179,291
ORGAN CONSOLE
William Millington, Grand Rapids, Mich., and Wilbur M. Day, Kenwood, Ohio, assignors to The Baldwin Piano Company, Cincinnati, Ohio, a corporation of Ohio
Application June 6, 1956, Serial No. 41,780
Term of patent 14 years
(Cl. D56—3)

179,292
ORGAN CONSOLE
William Millington, Grand Rapids, Mich., and Wilbur M. Day, Kenwood, Ohio, assignors to The Baldwin Piano Company, Cincinnati, Ohio, a corporation of Ohio
Application June 6, 1956, Serial No. 41,781
Term of patent 14 years
(Cl. D56—3)

179,293
ORGAN CONSOLE
William Millington, Grand Rapids, Mich., and Wilbur M. Day, Kenwood, Ohio, assignors to The Baldwin Piano Company, Cincinnati, Ohio, a corporation of Ohio
Application June 29, 1956, Serial No. 42,092
Term of patent 14 years
(Cl. D56—2)



179,294
ACCESSORY TOILET CHAIR
Florence G. Mills, Los Angeles, Calif.
Application May 2, 1956, Serial No. 38,762
Term of patent 14 years
(Cl. D4—6)



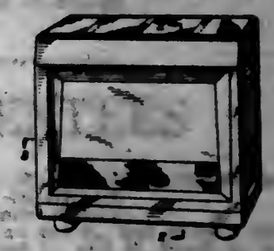
179,295
FLUSH TANK TOP
Clifton I. Pancoast, Washington, D. C.
Application April 6, 1956, Serial No. 38,361
Term of patent 14 years
(Cl. D4—6)

179,296
SPOON OR SIMILAR ARTICLE
Frank R. Perry, Oneida, N. Y., assignor to Oneida Ltd., Oneida, N. Y., a corporation of New York
Application February 28, 1956, Serial No. 40,223
Term of patent 14 years
(Cl. D44—12)

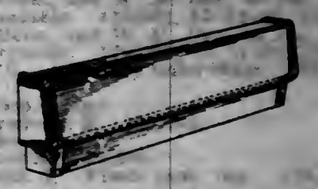
179,297
DIAPER
Paulyne M. Seydler, Stanfield, Ariz.
Application October 17, 1955, Serial No. 38,355
Term of patent 14 years
(Cl. D3—17)

179,298
SOUND RECORDER
Henry A. Sherwood, Woodbridge, Conn.
Application June 22, 1955, Serial No. 36,638
Term of patent 14 years
(Cl. D26—14)

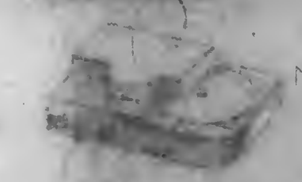
179,299
COOKIE JAR
Walter D. Starnes, Los Angeles, Calif., assignor to Walter Starnes, Inc., Los Angeles, Calif., a corporation of California
Application January 9, 1956, Serial No. 39,674
Term of patent 3½ years
(Cl. D58—25)



179,300
TOY LOCOMOTIVE CAB
Robert E. Svendl, East Paterson, N. J.
Application February 2, 1956, Serial No. 40,007
Term of patent 7 years
(Cl. D34—15)



179,301
THREAD GUARD
Helen Talbot, Wellsboro, Pa.
Application September 15, 1955, Serial No. 37,953
Term of patent 14 years
(Cl. D3—19)



179,302
CABINET FOR A HEATER OR THE LIKE
Lawrence H. Wilson, Detroit, Mich., assignor to Motor Wheel Corporation, Lansing, Mich., a corporation of Michigan
Application October 27, 1955, Serial No. 38,509
Term of patent 14 years
(Cl. D61—19)

179,303
BACK SPLASH PANEL UNIT FOR A COOKING RANGE
Lawrence H. Wilson, Detroit, Mich.
Application April 9, 1956, Serial No. 40,967
Term of patent 14 years
(Cl. D61—25)

# LIST OF REISSUE PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 11TH DAY OF DECEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Beaver, John F. Method of producing a composite liquid bituminous binder. Re. 24,253, 12–11–56, Cl. 204—82.

Dawson, Robert A. J. Deepwater submersible barge. Re. 24,254, 12–11–56, Cl. 61—46.5.

Dole Valve Co., The: *See*—
Lund, James K. Re. 24,255.

Lund, James K., to The Dole Valve Co. Fluid mixing valve. Re. 24,255, 12–11–56, Cl. 137—606.

Smith, Clarence E. Crop dusting machine. Re. 24,256, 12–11–56, Cl. 43—148.

# LIST OF PLANT PATENTEES

Boerner, Eugene S., to Jackson & Perkins Co. Rose plant. 1,535, 12–11–56, Cl. 47—61.

Cole, David B., to The Cole Nursery Co. Honey locust tree. 1,534, 12–11–56, Cl. 47—59.

Cole Nursery Co., The: *See*—
Cole, David B. 1,534.

Grullemans, John J.: *See*—
Pike, Albert V. 1,536.

Jackson & Perkins Co.: *See*—
Boerner, Eugene S. 1,535.

Merrill, Grant. Peach tree. 1,538, 12–11–56, Cl. 47—62.

Motose, Thomas H. Rose plant. 1,537, 12–11–56, Cl. 47—61.

Pike, Albert V., to J. J. Grullemans. Hybrid buddleia plant. 1,536, 12–11–56, Cl. 47—60.

# LIST OF DESIGN PATENTEES

Abramson, Abraham, to Raylite Electric Corp. Illuminable Christmas plaque. 179,266, 12–11–56, D29—23.

Allen, R. S. and A. Filley. Water ski or similar article. 179,267, 12–11–56, D71—4.

Baldwin Piano Co., The: *See*—
Millington, William, and Day. 179,391.
Millington, William, and Day. 179,392.
Millington, William, and Day. 179,393.

Barnhart, A. Baker, to The Rosenthal-Block China Corp. Plate or similar article. 179,263, 12–11–56, D44—15.

Barnhart, A. Baker, to Lucent Corp. Bowl or similar article. 179,269, 12–11–56, D44—15.

Barnhart, A. Baker, to Lucent Corp. Creamer or similar article. 179,270, 12–11–56, D44—31.

Barr, Courtland H., Jr.: *See*—
Barr, Courtland H., Sr., C. H. Barr, Jr., and J. W. Barr. 179,371.

Barr, Courtland H., Sr., C. H. Barr, Jr., and J. W. Barr. Combined cannula and valve unit for blood transfusion. 179,371, 12–11–56, D83—1.

Barr, John W.: *See*—
Barr, Courtland H., Sr., C. H. Barr, Jr., and J. W. Barr. 179,371.

Bauer, Arthur. Watch or similar article. 179,372, 12–11–56, D42—6.

Berenson, Phil. Smoker's pipe or similar article. 179,373, 12–11–56, D65—8.

Bishop, Henry D., to United States Rubber Co. Tire. 179,374, 12–11–56, D90—20.

Bishop, Henry D., and R. H. Wallace, to United States Rubber Co. Tire. 179,375, 12–11–56, D90—20.

Block, Meyer: *See*—
Katzman, Max and L., and Block. 179,388.

Breed, Theodore R. Swivel chair. 179,376, 12–11–56, D13—1.

Casey, Eugene J.: *See*—
De Angelis, Angelo C., and Casey. 179,383.

Cole, Louis H., to Sako Aluminum Foundry, Inc. File handle. 179,377, 12–11–56, D67—1.

Cole, Louis H., to Sako Aluminum Foundry, Inc. File handle. 179,378, 12–11–56, D67—1.

Dailey, Donald E., to Servel, Inc. Refrigerator cabinet. 179,379, 12–11–56, D67—3.

Dana, Alfred. Set of ornamental initials for jewelry. 179,380, 12–11–56, D64—12.

Dana, Alfred. Set of ornamental initials for jewelry. 179,381, 12–11–56, D64—12.

Danis, Louis F., to Kathi Urbach, Inc. Portable drink mixer. 179,382, 12–11–56, D69—1.

Day, Wilbur M.: *See*—
Millington, William, and Day. 179,391.
Millington, William, and Day. 179,392.
Millington, William, and Day. 179,393.

De Angelis, Angelo C., and E. J. Casey, to The Winsted Hardware Mfg. Co. Electric hand mixer. 179,383, 12–11–56, D44—1.

Ducati, Marcello, to Soc. p. Az. Fabbrica Automobili e Velocipedi "Edoardo Bianchi", Motortricycle. 179,384, 12–11–56, D90—8.

Filley, Archie: *See*—
Allen, R. S., and Filley. 179,267.

Geissler, Elmer H. Salad tossing fork. 179,385, 12–11–56, D44—29.

Gerity-Michigan Corp.: *See*—
Graf, George. 179,386.

Graf, George, to Gerity-Michigan Corp. Dishwasher unit for sinks. 179,386, 12–11–56, D91—3.

Holt, William E., Jr., to E. W. Twitchell, Inc. Textile fabric. 179,387, 12–11–56, D92—1.

Katzman, Lawrence: *See*—
Katzman, Max and L., and Block. 179,388.

Katzman, Max and L., and M. Block, to Kas Mfg. Co., Inc. Vaporizer stand. 179,388, 12–11–56, D62—1.

Kas Mfg. Co., Inc.: *See*—
Katzman, Max and L., and Block. 179,388.

Le Beau, Alfred T. Combined letter opener, eraser, and brush. 179,389, 12–11–56, D74—1.

Lucent Corp.: *See*—
Barnhart, A. Baker. 179,269.
Barnhart, A. Baker. 179,270.

Maddalena, Anthony J. Combination meat vending and display machine. 179,390, 12–11–56, D62—3.

Millington, William, and W. M. Day, to The Baldwin Piano Co. Organ console. 179,391, 12–11–56, D66—2.

Millington, William, and W. M. Day, to The Baldwin Piano Co. Organ console. 179,392, 12–11–56, D66—2.

Millington, William, and W. M. Day, to The Baldwin Piano Co. Organ console. 179,393, 12–11–56, D66—2.

Mills, Florence G. Accessory toilet chair. 179,394, 12–11–56, D4—8.

Motor Wheel Corp.: *See*—
Wilson, Lawrence H. 179,402.

Oneida Ltd.: *See*—
Perry, Frank R. 179,396.

Panciera, Clifton I. Flush tank top. 179,395, 12–11–56, D4—5.

Perry, Frank R., to Oneida Ltd. Spoon or similar article. 179,396, 12–11–56, D64—12.

Raylite Electric Corp.: *See*—
Abramson, Abraham. 179,266.

Rosenthal-Block China Corp., The: *See*—
Barnhart, A. Baker. 179,263.

Sako Aluminum Foundry, Inc.: *See*—
Cole, Louis H. 179,377.
Cole, Louis H. 179,378.

Servel, Inc.: *See*—
Dailey, Donald E. 179,379.

Seydler, Paulyne M. Diaper. 179,397, 12–11–56, D8—17.

Sherwood, Henry A. Sound recorder. 179,398, 12–11–56, D26—14.

Soc. p. Az. Fabbrica Automobili e Velocipedi "Edoardo Bianchi": *See*—
Ducati Marcello. 179,384.

Starnes, Walter D., to Walter Starnes, Inc. Cookie jar. 179,399, 12–11–56, D58—26.

Starnes, Walter, Inc.: *See*—
Starnes, Walter D. 179,399.

Svoail, Robert E. Toy locomotive cab. 179,400, 12–11–56, D34—15.

Talbot, Helen. Thread guard. 179,401, 12–11–56, D3—19.

Twitchell, E. W., Inc.: *See*—
Holt, William E., Jr. 179,387.

United States Rubber Co.: *See*—
Bishop, Henry D. 179,374.
Bishop, Henry D., and Wallace. 179,375.

Urbach, Kathi, Inc.: *See*—
Danis, Louis F. 179,382.

Wallace, Edward H.: *See*—
Bishop, Henry D., and Wallace. 179,375.

Wilson, Lawrence H., to Motor Wheel Corp. Cabinet for a heater or the like. 179,402, 12–11–56, D61—19.

Wilson, Lawrence H. Back splash panel unit for a cooking range. 179,403, 12–11–56, D61—25.

Winsted Hardware Mfg. Co., The: *See*—
De Angelis, Angelo C., and Casey. 179,383.

# LIST OF PATENTEES

Berdelle-Hilge, Philipp, Schreiner, Blessing, and Stöhr. 2,773,454.
Hilgert, Adolph J., to Milwaukee Gas Specialty Co. Circuit-controlling device. 2,773,649, 12–11–56, Cl. 236—21.
Hill, John L. Magazine and cartridge container assembly. 2,773,325, 12–11–56, Cl. 42—50.
Hiller, Lejaren A., Jr., and F. H. Sweney, to E. I. du Pont de Nemours & Co. Pretreatment and esterification of cellulose. 2,773,996, 12–11–56, Cl. 260—229.
Himmelman, Louis F. Kinesitherapy device. 2,773,498, 12–11–56, Cl. 128—33.
Hinkel, Lester H., to Whirlpool-Seeger Corp. Inner liner with butter compartment for refrigerator door. 2,773,677, 12–11–56, Cl. 257—9.
Hirak, Joseph. Writing pad support or desk for vehicles. 2,773,705, 12–11–56, Cl. 281—44.
Hirschmann, Jack B. Goggles. 2,773,260, 12–11–56, Cl. 2—14.
Hoard, Halbert W., D. A. Olson, and T. A. Vallee, to Unilectric, Inc. Combined lamp guard and socket mounting device. 2,773,973, 12–11–56, Cl. 240—4.
Hoch, Paul H., and R. W. Wynn, to General Aniline & Film Corp. Organic film-forming plastic containing 2,2',4,4-tetrahydroxybenzophenone as ultraviolet absorbent. 2,773,778, 12–11–56, Cl. 106—187.
Hochberg, Jerome, and S. A. Pellerano, to Allied Chemical & Dye Corp. Compositions for decorative purposes. 2,773,856, 12–11–56, Cl. 260—33.8.
Hockert, Chester H.: *See*—
Castle, William S., and Hockert. 2,773,711.
Hoffmann-La Roche Inc.: *See*—
Finkelstein, Jacob, and Lee. 2,773,875.
Wenner, Wilhelm. 2,773,877.
Holappa, John E., to H. B. Heyster & Associates, Inc. Automobile parking machine. 2,773,600, 12–11–56, Cl. 214—16.1.
Holding Intercite S. A.: *See*—
Mahmoud, Georges, and Rubli. 2,773,263.
Holliday, Clyde T.: *See*—
Roberts, Richard B., Petersen, and Holliday. 2,773,732.
Hollingsworth, Clinton A., to Smith-Douglass Co., Inc. Treatment of phosphate rock to recover phosphorus, fluorine, calcium, and uranium. 2,773,730, 12–11–56, Cl. 23—14.5.
Holloway, Robert L., to American Machine & Foundry Co. Reversible bicycle frame. 2,773,695, 12–11–56, Cl. 280—7.11.
Hollywood-Maxwell Co.: *See*—
Schaumer, Theo B. 2,773,961.
Holmes, Ellis C., and W. D. Greene. Drilling bit. 2,773,672, 12–11–56, Cl. 255—61.
Holt, William A. Roll-a-way bed. 2,773,269, 12–11–56, Cl. 5—152.
Hood, E. Elliott, to Bendix Aviation Corp. Freezemeter. 2,773,376, 12–11–56, Cl. 73—17.
Hood, E. Elliott, to Bendix Aviation Corp. Freezemeter. 2,773,379, 12–11–56, Cl. 73—17.
Hood, Ralph E., to Monsanto Chemical Co. Production of refractory metals. 2,773,759, 12–11–56, Cl. 75—84.5.
Hooper, Leslie J., and C. R. Kronoff, to Crompton & Knowles Loom Works. Liquid picking mechanism. 2,773,517, 12–11–56, Cl. 139—142.
Hopla, Lloyd M. Guide device for portable power saws. 2,773,523, 12–11–56, Cl. 143—6.
Hornfeck, Anthony J., to Bailey Meter Co. Electric servo system for measuring and control. 2,774,019, 12–11–56, Cl. 318—29.
Housley, Thomas P. Holder for game blocks. 2,773,690, 12–11–56, Cl. 272—130.
Hoyne, Benjamin L., to American Can Co. Feeding device for can end testing machine. 2,773,380, 12–11–56, Cl. 73—45.2.
Hübner, Franz K., to Victory Produkter Aktiebolag. Spinning type fishing reel. 2,773,654, 12–11–56, Cl. 242—84.4.
Huck Co.: *See*—
Huck, William F. 2,773,412.
Huck, William F., to Huck Co. Electro-optical device for measuring thicknesses of coatings on materials. 2,773,412, 12–11–56, Cl. 88—14.
Hudson, George G., to Reconstruction Finance Corp. Aircraft ejection seat. 2,773,661, 12–11–56, Cl. 244—122.
Hudson, Paul S., M. F. Potts, and W. L. Smith, to Phillips Petroleum Co. Stabilization of polymerizable heterocyclic nitrogen compounds. 2,773,874, 12–11–56, Cl. 260—290.
Hughes Aircraft Co.: *See*—
Berger, Netardus N., and Norton. 2,773,665.
Hughes, William J., to Shell Development Co. Herbicidal composition and method. 2,773,331, 12–11–56, Cl. 47—58.
Hults, Ellsworth H.: *See*—
Woodworth, Frederick B., and Hults. 2,773,932.
Huma, George: *See*—
Dodds, Nugent. 2,773,474.
Hunt, Robert H., and J. Nagy. Material handling apparatus of the conveyor type. 2,773,608, 12–11–56, Cl. 214—14.
Hunter, James B., to The Atlantic Refining Co. Silver-palladium film for separation and purification of hydrogen. 2,773,561, 12–11–56, Cl. 183—115.
Hunting, Ronald W. Process and apparatus for subsurface washing. 2,773,829, 12–11–56, Cl. 210—24.
Hurko, Bohdan, and E. P. Robare, to American Radiator & Standard Sanitary Corp. Flush valve. 2,773,268, 12–11–56, Cl. 4—57.
Hurlburt, Charles E., and R. H. Deahl, to Bendix Aviation Corp. Frequency subdivider in a flux valve compass system. 2,773,985, 12–11–56, Cl. 250—36.
Harley, Charles W., to the United States of America as represented by the Secretary of the Army. Resilient disc closure. 2,773,621, 12–11–56, Cl. 220—39.
Huyett, Daniel D., to Atlas Powder Co. Multiple assembling machine for electric blasting initiators. 2,773,408, 12–11–56, Cl. 86—10.
I-T-E Circuit Breaker Co.: *See*—
Edmunds, William H. 2,773,949.

Lien, Arthur P.: *See*—
Shalit, Harold, and Lien. 2,773,836.

Liljenström, Carl J., to AB Svenska Flaktfabriken. Method and drying kiln for drying lumber. 2,773,315, 12–11–56, Cl. 34—209.

Lilly, Eli, and Co.: *See*—
Mills, Jack. 2,773,900.
Powell, Horace M. 2,773,800.

Lin, Tung H. Accelerometer. 2,774,062, 12–11–56, Cl. 340—249.

Lindblom, Frank W., to Welsh Mfg. Co. Bridge structure. 2,773,423, 12–11–56, Cl. 52—43.

Lindenfelser, Richard, to American Cyanamid Co. Resinous compositions. 2,773,848, 12–11–56, Cl. 260—17.3.

Lindner, Adam C., to Chicago Forging and Mfg. Co. Hood latch. 2,773,716, 12–11–56, Cl. 292—282.

Lindorf, Eugene A. Floor drain seal. 2,773,554, 12–11–56, Cl. 182—24.

Litochleb, Joseph: *See*—
Dvorak, Joseph F. 2,773,408.

Little, Ernest L., Jr., to E. I. du Pont de Nemours and Co. 1-amino-1-halo-2,2-dicyanoethylenes and preparation of same. 2,773,892, 12–11–56, Cl. 260—465.5.

Litus, John, and C. D. Smith, to Food Machinery and Chemical Corp. Screen cleaning device. 2,773,590, 12–11–56, Cl. 209—256.

Lobosco, Ecorse R.: *See*—
Galbraith, John F., Helmbrecht, and Lobosco. 2,773,970.

Locke, Burton H. Materials piling devices. 2,773,607, 12–11–56, Cl. 214—6.

Loew's Inc.: *See*—
Stanford, Jerome W., and Frierson. 2,774,054.

Logan, Ralph L., to J. G. McAlister Inc. Socket for studio lamp or the like. 2,774,050, 12–11–56, Cl. 339—75.

Lorens, Richard L., to General Time Corp. Workman's in-and-out recorder. 2,773,733, 12–11–56, Cl. 346—84.

Loughlin, Bernard D., to Haseltine Research, Inc. Constant luminance color-television. 2,773,929, 12–11–56, Cl. 178—5.2.

Loughlin, Bernard D., to Haseltine Research, Inc. Color-television system. 2,774,072, 12–11–56, Cl. 178—5.2.

Lowry, Robert: *See*—
Carruthers, Edward G., and Lowry. 2,773,469.

Ludwig, Adolf G.: *See*—
Binder, Richard L., and Ludwig. 2,773,575.

Lugli, Giuseppe, and C. Massa, to Pirelli Societa per Azioni. Pneumatic vehicle wheel tire castings. 2,773,534, 12–11–56, Cl. 152—356.

Lukens Steel Co.: *See*—
Edwards, Lewis W., and West. 2,773,614.
Watson, Thomas T. 2,773,302.
West, Russell A., and Edwards. 2,773,612.

Lundahl, Lennart V. S. Clamping device for closing a fluid or paste container. 2,773,627, 12–11–56, Cl. 222—107.

Lunstroth, Klaus, to National Lead Co. Production of well drilling starches. 2,773,783, 12–11–56, Cl. 127—32.

Lurgi Gesellschaft fuer Waermetechnik m. b. H.: *See*—
Bottig, Walter. 2,773,690.

Lutes, Donald. Electrical indicating mechanism. 2,773,579, 12–11–56, Cl. 194—8.

MacCracken, Calvin D., G. N. Miles, and T. N. Ashidate, to Jet-Heet, Inc. Boiler-burner unit. 2,773,488, 12–11–56, Cl. 122—161.

Machalek, Ferdinand: *See*—
Dvorak, Joseph F. 2,773,408.

MacIver, Charles P., to the United States of America as represented by the Secretary of the Army. Armored garment. 2,773,791, 12–11–56, Cl. 154—82.5.

Mack, Robert J. Shell high trimming attachment. 2,773,299, 12–11–56, Cl. 29—67.

Magidson, Frank, to Pittsburgh Tag Co. Mechanical actuator for manual stapler. 2,773,258, 12–11–56, Cl. 1—3.

Magrane, John K., and W. S. Sloatman, Jr., to American Cyanamid Co. Laminate and resinous composition. 2,773,788, 12–11–56, Cl. 154—43.

Majkrzak, Charles P., to International Telephone and Telegraph Corp. Point contact device for high voltage radio frequency apparatus. 2,773,964, 12–11–56, Cl. 200—166.

Maki, Bunro, and I. Ushikoshi; said Ushikoshi assor. to said Maki. Feeds containing animal protein factors, vitamin $B_{12}$ and other growth-promoting factors. 2,773,770, 12–11–56, Cl. 99—9.

Malamoud, Georges, and M. Rubli, to Holding Intercito S. A. Hydraulic press for producing coated electrode rods. 2,773,283, 12–11–56, Cl. 18—13.

Mallick, Franklin S., to Westinghouse Electric Corp. Motor control system. 2,774,022, 12–11–56, Cl. 318—207.

Mandolf, Henry I., to Langley Corp. Fishing reel. 2,773,655, 12–11–56, Cl. 242—84.4.

Manufacture des Montres Universal, Perret & Berthoud, S. A.: *See*—
Froideraux, Jean-Michel. 2,773,347.

Marchant Calculators, Inc.: *See*—
Mathi, Walter E. 2,773,646.

Marden, John W.: *See*—
Beese, Norman C., and Marden. 2,773,826.

Markett, George. Flashlight screw driver. 2,773,974, 12–11–56, Cl. 240—8.46.

Marres, George: *See*—
Thompson, Norman F., 3rd, and Marres. 2,773,548.

Martellotti, Mario, and J. W. Evans, to The Cincinnati Milling Machine Co. Electro discharge machine. 2,773,968, 12–11–56, Cl. 219—69.

Martin, Edward G. Photographic film identification. 2,773,436, 12–11–56, Cl. 95—1.1.

Martin, Gilbert, to Etablissements Neyrpic. Semi-spiral scroll case. 2,773,666, 12–11–56, Cl. 253—26.

Martin, Henry, and H. Zutter, to Clag Ltd. Alkenoic amides of arylethers of alkanolamines. 2,773,880, 12–11–56, Cl. 260—562.

Martin, Hollinshead T., to Signode Steel Strapping Co. Strap cutter. 2,773,307, 12–11–56, Cl. 30—194.

Martin, Jonathan. Bird nibbler. 2,773,472, 12–11–56, Cl. 119—18.

Martin, Stuart T., and M. C. Pease, to Sylvania Electric Products Inc. High frequency window structure. 2,773,230, 12–11–56, Cl. 20—40.

Mascher, Floyd J., D. Kissinger, and A. Clagg. Grease gun. 2,773,630, 12–11–56, Cl. 222—256.

Maschinenfabrik Augsburg-Nurnberg A. G.: *See*—
Heurich, Josef, and Garve. 2,773,553.

Wheelbarger, Albert S., and Warrick. 2,773,640.

Rodman, Ernest A., to E. I. du Pont de Nemours and Co. Coated article and method of making. 2,773,781, 12–11–56, Cl. 117—138.8.

Rooks, Howard B., to Capehart-Farnsworth Co., a division of International Telephone and Telegraph Corp. Time delay space charge device. 2,774,008, 12–11–56, Cl. 315—21.

Roper Associates, Inc.: *See*—
Roper, John H. 2,773,827.

Roper, John H., to Roper Associates, Inc. Electrical precipitators. 2,773,527, 12–11–56, Cl. 204—305.

Rose, Archie D. Fusee or flare holder. 2,773,662, 12–11–56, Cl. 246—488.

Rosenkrans, George, and C. Djerassi, to Syntex S. A. Pregnane-11β, 17α-diol-3,20-diones, esters thereof and process. 2,773,887, 12–11–56, Cl. 260—397.45.

Rosenstein, Ludwig: *See*—
Gorin, Manuel H., and Rosenstein. 2,773,858.

Ross, Fred A.: *See*—
Fulk, James B. 2,773,688.

Ross, Karl F. Radio location system. 2,774,065, 12–11–56, Cl. 343—9.

Ross, Malcolm D., to Westinghouse Electric Corp. Oriented-steel stator-cores. 2,774,000, 12–11–56, Cl. 310—216.

Rothlein, Bernard J., and F. A. Stahl, to Sylvania Electric Products Inc. Electrical translator and methods. 2,773,925, 12–11–56, Cl. 136—89.

Rottig, Walter, to Ruhrchemie Aktiengesellschaft and Lurgi Gesellschaft fuer Waermetechnik m. b. H. Catalytic carbon monoxide hydrogenation with an increased yield of higher boiling esters. 2,773,890, 12–11–56, Cl. 260—449.6.

Routien, John B.: *See*—
Shull, Gilbert M., Routien, and Finlay. 2,773,673.

Rowe, Richard G., and G. Flower, Jr., to Dictaphone Corp. Production of anti-static plastics. 2,773,852, 12–11–56, Cl. 260—32.6.

Royal Electric Co., Inc.: *See*—
Baesinger, Leonard N. 2,774,049.
Levinson, Benjamin L. 2,773,590.

Roselle, Rexford A., to Nachman Corp. Adjustable inner-spring unit. 2,773,270, 12–11–56, Cl. 5—253.

Rubber-Stichting: *See*—
Schuur, Gerrit. 2,773,922.

Rubli, Max: *See*—
Malamoud, Georges, and Rubli. 2,773,283.

Rudberg, Frank: *See*—
Denysson, Ivanhoe P. and Rudberg. 2,773,582.

Ruhrchemie Aktiengesellschaft: *See*—
Rottig, Walter. 2,773,890.

Rummelsburg, Alfred L., to Hercules Powder Co. Rosin polymerization process. 2,773,859, 12–11–56, Cl. 260—99.5.

Rush, Thomas L. Safety control for vehicles. 2,773,993, 12–11–56, Cl. 307—10.

Russell, Francis R.: *See*—
Nicholson, Edward W. S., and Russell. 2,773,811.

Russell, John J., W. A. Beck, and J. Kollman, to Elco Products Co. Composite metal and articles thereof. 2,773,817, 12–11–56, Cl. 204—37.

Ruth, Joseph P. Exhaust gas conditioning method. 2,773,735, 12–11–56, Cl. 23—2.

Rusicka, Leopold, H. Heusser, and O. Jeger, to Ciba Pharmaceutical Products, Inc. Process for the manufacture of compounds of the steroid series. 2,773,884, 12–11–56, Cl. 260—397.2.

Rylander, Paul N., Jr., and W. J. Zimmerschied, to Standard Oil Co. Phosphoric acid-vanadium pentoxide catalyst and hydrocarbon conversions therewith. 2,773,921, 12–11–56, Cl. 260—683.15.

Rystan Co.: *See*—
Graskin, Benjamin. 2,773,802.

S. & W. Sewing Machine Attachment Co.: *See*—
Seaman, Edward L. 2,773,462.

Safke, William T. Safety device for tractor-trailer fifth wheel. 2,773,701, 12–11–56, Cl. 280—432.

Safke, William T. Jack-knifing preventing device for tractor-trailers. 2,773,702, 12–11–56, Cl. 280—432.

Samcoe Holding Corp.: *See*—
Cohn, Samuel and E., and Walter. 2,773,296.

Samuel, Arthur L., to Bell Telephone Laboratories, Inc. Transmitting and receiving circuits for wave transmission systems. 2,774,066, 12–11–56, Cl. 343—13.

Sanders, Theodorus P. W., and J. H. A. Wildeis, to Chemische Fabriek L. van der Grinten N. V. Light-sensitive diazotype material. 2,773,768, 12–11–56, Cl. 96—75.

Sanders, Thomas A. and F. Kahn. Tool and method for compression splicing of wires and cables. 2,773,405, 12–11–56, Cl. 81—15.5.

Sandor, William C., to The Universal Wire Spring Co. Coupling connection for wire spring structures. 2,773,543, 12–11–56, Cl. 155—179.

Saputo, James J.: *See*—
Kaslow, Arthur L., and Saputo. 2,773,502.

Sauer, Alfred E., to B. A. Ballou & Co., Inc. Pin stem finding. 2,773,292, 12–11–56, Cl. 24—167.

Saxon, Cecil C. Resilient draft means with plural articulation axes. 2,773,704, 12–11–56, Cl. 280—480.

Schade, Otto H., Sr., to Radio Corp. of America. Apparatus for and method of measuring the quality of optical devices. 2,773,413, 12–11–56, Cl. 88—14.

Schaumer, Theo B., to Hollywood-Maxwell Co. Brassiere. 2,773,261, 12–11–56, Cl. 2—42.

Scheitlin, Thomas G., to Whirlpool-Seeger Corp. Refrigerators for freezing food and storage of frozen food. 2,773,362, 12–11–56, Cl. 62—117.3.

Schering Corp.: *See*—
Oliveto, Eugene P., and Hershberg. 2,773,883.

Schiavo, Dominic P. Bubble energized filter for aquarium. 2,773,839, 12–11–56, Cl. 210—16.

Schjolin, Hans O., and D. K. Isbell, to General Motors Corp. Drive wheel and brake assembly. 2,773,553, 12–11–56, Cl. 180—75.

Schlesinger, Arthur H., to Monsanto Chemical Co. Herbicidal compositions. 2,773,758, 12–11–56, Cl. 71—2.3.

Schmidt, Maxilian P.: *See*—
Sas, Oskar, Schmidt, and Glos. 2,773,765.

Schmidt-Nickels, Wilhelm: *See*—
Randall, David I., and Schmidt-Nickels. 2,773,873.

Schmidtke, Edward H. Elevator conveyor. 2,773,586, 12–11–56, Cl. 198—233.

Schmollinger, William F., to Chase Brass & Copper Co., Inc. Methods of extruding high copper alloys. 2,773,593, 12–11–56, Cl. 207—10.

Schneider, Edgar W.: *See*—
Dubois, Laurent Q., Gartside, Johnson, and Schneider. 2,773,911.

Schrader, Robert J., to Eastman Kodak Co. Process of preventing corrosion in the production of alcohols by hydration of olefins. 2,773,910, 12–11–56, Cl. 260—641.

Schreiber, Eric C.: *See*—
Laubach, Gerald D., and Schreiber. 2,773,885.

Wolthan, Heins H.: *See*—
Brinkmann, Georg, and Wolthan. 2,773,898.

Wood, James R., to Harris-Seybold Co. Throwoff mechanism for printing presses. 2,773,445, 12–11–56, Cl. 101—218.

Woodworth, Frederick B., and E. H. Hults, to Smith-Meeker Engineering Co. Public address system for subway trains. 2,773,932, 12–11–56, Cl. 179—1.

Worthington Corp.: *See*—
Steven, George. 2,773,493.

Wright, Henry H.: *See*—
Harder, Clarence L., and Wright. 2,773,773.

Wurts, Clifford H.: *See*—
Jacobs, James W., and Wurts. 2,773,361.

Wyckoff, Paul W., to Chrysler Corp. Air conditioner. 2,773,675, 12–11–56, Cl. 257—8.

Wynn, Robert W.: *See*—
Hoch, Paul E., and Wynn. 2,773,778.

Yardley International Corp.: *See*—
Brill, Otto H., and Brown. 2,773,924.

Yarnall-Waring Co.: *See*—
Miller, Frank W. 2,773,387.

Yeoman, Theodore. Storage battery cell unit acid container. 2,773,927, 12–11–56, Cl. 136—166.

Young, Harold S. Intraosseous fluid injection instrument. 2,773,500, 12–11–56, Cl. 128—218.

Young, Harold S. Drill element for effecting intraosseous fluid injections and the like. 2,773,501, 12–11–56, Cl. 128—221.

Young, Louis B., to the United States of America as represented by the Secretary of the Navy. Frequency comparator. 2,774,034, 12–11–56, Cl. 324—56.

Zapp, John A., Jr.: *See*—
Brouha, Lucien A., Smith, and Zapp. 2,773,262.

Zeiss Ikon, A. G.: *See*—
Ulfers, Heins. 2,773,417.

Zenith Radio Corp.: *See*—
Christensen, Raymond T. 2,773,942.

Zimmerschied, Wilford J.: *See*—
Rylander, Paul N., Jr., and Zimmerschied. 2,773,921.

Zipser, David B., to Tenney Engineering, Inc. Cooler unit. 2,773,364, 12–11–56, Cl. 62—140.

Zottoli, Robert A. Device for weaning young animals. 2,773,475, 12–11–56, Cl. 119—71.

Zoszulia, Igor V., to Tormag Transmissions Ltd. Agitators. 2,773,680, 12–11–56, Cl. 259—108.

Zur Nieden, Harald H. Hydraulically actuated intermittent drive in physical therapy apparatus. 2,773,499, 12–11–56, Cl. 128—75.

Zutter, Hans: *See*—
Martin, Henry, and Zutter. 2,773,899.

# CLASSIFICATION OF PATENTS

## ISSUED DECEMBER 11, 1956

NOTE.—First number=class, second number=subclass, third number=patent number

1— 3: 2,773,288
44.5: 2,773,289
2— 14: 2,773,290
42: 2,773,291
81: 2,773,292
96: 2,773,293
189: 2,773,294
258: 2,773,295
278: 2,773,296
4— 13: 2,773,297
57: 2,773,298
5— 132: 2,773,299

Applications Filed During the Month of October 1956—1,925

Registrations Issued ..... 370—No. 638,235 to No. 638,604
Renewals Issued ..... 57

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington 25, D. C., to whom all subscriptions should be made payable and all communications addressed; subscription price, $10.00 per annum, foreign mailing $2.00 additional; single copies, 20 cents each.

# MARKS PUBLISHED FOR OPPOSITION

**The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Notice of opposition under section 13 may be filed within thirty days of this publication. See Rules 20.1 to 20.5.**

**As provided by section 31 of said act, a fee of twenty-five dollars must accompany each notice of opposition.**

## CLASS 1

### RAW OR PARTLY PREPARED MATERIALS

SN 680,771. Thiem Products, Inc., West Allis, Wis. Filed June 17, 1955.

Applicant disclaims the words "Pulverizing," "We Grind the Earth," and "Coal" apart from the mark as shown.

For Ground and Pulverized Coal Used as an Additive in Foundry Sand.

First use Mar. 10, 1955.

SN 1,151. The Diamond Match Company, New York, N. Y. Filed Jan. 20, 1956.

**"NEET-HEET"**

For Charcoal Briquettes.

First use Aug. 29, 1955.

SN 2,130. Greer Industries, Inc., Jamaica, N. Y. Filed Feb. 6, 1956.

**disoflex**

For Sheets of Synthetic Elastic Material.

First use Dec. 7, 1955.

SN 4,190. Foams, Inc., Port Washington, Wis. Filed Mar. 9, 1956.

**KLEEN-O**

For Polyurethane Resin Sponges.

First use Feb. 23, 1956.

SN 6,327. Feuer Hide & Skin Corp., New York, N. Y. Filed Apr. 13, 1956.

**GOLD COAST BUCK**

Exclusive use of the word "Buck" is disclaimed apart from the mark as shown.

For Leather.

First use Mar. 1, 1956.

SN 6,661. Garfield Williamson, Inc., d. b. a. Plant Food Products Co., Jersey City, N. J. Filed Apr. 18, 1956.

**FOUR SEASON**

For Grass Seed.

First use January 1956.

SN 7,027. Oregon Purebred Nutria Associates, Portland, Oreg. Filed May 2, 1956.

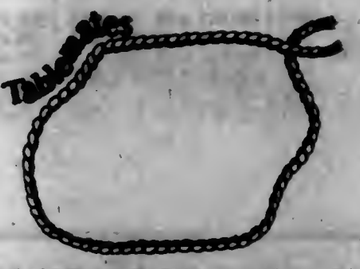
**OPNA**

For Nutria Pelts and Live Nutria.

First use October 1955 for live nutria.

## CLASS 2

### RECEPTACLES



SN 4,534. The Fuller Label & Box Company, Pittsburgh, Pa. Filed Mar. 14, 1956.

**Ful-Seal**

For Cartons, Boxes, and Rigid and Semi-Rigid Box and Crate Inner Liners, Which Articles Are Manufactured With a Heatseal Coating Adhesive.

First use Feb. 23, 1956.

SN 9,128. Enco Inc., New York, N. Y. Filed May 28, 1956.

For Salt and Pepper Shakers.

First use Feb. 1, 1956.

SN 9,175. Richard Manufacturing Co., Van Nuys, Calif. Filed May 28, 1956.

**POLY-CONS**

For Polyethylene Containers for Processed Film, Commercial, Household, and Other Uses.

First use Mar. 14, 1956.

## CLASS 3

### BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS

SN 13,935. Jack R. Shevin, d. b. a. Dard Products, Chicago, Ill. Filed Aug. 14, 1956.

**TAG-MASTER**

For Key Cases and Key Tags.

First use February 1951.

SN 14,439. E. Roy Dallas, Detroit, Mich. Filed Aug. 23, 1956.

**U-R-VALET**

For Luggage.

First use Aug. 20, 1956.

SN 14,883. J. Jones and Company, San Francisco, Calif. Filed Aug. 29, 1956. Sec. 2(f).

**CARO**

For Suit Bags, Brief Cases, Dispatch Cases, Wallets, Pocket Books, Key Cases, Utility Cases, Covered Jewel Cases, and the Like.

First use on or about May 18, 1934.

## CLASS 4

### ABRASIVES AND POLISHING MATERIALS

SN 8,991. Simonis Company, Chicago, Ill. Filed May 24, 1956.

**DUET**

Owner of Reg. No. 438,985.

For Floor Wax and Cleaner.

First use Nov. 9, 1954.

## CLASS 5

### ADHESIVES

SN 4,016. The Flintkote Company, New York, N. Y. Filed Mar. 7, 1956.

**BONDCOTE**

For Emulsion Type Adhesive.

First use on or about Oct. 15, 1934.

SN 8,889. Stocker Manufacturing Company, Netcong, N. J. Filed May 23, 1956.

**GLASITE**

Owner of Reg. Nos. 529,938, 572,108, and others.

For Gummed Tape.

First use Oct. 18, 1955.

## CLASS 6

### CHEMICALS AND CHEMICAL COMPOSITIONS

SN 676,477. Connecticut Chemical Research Corporation, Bridgeport, Conn. Filed Nov. 12, 1954.

**PINE KING**

For Aerosol Insecticide, Aerosol Deodorant.

First use June 1948.

SN 686,186. Douglas Holt (Est. 1919) Ltd., London, England. Filed Apr. 25, 1955. Sec. 2(f).

**Piston Seal**

For Compound for Coating the Cylinder Walls of Internal Combustion Engines To Compensate for Wear.

First use Mar. 8, 1945; in commerce July 2, 1945.

SN 686,451. Douglas Holt (Est. 1919) Ltd., London, England. Filed Apr. 28, 1955. Sec. 2(f).

The drawing is lined for red and blue. Applicant disclaims the term "Worn Cylinder Compensator" apart from the mark as shown.

For Compound for Coating the Cylinder Walls of Internal Combustion Engines To Compensate for Wear.

First use Mar. 8, 1945; in commerce July 2, 1945.

SN 695,279. Chek Chemical Products Company, Inc., Newark, N. J. Filed Sept. 26, 1955. Sec. 2(f).

**MOTH CHEK**

For Mothproofing Chemical Compound.

First use Nov. 29, 1946.

SN 696,508. Crown Zellerbach Corporation, San Francisco, Calif. Filed Oct. 17, 1955.

Owner of Reg. Nos. 247,311, 601,509, and others.

For Solids of Waste Sulfite Liquor, for Use as a Wetting Agent, Dispersing Agent, Emulsifier, Yeast Nutrient, and Intermediate for the Production of Organic Chemicals.

First use September 1954.

SN 697,013. Paradise Chemical Company, Inc., New York, N. Y. Filed Oct. 24, 1955. Sec. 2(f).

**PARADIZE**

For Insecticides and Mothicides—Namely, Crystals for Killing and Preventing Moths and Compositions for Killing Larvae and Eggs Consisting of Paradichlorobenzene.

First use January 1949.

SN 697,800. L & M Tile Products, Ltd., Dallas, Tex. Filed Nov. 7, 1955.

**POLYCRETE**

For Additive for Strengthening Masonry and Portland Cement.

First use July 22, 1955.

SN 700,344. South African Coal, Oil and Gas Corporation Limited, Sasolburg, Orange Free State, Union of South Africa. Filed Dec. 20, 1955.

## SASOL

Owner of South African Reg. No. 2563/54, dated Nov. 2, 1954.
For Chemical Substances Used in Manufactures, Photography and Anti-Corrosives Such as Hydrocarbons, Hydrocarbons Which Are Semi-Solid or Solid at Normal Temperature, Synthetic Waxes Produced by a Fischer-Tropsch Synthesis, Products of the Oxidation and Other Chemical Conversion of the Aforesaid Products, Also Alcohols, Ketones, Carboxylic Acids, Esters, Aldehydes, Sulfonic Acids, Sulfonates, Sulfonamides, Polyethylene and Other Polyolefins, Phenols and Urea.

SN 700,792. Imperial Chemical Industries Limited, London, England. Filed Dec. 29, 1955.

## LUBROL

Owner of British Reg. No. 730,677, dated May 27, 1954.
For Emulsifying Agents Being Chemical Products Used in Industry.

SN 561. C. H. Boehringer Sohn, Ingelheim am Rhine, Germany. Filed Jan. 12, 1956.

## ALOTEC

Owner of German Reg. No. 855,976, dated Nov. 6, 1954.
For Preparations for Destroying Animals and Plants.

SN 1,723. Ren Plastics, Inc., Lansing, Mich. Filed Jan. 30, 1956.

Ren

For Synthetic Resinous Plastic Materials in the Form of Liquids, Compositions and Hardeners and Curing Agents Therefor.
First use Sept. 19, 1955.

SN 2,800. Mycalex Corporation of America, Clifton, N. J. Filed Feb. 16, 1956.

## SUPRAMICA

Owner of Reg. Nos. 612,109, 625,390, and others.
For Ceramoplastics, i. e. Synthetic Mica Bonded With Glass in Powdered Form.
First use Feb. 8, 1956.

SN 4,689. Alexander Chemical Corp., Chicago, Ill. Filed Mar. 16, 1956.

## D-SOLV

For Water Conditioner in Dry Form Having an Anti-Corrosive Action That Prevents Scale Formation.
First use May 2, 1955.

SN 5,853. La France Manufacturing Co., St. Louis, Mo. Filed Apr. 5, 1956.

## FRANPIC

For Chemical Composition for Use in the Treatment of Ferrous Metals.
First use September 1955.

SN 7,908. Columbian Carbon Company, New York, N. Y. Filed May 8, 1956.

Owner of Reg. Nos. 363,617 and 366,916.
For Carbon Black Having General Utility in the Industrial Arts.
First use Dec. 15, 1955; design of lady holding torch on or about June 8, 1938; design of smoking lamp on or about June 8, 1938.

SN 8,144. National Lead Company, New York, N. Y. Filed May 11, 1956.

## BAROFOS

For Sodium Polyphosphates, Especially Sodium Tetraphosphate.
First use in November 1950.

SN 8,258. Old Colony Paint & Chemical Co., Los Angeles, Calif. Filed May 14, 1956.

Owner of Reg. No. 624,342.
For White Lead, Linseed Oil, Turpentine and Concrete Etching Compound.
First use in 1938.

SN 8,392. E. I. du Pont de Nemours and Company, Wilmington, Del. Filed May 14, 1956.

## LECTON

Owner of Reg. Nos. 603,230 and 605,070.
For Synthetic Resins.
First use on or about Apr. 13, 1956.

SN 8,556. Hyland Laboratories, Los Angeles, Calif. Filed May 18, 1956.

## PRE-MED

For Disposable Petri Dish Containing Blood Agar Culture Medium.
First use Apr. 6, 1956.

SN 8,850. The Hubinger Company, Keokuk, Iowa. Filed May 23, 1956.

## CERIOCA

For Corn Starch for Industrial Purposes.
First use July 6, 1955.

SN 8,851. The Hubinger Company, Keokuk, Iowa. Filed May 23, 1956.

## CERAVA

For Corn Starch for Industrial Purposes.
First use July 6, 1955.

SN 9,028. Devoe & Raynolds Company, Inc., Louisville, Ky. Filed May 25, 1956.

## SYNTEX

Owner of Reg. No. 297,612.
For Synthetic Resins.
First use 1936.

SN 9,029. Devoe & Raynolds Company, Inc., Louisville, Ky. Filed May 25, 1956.

## EPI-TEX

Owner of Reg. No. 532,684.
For Synthetic Resins.
First use Dec. 27, 1947.

SN 9,030. Devoe & Raynolds Company, Inc., Louisville, Ky. Filed May 25, 1956.

## EPI-REZ

Owner of Reg. No. 534,577.
For Synthetic Resins.
First use Apr. 5, 1948.

SN 9,031. Devoe & Raynolds Company, Inc., Louisville, Ky. Filed May 25, 1956.

## STYRETEX

Owner of Reg. No. 536,457.
For Synthetic Resins.
First use Nov. 11, 1949.

SN 9,164. National Lead Company, New York, N. Y. Filed May 28, 1956.

## TRIMULSO

For Emulsifying Agent, Especially for Drilling Muds.
First use Apr. 19, 1956.

SN 9,184. The Sherwin-Williams Company, Cleveland, Ohio. Filed May 28, 1956.

## PERMACHROM

For Pigments.
First use June 1, 1951.

SN 9,378. Lila M. Meade, d. b. a. Meade Products Company, Boston, Mass. Filed May 31, 1956.

## CORRO-SHIELD

For Rust Inhibitive Chemical Coating.
First use on or about Apr. 24, 1956.

SN 9,721. Heliogen Products, Inc., Long Island City, N. Y. Filed June 6, 1956.

## HELIOGEN

Owner of Reg. No. 334,740.
For Disinfectant.
First use Mar. 29, 1956.

SN 10,076. Bradford Chemical Company, Inc., Bradford, Pa. Filed June 12, 1956.

## PERMA-PLUG

For Organic Chemical Compounds for Sealing Off Well Formations.
First use Oct. 23, 1953.

SN 10,344. Retzloff Chemical Company, Almeda, Tex. Filed June 15, 1956.

## SPONTO

For Surface Active Agents for Use as Emulsifying Agents, Detergents, and Demulsifiers.
First use May 1, 1954.

SN 10,391. Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen on Rhine, Germany. Filed June 18, 1956.

## LUGATOL

For Dyestuffs.
First use May 11, 1956.

SN 10,443. Olin Mathieson Chemical Corporation, New York, N. Y. Filed June 18, 1956.

## SCAV-OX

For Hydrazine Solution for the Treatment of Boiler Water.
First use Apr. 12, 1956.

SN 10,450. The Miami Products & Chemical Co., Dayton, Ohio. Filed June 18, 1956.

## HYAGEN

For Combined Wetting and Sanitising Agent.
First use May 1, 1946.

SN 10,466. Pacific Coast Borax Company, Los Angeles, Calif. Filed June 18, 1956.

## FIREBRAKE

For Chemical Composition Used as Fire Retardant Material.
First use May 14, 1956.

### CLASS 9

### EXPLOSIVES, FIREARMS, EQUIPMENTS, AND PROJECTILES

SN 12,261. The Diamond Match Company, New York, N. Y. Filed July 17, 1956.

For Matches.
First use May 15, 1956.

SN 12,908. Southwestern Industrial Electronics Company, Houston, Tex. Filed Aug. 13, 1956.

SN 700,307. The Flintkote Company, New York, N. Y. Filed Dec. 20, 1955.

## FLINTKOTE

For Synthetic Resinous Plastic Materials in the Form of Liquids, Compositions and Hardeners and Curing Agents Therefor.
First use Sept. 19, 1955.

SN 700,344. South African Coal, Oil and Gas Corporation Limited, Sasolburg, Orange Free State, Union of South Africa. Filed Dec. 20, 1955.

## SASOL

Owner of South African Reg. No. 2563/54, dated Nov. 2, 1954.
For Chemical Substances Used in Manufactures, Photography and Anti-Corrosives Such as Hydrocarbons, Hydrocarbons Which Are Semi-Solid or Solid at Normal Temperature, Synthetic Waxes Produced by a Fischer-Tropsch Synthesis, Products of the Oxidation and Other Chemical Conversion of the Aforesaid Products, Also Alcohols, Ketones, Carboxylic Acids, Esters, Aldehydes, Sulfonic Acids, Sulfonates, Sulfonamides, Polyethylene and Other Polyolefins, Phenols and Urea.

SN 700,792. Imperial Chemical Industries Limited, London, England. Filed Dec. 29, 1955.

## LUBROL

Owner of British Reg. No. 730,677, dated May 27, 1954.
For Emulsifying Agents Being Chemical Products Used in Industry.

SN 561. C. H. Boehringer Sohn, Ingelheim am Rhine, Germany. Filed Jan. 12, 1956.

## ALOTEC

Owner of German Reg. No. 855,976, dated Nov. 6, 1954.
For Preparations for Destroying Animals and Plants.

SN 1,723. Ren Plastics, Inc., Lansing, Mich. Filed Jan. 30, 1956.

Ren

For Synthetic Resinous Plastic Materials in the Form of Liquids, Compositions and Hardeners and Curing Agents Therefor.
First use Sept. 19, 1955.

SN 2,800. Mycalex Corporation of America, Clifton, N. J. Filed Feb. 16, 1956.

## SUPRAMICA

Owner of Reg. Nos. 612,109, 625,390, and others.
For Ceramoplastics, i. e. Synthetic Mica Bonded With Glass in Powdered Form.
First use Feb. 8, 1956.

SN 4,689. Alexander Chemical Corp., Chicago, Ill. Filed Mar. 16, 1956.

## D-SOLV

For Water Conditioner in Dry Form Having an Anti-Corrosive Action That Prevents Scale Formation.
First use May 2, 1955.

SN 5,853. La France Manufacturing Co., St. Louis, Mo. Filed Apr. 5, 1956.

## FRANPIC

For Chemical Composition for Use in the Treatment of Ferrous Metals.
First use September 1955.

SN 5,158. Bethlehem Steel Company, Bethlehem, Pa. Filed Mar. 26, 1956.

SN 8,256. Neall Pressed Products Company, San Leandro, Calif. Filed May 14, 1956.

SN 12,906. Southwestern Industrial Electronics Company, Houston, Tex. Filed July 26, 1956.

SIE

For Dynamite Storage Magazines and for Blasters.
First use on or before Feb. 15, 1945, on dynamite storage magazines.

CLASS 10

FERTILIZERS

SN 12,619. W. R. Grace & Co., New York, N. Y. Filed July 23, 1956.

NACONITE

For Fertilizers.
First use June 1, 1956.

SN 13,065. Plantation Fertilizers Corp., Houma, La. Filed July 30, 1956.

Nitra-Mix

For Liquid Fertilizer Solutions of Soil Nutrients and Conditioners Including Nitrogen, Phosphates, and Potash.
First use Aug. 1, 1953.

CLASS 11

INKS AND INKING MATERIALS

SN 12,297. Rochester Ribbon & Carbon Co., Inc., Rochester, N. Y. Filed July 17, 1956.

ORCHID

Owner of Reg. No. 516,152.
For Carbon Paper, Typewriter Ribbons, and Adding Machine Ribbons.
First use July 6, 1947.

CLASS 12

CONSTRUCTION MATERIALS

SN 698,953. Buxton Manufacturing Company, Inc., South Kearny, N. J. Filed Nov. 28, 1955.

MASTERKRAFT

The drawing is lined for brown but no claim is made to color.
For Siding for Walls Made of Compressed Fibers, Metal, Compressed Mineral Granules and Similar Material.
First use Nov. 13, 1953.

SN 700,307. The Flintkote Company, New York, N. Y. Filed Dec. 20, 1955.

Flintcal JFR

Owner of Reg. No. 433,254.
For Compound for Sealing of Expansion or Contraction Joints in Concrete Airport Pavements.
First use on or about Apr. 5, 1950.

SN 700,717. The Dicks-Pontius Company, Dayton, Ohio. Filed Dec. 28, 1955.

DP

Owner of Reg. Nos. 405,683 and 406,929.
For Putty and Glazing Compounds, Caulking Compounds, Rope Caulk, Mastics for Use in Caulking, and Pre-Formed Glazing Strips of Elastomeric Material.
First use on or about Mar. 20, 1934; on or about Feb. 19, 1935, as to "D-P."

SN 2,515. The Eckel Corporation, Cambridge, Mass. Filed Feb. 13, 1956.

ECKOUSTIC

For Panels Formed With Glass Wool or Other Material Between Them for the Absorption and Reduction of Sound.
First use on or about Dec. 15, 1955.

SN 3,224. Pro-Tect-U Awning-Shutter Corporation, Miami, Fla. Filed Feb. 23, 1956.

PRO-TECT-U

For Wood, Metal, and Composition Awning Shutters.
First use Sept. 30, 1926.

SN 3,507. Air Master Corporation, Philadelphia, Pa. Filed Feb. 28, 1956.

PIVOT-MASTER

For Combination Storm and Screen Windows.
First use Jan. 9, 1956.

SN 5,099. Insul-Mastic Laboratories, Inc., Summit, Ill. Filed Mar. 23, 1956.

INSUL-WHITE

For Roof and Sidewall Mastic Coating Essentially Comprising a Plasticised High Styrene-Butadiene Binder, Titanium Pigment, and Mica.
First use Feb. 6, 1956.

SN 5,158. Bethlehem Steel Company, Bethlehem, Pa. Filed Mar. 26, 1956.

BETHLEHEM SLAB FORM

The words "Slab Form" are disclaimed apart from the mark.
Owner of Reg. No. 171,606.
For Corrugated Steel Sheets.
First use Feb. 29, 1956.

SN 5,248. Steel Door Corporation, Birmingham, Mich. Filed Mar. 26, 1956.

FLOATAWAY

For Steel Folding Doors for Closets and the Like.
First use Feb. 10, 1956.

SN 5,315. Midwest Jobbers, Inc., Chicago, Ill. Filed Mar. 27, 1956.

REDI-TRIM

For Wood Trim—Namely, Wood Mouldings and Wood Window and Door Trim.
First use Mar. 19, 1956.

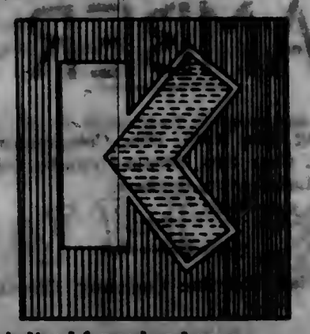
SN 5,445. National Gypsum Company, Buffalo, N. Y. Filed Mar. 29, 1956.

CHROMA-TONE

For Asbestos-Cement Siding Shingles.
First use May 24, 1955.

SN 5,810. ARB Window Sales Company, Detroit, Mich. Filed Apr. 5, 1956.

ARB



For Horizontal and Vertical Metal Windows.
First use Aug. 16, 1950.

SN 5,837. Harbison-Walker Refractories Company, Pittsburgh, Pa. Filed Apr. 5, 1956.

H-W KALA

Owner of Reg. Nos. 221,923 and 564,919.
For Fire Brick.
First use Apr. 4, 1937.

SN 6,258. Kessler Products Co., Inc., Youngstown, Ohio. Filed Apr. 12, 1956.

The drawing is lined for red and gray.
For Construction Materials, Chiefly of Plastics, Such as Glass-Fiber Reinforced Plastic Panels, Plastic Weatherstripping, Plastic Screen Spline, Window Tracks, Etc.
First use 1950.

SN 8,256. Neall Pressed Products Company, San Leandro, Calif. Filed May 14, 1956.

Cedarcraft

For Pressed Board Panels Made of Wood Chips Bonded Together by Resin.
First use Jan. 26, 1956.

SN 8,569. Donald R. Munro, Jr., d. b. a. D. R. Munro & Son Company, Portland, Oreg. Filed May 18, 1956.

GRIPAC

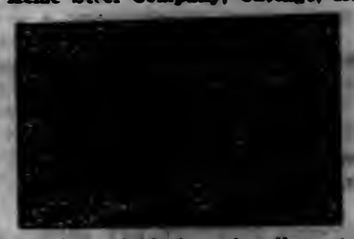
For Panel Forming Members.
First use Feb. 28, 1956.

CLASS 13

HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

SN 694,373. Hedeman Products, Incorporated, Great Neck, N. Y. Filed Sept. 8, 1955.

POLYFLOW



For Flexible Tubing for Transmission of Fluids.
First use Aug. 18, 1955.
Subj. to Intf. with SN 11,084.

SN 11,084. The Imperial Brass Manufacturing Company, Chicago, Ill. Filed June 27, 1956.

POLY-FLO

For Fittings for Use With Plastic Tubing.
First use October 1953.
Subj. to Intf. with SN 694,373.

SN 11,214. Acme Steel Company, Chicago, Ill. Filed June 29, 1956.

The mark consists of black and yellow stripes with the letters "UL" on black stripes and the words "Acme Steel" on a black background.
For Metal Strap Fastening Seals.
First use Jan. 5, 1953.

SN 11,321. Acme Steel Company, Chicago, Ill. Filed July 2, 1956.

The mark consists of black and yellow stripes with the letters "ULX" on black stripes and the words "Acme Steel" on a black background.
For Metal Strap Fastening Seals.
First use Feb. 11, 1956.

SN 11,426. Stockham Valves & Fittings, Inc., Birmingham, Ala. Filed June 29, 1956.

STOCKHAM

For Valves and Fittings.
First use Apr. 1, 1956.

SN 11,427. Stockham Valves & Fittings, Inc., Birmingham, Ala. Filed June 29, 1956.

STOCKHAM

For Valves and Fittings.
First use Apr. 1, 1956.

SN 11,428. Stockham Valves & Fittings, Inc., Birmingham, Ala. Filed June 29, 1956.

STOCKHAM

For Valves and Fittings.
First use Apr. 1, 1956.

SN 11,429. Stockham Valves & Fittings, Inc., Birmingham, Ala. Filed June 29, 1956.

STOCKHAM

For Valves and Fittings.
First use Apr. 1, 1956.

SN 11,430. Stockham Valves & Fittings, Inc., Birmingham, Ala. Filed June 29, 1956.

STOCKHAM

For Valves and Fittings.
First use Apr. 1, 1956.

For Valves and Fittings.
First use Apr. 1, 1956.

SN 11,591. Stockham Valves & Fittings, In

SN 11,428. Stockham Valves & Fittings, Inc., Birmingham, Ala. Filed July 2, 1956. Sec. 2(f).

**STOCKHAM**

For Valves and Pipe Fittings.
First use Jan. 1, 1923, on pipe fittings.

SN 11,561. Elkhart Brass Manufacturing Company, Inc., Elkhart, Ind. Filed July 5, 1956.

**TRI-LOC**

For Holders for Hose Nozzles and More Particularly for Holders for Fire Hose Nozzles.
First use Sept. 30, 1946.

SN 11,608. The Premier Autoware Company, Cleveland, Ohio. Filed July 5, 1956.

**HI-TRONIC**

For Threaded Fasteners—Namely, Cap Screws.
First use May 24, 1956.

SN 11,627. Speakman Company, Wilmington, Del. Filed July 5, 1956.

**UNI-MIX**

For Sink Faucets Equipped With Mixing Valves, Some of Which Faucets Are Also Equipped With Hoses, Sprays, and/or Soap Dishes.
First use Feb. 28, 1956.

SN 11,792. Precision Machine Products, Alameda, Calif. Filed July 9, 1956.

**FASTITE**

For Self-Drilling Expansion Shells.
First use Aug. 8, 1955.

SN 11,881. Stratoflex, Inc., Fort Worth, Tex. Filed July 10, 1956.

**STRATOGRIP**

For Metal Hose Fittings.
First use Mar. 22, 1956.

SN 12,041. Robert R. McKenzie, d. b. a. R. R. McKenzie Company, Sun Valley, Calif. Filed July 12, 1956. Sec. 2(f).

**SPIKE-AID**

Owner of Reg. No. 527,395.
For Golf Shoe Spike Plates, and Wrenches Therefor.
First use Jan. 1, 1946.

SN 12,219. Remington Arms Company, Inc., Bridgeport, Conn. Filed July 16, 1956. Sec. 2(f).

**Remington**

Owner of Reg. Nos. 187,871 and 585,910.
For Fastening Devices—Namely, Studs, Pins, and Bolts Adapted To Be Driven by the Combustion of a Propellent Charge.
First use on or about Mar. 28, 1951, on studs.

## CLASS 14

## METALS AND METAL CASTINGS AND FORGINGS

SN 9,322. H. Kramer and Company, Chicago, Ill. Filed May 9, 1956. Sec. 2(f).

For Metal Ingots, Castings, and Other Basic Metallic Shapes and Forms.
First use on or about July 1, 1881.

SN 14,609. H. Kramer and Company, Chicago, Ill. Filed May 9, 1956.

**AJAX**

For Metal Ingots, Castings, and Other Basic Metallic Shapes and Forms.
First use July 1, 1880.

## CLASS 15

## OILS AND GREASES

SN 698,568. Amber Lubricants Co., Long Beach, Calif. Filed Nov. 21, 1955.

**AMBER**

For Lubricating Oils, Motor Oils, Compressor Oils, Soluble and Cutting Oils, Gear Oils, Steam Cylinder Oils, Valve Oils, Diesel Fuel, and Lubricating Greases.
First use in the year 1930.

SN 15,149. Sinclair Refining Company, Chicago, Ill. Filed Sept. 5, 1956.

**LIKUT**

For Cutting Oil.
First use Aug. 6, 1956.

## CLASS 16

## PROTECTIVE AND DECORATIVE COATINGS

SN 698,859. General Paint Corporation, San Francisco, Calif. Filed Nov. 23, 1955.

The drawing is lined for yellow. Owner of Reg. Nos. 281,160 and 408,462.
For Ready-Mixed Paints, Paint Enamels, Lacquers, Varnishes, Primers, Sealers, Tinting Colors, Stains, and Thinners.
First use January 1954.

SN 5,669. The Proko Company, Dallas, Tex. Filed Apr. 2, 1956.

**TRIKO PRODUCTS**

The word "Products" is disclaimed apart from the mark as shown.
For Paint.
First use Dec. 21, 1955.

SN 7,693. Pittsburgh Plate Glass Company, Pittsburgh, Pa. Filed May 4, 1956.

**DURETHANE**

For Polyurethane Coatings and Finishes.
First use Mar. 31, 1956.

SN 9,066. Willen Chemical Co., Odenton, Md. Filed May 25, 1956.

**PERMATRED**

For Floor Paint.
First use May 17, 1956.

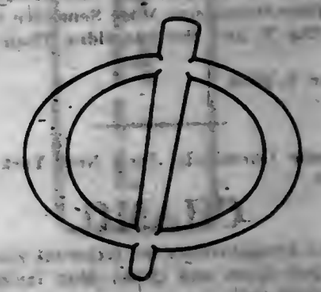
SN 10,061. R. M. Hollingshead Corporation, Camden, N. J. Filed May 15, 1956.

**WHIZ**

Owner of Reg. Nos. 221,399, 565,465, and others.
For Japan Iron-Enamel, Touch-Up Enamel for Automobiles, Ready-Mixed Liquid Tire Cover Paint, Varnish, and Ready-Mixed Shellac.
First use Sept. 1, 1905.

TM 713 O. G.—6

## CLASS 18



## MEDICINES AND PHARMACEUTICAL PREPARATIONS

SN 682,697. Amber Laboratories, Inc., Milwaukee, Wis. Filed Mar. 3, 1955.

**QUAFF-AID**

For Tablets Containing Vitamin B and Thiamin for Discomfort Due to Over-Consumption of Alcohol.
First use Feb. 14, 1955.

SN 693,246. Charles E. Frosst & Co., Montreal, Quebec, Canada. Filed Aug. 17, 1955.

The mark is a representation of the Greek letter "Phi."
Owner of Reg. No. 345,021.
For Pharmaceutical Preparations in the Form of Medicinal Tablets Containing Vitamins, Hormones, Analgesics, Sedatives, Antacids, Anticoagulants, Antibiotics, Cardiac Stimulants, and Anti-Thyroid or Anti-Bacterial Substances.
First use Sept. 26, 1940; in commerce Mar. 10, 1952.

SN 693,482. Ortho Pharmaceutical Corporation, Raritan, N. J. Filed Aug. 22, 1955.

**MASSÉ**

Owner of Reg. No. 570,905.
For Pharmaceutical Cream With Bacteriostatic and Anti-Fungal Qualities.
First use Jan. 31, 1950.

SN 7,403. Ward & Stalnaker, Riverside, Calif. Filed Apr. 30, 1956.

**W & S**

For Balanced Protein Food Supplement in Tablet and Capsule Form for Human Use.
First use Jan. 15, 1956.

SN 11,428. Stockham Valves & Fittings, Inc., Birmingham, Ala. Filed July 2, 1956. Sec. 2(f).

**STOCKHAM**

For Valves and Pipe Fittings.
First use Jan. 1, 1923, on pipe fittings.

SN 11,561. Elkhart Brass Manufacturing Company, Inc., Elkhart, Ind. Filed July 5, 1956.

**TRI-LOC**

For Holders for Hose Nozzles and More Particularly for Holders for Fire Hose Nozzles.
First use Sept. 30, 1946.

For Balanced Protein Food Supplement in Tablet and Capsule Form for Human Use.
First use Jan. 15, 1956.

SN 7,404. Ward & Stalnaker, Riverside, Calif. Filed Apr. 30, 1956.

Applicant disclaims the term "Protein 90" apart from the mark as shown.

For Balanced Protein Food Supplement in Tablet and Capsule Form for Human Use.
First use Jan. 15, 1956.

SN 7,517. Eli Lilly and Company, Indianapolis, Ind. Filed May 2, 1956.

## V-CILLIN-SULFA

No claim is made to the word "Sulfa" apart from the mark. Owner of Reg. Nos. 523,793, 524,119, and 633,060.

For Medicinal Preparation of Penicillin V With Triple Sulfonamides, for the Prophylaxis and Treatment of Infections Due to Micro-Organisms More Sensitive to the Combination of Penicillin V and Sulfonamides Than to Either One Alone.
First use Mar. 5, 1956.

SN 8,751. Dome Chemicals, Inc., New York, N. Y. Filed May 22, 1956.

## CHAMO

For Medicinal Preparations for External Use in the Treatment of Skin Infections and Other Skin Irritations.
First use in April 1954.

SN 8,755. Dome Chemicals, Inc., New York, N. Y. Filed May 22, 1956.

## DOMICONE

For Medicinal Preparations for External Use in the Treatment of Skin Infections and Other Skin Irritations.
First use November 1954.

SN 8,999. The Upjohn Company, Kalamazoo, Mich. Filed May 24, 1956.

## INDILONE

For Preparation for the Treatment of Cardiovascular Disease.
First use Dec. 9, 1955.

SN 9,000. The Upjohn Company, Kalamazoo, Mich. Filed May 24, 1956.

## ALBIOTIC

For Antibiotic Preparation.
First use Jan. 18, 1956.

SN 9,003. The Upjohn Company, Kalamazoo, Mich. Filed May 24, 1956.

## ALBADROPS

For Antibiotic Preparation.
First use Jan. 18, 1956.

SN 9,004. The Upjohn Company, Kalamazoo, Mich. Filed May 24, 1956.

## ALBAGUENT

For Antibiotic Preparation.
First use Jan. 18, 1956.

SN 9,311. Wallace & Tiernan Incorporated, Belleville, N. J. Filed May 29, 1956.

## BIFRAN

For Preparation Used in Treatment for Obesity.
First use Apr. 16, 1954.

SN 9,312. Wallace & Tiernan Incorporated, Belleville, N. J. Filed May 29, 1956.

## MALCODEX

For Antibiotic Nasal Decongestant.
First use Sept. 16, 1948.

SN 9,336. Burroughs Wellcome & Co. (U. S. A.) Inc., Tuckahoe, N. Y. Filed May 31, 1956.

## CODALONE

For Analgesic Drug.
First use May 8, 1956.

SN 9,353. Flint, Eaton and Company, Decatur, Ill. Filed May 31, 1956.

## URONAMIDE

For Urinary Antiseptic for Combating Infection in the Genito-Urinary Tract.
First use Jan. 15, 1956.

SN 9,386. Chas. Pfizer & Co., Inc., Brooklyn, N. Y. Filed May 31, 1956.

## BONOMYCIN

For Antibiotic Preparation.
First use May 18, 1956.

SN 9,387. Chas. Pfizer & Co., Inc., Brooklyn, N. Y. Filed May 31, 1956.

## COMBIOSYN

For Antibiotic Preparation.
First use May 18, 1956.

SN 9,388. Chas. Pfizer & Co., Inc., Brooklyn, N. Y. Filed May 31, 1956.

## HETEROMYCIN

For Antibiotic Preparation.
First use May 18, 1956.

SN 9,389. Chas. Pfizer & Co., Inc., Brooklyn, N. Y. Filed May 31, 1956.

## SIGNAMYCIN

For Antibiotic Preparation.
First use May 18, 1956.

SN 9,536. Thos. Leeming & Co., Inc., New York, N. Y. Filed June 4, 1956.

## Piperazate

For Anthelmintic Preparation.
First use Feb. 27, 1956.

SN 9,584. The Paul Plessner Company, Detroit, Mich. Filed June 4, 1956.

## Azodettes

For Urinary Tract Antibacterial Analgesic.
First use May 4, 1956.

SN 9,651. Larx Pharmatetic Corp., New York, N. Y. Filed June 5, 1956.

## ANDERIN

For Tablets for the Relief of Pain Due to Headache, Neuralgia, Muscular Irritation, Etc.
First use Jan. 13, 1956.

SN 9,652. Lovens Kemiske Fabrik ved A. Kongsted, Copenhagen, Denmark. Filed June 5, 1956.

## GONADOPLEX

Owner of Danish Reg. No. 23—1940, dated Jan. 13, 1940.

For Hormone Preparations.

SN 9,725. Interstate Chemical Co., West Trenton, N. J. Filed June 6, 1956.

## INJECTO-BIOTIC

For Medicinal Preparation for Veterinary Use in the Treatment of Mastitis.
First use Dec. 1, 1955.

SN 10,253. Parlam Corporation, New York, N. Y. Filed June 14, 1956.

## TAMINALS

For Preparation To Enhance Metabolic Conditions and More Specifically a Vitamin and Mineral Preparation.
First use in the first half of November 1953.

SN 10,377. Abbott Laboratories, North Chicago, Ill. Filed June 18, 1956.

## SPONTIN

For Antibiotic Preparation.
First use May 7, 1956.

### CLASS 19
### VEHICLES

SN 648,763. Cletus A. Klein, d. b. a. Caro Manufacturing Co., Caro, Mich. Filed June 15, 1953.

MINUTE BOY TOW-PILOT

No exclusive claim is made to the word "Tow" and the representation of the tow-bar apart from the mark shown.

For Tow Bars.
First use June 9, 1953.

SN 700,640. Neptuna Corporation, Los Angeles, Calif. Filed Dec. 27, 1955.

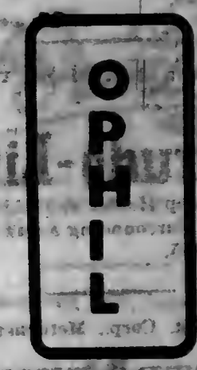
## Boatmobile

For Floating Trailer, Floating on Water and Riding While on Land as an Ordinary Land House Trailer.
First use Dec. 1, 1955.

SN 7,770. Copco Trailer Division, a division of Copco Steel and Engineering Company, Centerline, Mich. Filed May 7, 1956.

## COPCO

For Tractor-Hauled Trailers, of Either Van, Open, or Flat Platform Types.
First use Apr. 30, 1956.



SN 10,302. Crane Carrier Corporation, Tulsa, Okla. Filed June 15, 1956.

## "MIXER-MASTER"

For Trucks Used To Haul Ready-Mixed Concrete Mixers.
First use Oct. 1, 1955.

### CLASS 21
### ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

SN 660,222. O. Philipp & Company, Inc., New York, N. Y. Filed Jan. 27, 1954.

For Power Plant Comprising Electrical and Mechanical Components, for Generating Power for Industrial Application.
First use July 29, 1953.

SN 668,476. States Batteries, Inc., Los Angeles, Calif., to Atlas Supply Company, Newark, N. J. Filed June 18, 1954.

## PERMA-FUL

Owner of Reg. No. 389,485.

For Storage Batteries.
First use May 6, 1947.

SN 681,862. Magnatran Incorporated, Kearny, N. J. Filed Feb. 17, 1955. Sec. 2(f).

For Electrical Equipment—Namely, Transformers and Reactors.
First use June 24, 1954.

SN 689,503. Julian A. McDermott Corp., Corona, N. Y. Filed June 14, 1955.

MULTI-PULSE

For Electrically Operated Warning Lights.
First use Jan. 2, 1955.

SN 332. William E. Harrison, New York, N. Y. Filed Jan. 9, 1956.

HYDR⊙TOR

For Antennas, Antenna Control Mechanisms and Systems or Parts Thereof.
First use Oct. 1, 1955.

SN 2,321. Trade Distributors, Inc., New York, N. Y. Filed Feb. 8, 1956.

EMPIRE

For Radio Receiving Sets.
First use Jan. 4, 1956.

SN 2,999. Magni-Flood, Inc., Mount Vernon, N. Y. Filed Feb. 20, 1956.

Extrude-Lite

For Island Area Lamp Holder and Light Used for Lighting the Pump Islands and Surrounding Areas at Gasoline Stations.
First use Oct. 10, 1955.

SN 5,771. Guiton Mfg. Corp., Metuchen, N. J. Filed Apr. 4, 1956.

ELECTRO-SENTRY

For Visible and Audible Alarm Systems for Homes, Stores, Factories, Warehouses, Other Buildings and Their Surrounding Areas Which Are Actuated by the Motion of Persons, Vehicles, Animals, Etc.
First use Mar. 3, 1956.
Subj. to Intf. with S. N. 10,448.

SN 7,956. Transitron Electronic Corporation, Melrose, Mass. Filed May 8, 1956.

SILIMAT

For Semi-Conductor Materials, Diodes, Transistors, and Rectifiers.
First use Apr. 24, 1956.

SN 8,729. Ungar Electric Tools, Inc., Los Angeles, Calif. Filed May 21, 1956. Sec. 2(f).

Ungar

Owner of Reg. No. 327,053.
For Electric Burning Pencils, Electric Soldering Iron, Electric Soldering Iron Tips and Electric Heating Units for Electric Burning Pencils.
First use Nov. 2, 1948, on electric heating units.

SN 9,421. Airtron, Inc., Linden, N. J. Filed June 1, 1956. Owner of Reg. Nos. 439,244 and 528,389.

COAXAGUIDE

For Flexible and Rigid Coaxial Waveguide Used in Microwave Plumbing Systems To Channel Electrical Energy From One Point to Another.
First use Apr. 15, 1956.

SN 10,448. Louis J. McManamee, d. b. a. Columbia Electric Mfg. Co., East St. Louis, Ill. Filed June 18, 1956.

For Burglar Alarm for Automobiles.
First use on or before May 1, 1949.
Subj. to Intf. with SN 5,771.

SN 10,471. Peterson Manufacturing Company, Inc., Kansas City, Mo., to Ratliff Construction Co., Kansas City, Mo. Filed June 18, 1956.

BIG PETE

For Vehicle Lamps.
First use Apr. 1, 1949.

SN 10,798. Piggly Wiggly Corporation, Jacksonville, Fla. Filed June 22, 1956.

PLYMOUTH

For Light Bulbs.
First use Feb. 1, 1955.

SN 10,873. General Electric Company, Auburn, N. Y. Filed June 25, 1956.

THRU-CON

For Printed Circuit Boards for Use in Electronic Equipment.
First use Oct. 22, 1954.

SN 11,163. The Filtron Company Inc., Flushing, N. Y. Filed June 28, 1956.

FIL-CAP

For Radio Interference Suppression Filter Capacitors.
First use Mar. 1, 1956.

SN 11,271. P. R. Mallory & Co., Inc., Indianapolis, Ind. Filed June 29, 1956.

SOLIDION

For Dry Batteries.
First use Dec. 28, 1954.

SN 11,372. Hughes Aircraft Company, Culver City, Calif. Filed July 2, 1956.

MEMOTRON

Owner of Reg. No. 601,594.
For Cathode Ray Tubes.
First use on or about Nov. 18, 1953.

SN 11,569. The A. C. Gilbert Company, New Haven, Conn. Filed July 5, 1956. Sec. 2(f).

GILBERT

Owner of Reg. Nos. 137,237, 301,576, and 881,145.
For Household Electric Appliances for Preparing Food—Namely, Food Mixers and Food Cookers.
First use July 1, 1913, on food mixers.

SN 11,730. Adalet Manufacturing Company, Cleveland, Ohio. Filed July 9, 1956.

PEGI

For Insulating Bushings.
First use July 5, 1955.

SN 11,731. Adalet Manufacturing Company, Cleveland, Ohio. Filed July 9, 1956.

SKY-TIE

For Cable Clamps.
First use March 1952.

SN 11,732. Adalet Manufacturing Company, Cleveland, Ohio. Filed July 9, 1956.

SALI

For Insulating Bushings.
First use June 1944.

CLASS 22

GAMES, TOYS, AND SPORTING GOODS

SN 693,716. Louis Johnson Company, Highland Park, Ill. Filed Aug. 24, 1955. Sec. 2(f).

JOHNSON'S SILVER MINNOW

Owner of Reg. No. 328,437.
For Artificial Fish Lures.
First use 1923.

SN 10,071. Norbert Aubin, d. b. a. Aubin Enterprises, Inglewood, Calif. Filed June 12, 1956.

Chee-Ki

For Toys, in the Shapes of Various Animals.
First use Apr. 15, 1956.

SN 10,906. Eddie Pope, d. b. a. Eddie Pope & Co., Altadena, Calif. Filed June 25, 1956.

HOT SHOT

For Artificial Fish Lures.
First use Feb. 14, 1948.

SN 11,039. The Seamless Rubber Company, New Haven, Conn. Filed June 26, 1956.

HERCULES

For Rubber Covered Basketballs.
First use Jan. 10, 1950.

SN 11,323. Aktiebolaget Urfabriken, Svangsta, Sweden. Filed July 2, 1956.

Ambassadeur

For Fishing Reels.
First use in August 1952.

CLASS 23

CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

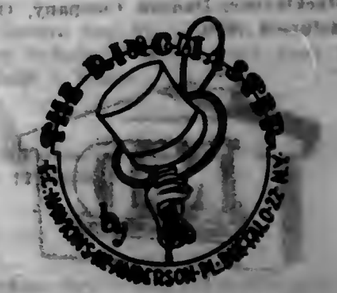
SN 690,354. West End Iron Works, Albany, N. Y. Filed June 27, 1955.

Formit

For Scroll Forming Dies and Pre-Shaped Iron Bars and Wire for Forming Decorative and Ornamental Iron Work.
First use Apr. 11, 1955.

SN 1,281. Binn Conveyors, Inc., Lapeer, Mich. Filed Jan. 23, 1956.

Calveyor



For Endless Belt Conveyors and Parts Therefor.
First use Apr. 13, 1955.

SN 1,438. Hammond Machinery Builders, Inc., Kalamazoo, Mich. Filed Jan. 25, 1956. Sec. 2(f).

DUSKOLECTOR

For Dust Collectors.
First use in the year 1942.

SN 3,185. Earl C. Hawkins, Buffalo, N. Y. Filed Feb. 23, 1956.

For Hand Tool for Making Packing Rings for Stuffing Boxes.
First use June 6, 1952.

SN 6,767. Tech-Art Plastics Company, Morristown, N. J. Filed Apr. 19, 1956.

BB

For Steel Molds Used in Producing Molded Plastic Items.
First use in 1912.

SN 7,451. National Engineering Company, Chicago, Ill. Filed May 1, 1956.

SCREEN MASTER

For Vibrating Screen and Magnetic Separator for Screening Dry Materials.
First use Apr. 11, 1956.

SN 7,452. National Engineering Company, Chicago, Ill. Filed May 1, 1956.

MOLDER'S HELPER

The drawing is lined for green.
For Elevating Aerator for Sand.
First use Apr. 11, 1956.

SN 9,746. Scott-Atwater Manufacturing Company, Minneapolis, Minn. Filed June 6, 1956.

Bail-a-matic

For Outboard Motors and Boat Bailing Attachments Therefor.
First use Dec. 31, 1953.

SN 9,858. Globe Hoist Company, Des Moines, Iowa. Filed June 8, 1956.

TRANS-O-MATIC

For Dock Leveling Ramps.
First use on or about Apr. 13, 1956.

SN 9,878. Macklanburg-Duncan Company, Oklahoma City, Okla. Filed June 8, 1956.

M-D

Owner of Reg. No. 284,457.
For Caulking Guns.
First use April 1956.

SN 9,894. Ribbon Copies Sales Corp. of America, Cleveland, Ohio. Filed June 8, 1956.

RIBCO-TYPER

For Typewriter Attachment.
First use May 25, 1956.

SN 10,097. National Automotive Parts Association, Detroit, Mich. Filed June 11, 1956. COLLECTIVE MARK.

FLEET

For Mechanical and Hydraulic Jacks.
First use Oct. 25, 1954.

SN 10,079. Allen A. Burleson, Dallas, Tex. Filed June 12, 1956.

NIF-T-VEN

For Coin-Actuated Vending Machines for Vending Notebook Paper, Magazines, and Similarly Packaged Paper Sheets.
First use Jan. 1, 1956.

SN 10,101. Peters & Russell, Inc., Springfield, Ohio. Filed June 12, 1956.

Little Sucker

For Liquid Pumps.
First use Oct. 7, 1955.

SN 10,449. W. F. Meyers Company, Inc., Bedford, Ind. Filed June 18, 1956.

MAINLINE

For Circular Saws.
First use May 7, 1956.

SN 10,553. Red Jacket Manufacturing Co., Davenport, Iowa. Filed June 19, 1956.

EXTRACTA

For Pumping Systems and Apparatus for Pumping Motor Fuel Such as Gasoline, Including Remote Control Motor Driven Pump Unit, Control Box, Discharge Manifold, Riser Pipe and Flange Assembly, Manhole Covers and the Like All Adapted for Assembly in a Unit To Pump Fuel From a Remote Storage Tank to a Dispensing Pedestal.
First use on about Apr. 18, 1956.

SN 10,605. Knit-King Corporation, New York, N. Y. Filed June 20, 1956.

RIBMASTER

For Hand Knitting Machines.
First use Nov. 30, 1955.

SN 11,528. Auto Specialties Manufacturing Co., St. Joseph, Mich. Filed July 5, 1956.

AUSCO

Owner of Reg. Nos. 357,670, 373,135, and 411,188.
For Clutches.
First use on or about Mar. 9, 1956.

SN 11,623. Seaman-Andwall Corporation, Milwaukee, Wis. Filed July 5, 1956.

PULVI-MIXER

Owner of Reg. No. 401,466.
For Road Mixing and Stabilizing Machines and Parts Thereof—Namely, Tractors, Mixing Chambers, Rotors, Tines, Hydraulic Systems, Power Steering Systems, and Underbody Scarifiers.
First use in or about July 1939.

## CLASS 26

## MEASURING AND SCIENTIFIC APPLIANCES

SN 691,489. Marshfield Manufacturing Corporation, Long Island City, N. Y. Filed July 18, 1955.

Liqua-matic

For Dispensers With Automatic Timing Devices for Attachment to Clothes Washing and Dry Cleaning Machines for Automatically Dispensing Measured Quantities of Liquid Chemicals and Detergents Used in Laundering and Dry Cleaning Operations.
First use Apr. 27, 1955.

SN 693,949. Sullivan Valve and Engineering Company, Butte, Mont. Filed Aug. 30, 1955.

Adjusta-trol

For Temperature Responsive Controls for Regulating the Fluid Heating Medium of Home Heating Systems in Accordance With Variations in Temperature of the Outside Air.
First use Feb. 1, 1955.

SN 2,073. B-I-F Industries, Inc., Providence, R. I. Filed Feb. 6, 1956.

SENS-A-GRAM

For Mechanical Controller for Producing Corrective Action in Feeding Mechanisms.
First use Dec. 12, 1955.

SN 7,415. Barbour-Stockwell Company, Cambridge, Mass. Filed May 1, 1956. Sec. 2(f).

MILEMASTER

For Odometers.
First use February 1949.

SN 7,467. Allen Electric and Equipment Company, Kalamazoo, Mich. Filed May 2, 1956.

DISTRIBUTRON

For Apparatus for Testing Ignition System of an Internal Combustion Engine.
First use Apr. 11, 1956.

SN 7,468. Allen Electric and Equipment Company, Kalamazoo, Mich. Filed May 2, 1956.

SAFTI-SEAL

For Compression Tester.
First use Apr. 5, 1956.

## CLASS 32

## FURNITURE AND UPHOLSTERY

SN 3,778. Super-Foam Company, Brooklyn, N. Y. Filed Mar. 2, 1956. Sec. 2(f).

Super-Foam

Owner of Reg. No. 532,595.
For Upholstery Cushioning, Mattresses and Bedding, Pillows, Seat Pads, Headrests, Footrests, Arm Rests.
First use Feb. 3, 1948.

SN 13,656. Eriksen & Hutchins, Wilmington, Del. Filed Aug. 9, 1956.

TOT BOX

For Chair for Infants.
First use Aug. 19, 1955.

SN 13,753. Futorian Manufacturing Co., d. b. a. Stratosleeper, Chicago, Ill. Filed Aug. 10, 1956.

STRATOSLEEPER

For Sofa Which Is Convertible Into a Bed.
First use Feb. 27, 1956.

## CLASS 34

## HEATING, LIGHTING, AND VENTILATING APPARATUS

SN 685,373. Dr. Bruno Gueggi, d. b. a. Etablissement Alustra, Vaduz, Liechtenstein. Filed Apr. 12, 1955.

STRAMAX

Owner of Liechtenstein Reg. No. 404, dated May 13, 1954.
For Central Heating Systems, Radiation Heaters and Registers.

SN 698,657. Steels Engineering Installations Limited, Sunderland, England. Filed Nov. 21, 1955.

ALACOIL

Owner of British Reg. No. 742,844, dated May 31, 1955.
For Coiled Tubular Non-Electrical Heat Exchangers for Heating Liquids in Tanks.

SN 6,557. Richmond Engineering Co., Inc., Richmond, Va. Filed Apr. 17, 1956.

RECO

Owner of Reg. Nos. 179,664, 581,557, and 607,262.
For Storage Heaters, Converters, Instantaneous Heaters, Heat Reclaimers, and Process Heat Exchangers.
First use Dec. 31, 1936.

SN 11,681. Holyoke Heater Corp. of Conn., Inc., Hartford, Conn. Filed July 6, 1956.

The drawing is lined for red.
For Hot Water Heaters.
First use at least as early as 1916.

CLASS 35

BELTING, HOSE, MACHINERY PACKING, AND NONMETALLIC TIRES

SN 9,757. The S. K. Wellman Co., Bedford, Ohio. Filed June 6, 1956.

FERAMIC

For Friction Material for Clutch and Brake and Transmission Linings and Facings.
First use Apr. 16, 1956, on clutch plate facings.

SN 10,566. United States Rubber Company, New York, N. Y. Filed June 19, 1956.

U. S. ROYAL MASTER

Owner of Reg. Nos. 270,155, 606,730, and 606,732.
For Rubber Tires and Inner Tubes for Vehicles.
First use on or about Mar. 1, 1936.

SN 10,763. Dunlop Tire and Rubber Corporation, Buffalo, N. Y. Filed June 22, 1956.

MONOCORD

For Tires.
First use May 18, 1956.

SN 10,764. Dunlop Tire and Rubber Corporation, Buffalo, N. Y. Filed June 22, 1956.

MONOCABLE

For Tires.
First use May 18, 1956.

CLASS 36

MUSICAL INSTRUMENTS AND SUPPLIES

SN 7,645. Henry Teller & Son, Chicago, Ill. Filed May 3, 1956.

TELLENO

For Musical Instruments Including Trumpets, Cornets, Trombones, Clarinets, Saxophones, Flutes, Piccolos, French Horns, Sousophones, and Bell Front Alto Horns and Accessories Including Ring Over Band Covers, Spiral Bound Covers, Sheet Music Covers and Octavo Covers.
First use Jan. 1, 1954.

CLASS 37

PAPER AND STATIONERY

SN 697,138. Azon Corporation, Binghamton, N. Y. Filed Oct. 26, 1955.

AZON

For Tracing Paper.
First use March 1950.

SN 698,160. George D. German, Stillwater, Minn. Filed Nov. 14, 1955.

WONHAN

For One Handed Pen or Pencil Clip.
First use June 1, 1947.

SN 5,663. Orientex, Ltd., New York, N. Y. Filed Apr. 2, 1956.
For Wall Paper.

KKK

First use Sept. 6, 1950.

SN 9,982. A. C. Hummel Company, Cincinnati, Ohio. Filed June 11, 1956.

HANDIBOY

For All Purpose Moistener for Labels, Envelope Flaps, Stamps, and the Like.
First use Apr. 27, 1956.

SN 10,054. The Wrenn Paper Company, Middletown, Ohio, to The Sorg Paper Company, Middletown, Ohio. Filed June 11, 1956.

RECORD

Owner of Reg. No. 236,127.
For Blotting Paper.
First use in or about 1908.

SN 10,055. The Wrenn Paper Company, Middletown, Ohio, to The Sorg Paper Company, Middletown, Ohio. Filed June 11, 1956.

ROYAL COLORS

Owner of Reg. No. 237,556.
For Blotting Paper.
First use on or about 1908.

CLASS 38

PRINTS AND PUBLICATIONS

SN 700,372. Creative Specialties, Inc., New York, N. Y. Filed Dec. 21, 1955.

DIAL-A-DIET

For Rotary Charts for Use in the Tabulation of Calorie Values of Foods.
First use Oct. 21, 1955.

SN 6,510. The Evening Star Newspaper Company of Washington, Washington, D. C. Filed Apr. 17, 1956.

The Sunday Star TV GUIDE

Owner of Reg. No. 66,508.
For Weekly (Sunday) Television Magazine.
First use Mar. 25, 1956.

CLASS 39

CLOTHING

SN 10,573. The Associated Merchandising Corporation, New York, N. Y. Filed June 20, 1956. Sec. 2(f).

Toe-rite

For Children's Shoes Made Wholly or in Part of Leather.
First use Aug. 15, 1949.

SN 11,515. Zelig Strauss Company, Inc., New York, N. Y. Filed July 3, 1956.

Mistra

For Misses' and Ladies' Slips and Petticoats.
First use June 4, 1956.

SN 11,778. Knitmakers, New York, N. Y. Filed July 9, 1956.

KNITMAKERS

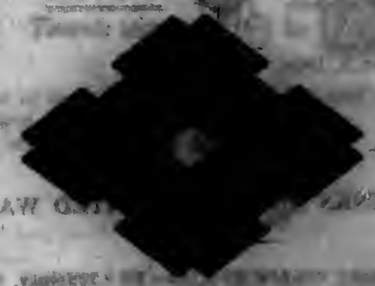
For Blouses, Skirts, Jackets, Dresses, Suits, T-Shirts, and Polo Shirts.
First use May 4, 1956.

SNSN 11,879. Smart Novelty Blouse Co., Inc., New York, N. Y. Filed July 10, 1956.

TERACINO

For Women's, Misses', and Children's Blouses.
First use June 7, 1956.

SN 13,767. Maling Brothers, Inc., Chicago, Ill. Filed Aug. 10, 1956.



Yankee Doodle

For Children's Shoes.
First use July 30, 1956.

CLASS 41

CANES, PARASOLS, AND UMBRELLAS

SN 10,037. Sumitomo Shoji Kabushiki Kaisha, Higashi-ku, Osaka, Japan. Filed June 11, 1956.

Owner of Japanese Reg. No. 428,324, dated July 21, 1953.
For Canes, Parasols, and Umbrellas.

CLASS 42

KNITTED, NETTED, AND TEXTILE FABRICS, AND SUBSTITUTES THEREFOR

SN 753. Chicopee Mills, Inc., New York, N. Y. Filed Jan. 16, 1956.

LUXEL

For Woven Paper Fabric.
First use Nov. 5, 1955.

SN 9,081. California Hand Prints, Inc., Hermosa Beach, Calif. Filed May 28, 1956.

CHALILAN

For Piece Goods Made of Acrylic Fiber and Wool.
First use May 10, 1956.

CLASS 43

THREAD AND YARN

SN 14,009. Luther D. Sanders, d. b. a. Traverse Bay Woolen Company, Traverse City, Mich. Filed Aug. 15, 1956.

TRAVERSE BAY

For Yarns.
First use June 1, 1947.

SN 14,446. Howard G. Godfrey & Co., Inc., New York, N. Y. Filed Aug. 23, 1956.

GODFREYARN

For Yarn.
First use July 17, 1936.

## CLASS 44

## DENTAL, MEDICAL, AND SURGICAL APPLIANCES

SN 8,967. The Maico Company, Incorporated, Minneapolis, Minn. Filed May 24, 1956.

**AURASEAL**

For Ear Protectors in the Nature of Plugs Insertable Into the Ear Canal for Dampening of Noise.
First use Sept. 1, 1955.

SN 9,054. Rothstein Dental Laboratories, Inc., Washington, D. C. Filed May 25, 1956.

**ORAL TONE**

For Dentures.
First use Mar. 5, 1956.

## CLASS 45

## SOFT DRINKS AND CARBONATED WATERS

SN 4,082. George Wolf, d. b. a. The Zil Company, San Francisco, Calif. Filed Mar. 7, 1956.

**ZIL**

For Soft Drink.
First use July 6, 1946.

## CLASS 46

## FOODS AND INGREDIENTS OF FOODS

SN 911. Lavern Pratt, d. b. a. OFC Laboratories, Williamston, Mich. Filed Jan. 17, 1956.

**NU-LAK**

For Additive for Improving the Flavor of Milk Consisting Primarily of Non-Toxic Organic Acids.
First use May 12, 1955.

SN 6,677. Abbotts Dairies Incorporated, Philadelphia, Pa. Filed Apr. 19, 1956.

*Ice Creamwich*

For Food Product Consisting of a Layer of Ice Cream Between Two Sugar Wafers.
First use on or about Nov. 1, 1941.

SN 7,733. The Aula Company, Inc., New York, N. Y. Filed May 7, 1956.

**KUREX**

For Pumping Pickle Compound Used in the Curing of Meats.
First use June 11, 1954.

SN 9,385. P. F. Petersen Baking Company, Omaha, Nebr. Filed May 31, 1956.

**BUTTERFIELD FARMS**

For Bakery Products—Namely, Cakes.
First use Apr. 2, 1956.

SN 9,437. California Walnut Growers Association, Los Angeles, Calif. Filed June 1, 1956.

For Shelled and Unshelled Walnuts.
First use Mar. 23, 1956.

SN 9,611. United Baking Co., Inc., Schenectady, N. Y. Filed June 4, 1956.

**LADY BETTY**

For Bread.
First use Aug. 19, 1924.

SN 9,636. Hawaiian Fruit Growers Exchange, Ltd., Honolulu, Territory of Hawaii. Filed June 5, 1956.

**"PUNCHBOWL"**

For Canned Frosted Fruit Juices.
First use Feb. 27, 1956.

SN 9,677. Shull's Bakery, Inc., Marysville, Pa. Filed June 5, 1956.

**Cin-O-curls**

For Cakes and Rolls.
First use Apr. 2, 1956.

SN 10,011. Northwest Packing Company, Portland, Oreg. Filed June 11, 1956.

**BLUE BELL**

For Canned Green Beans and Canned Fruits.
First use May 1, 1923, on canned green beans.

SN 10,027. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 11, 1956.

**HAWAIIAN Bouquet**

For Canned Pineapple.
First use May 31, 1956.

SN 10,028. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 11, 1956.

**HAWAIIAN Beauty**

For Canned Pineapple.
First use May 31, 1956.

SN 10,029. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 11, 1956.

**HAWAIIAN Belle**

For Canned Pineapple.
First use May 31, 1956.

SN 10,109. Silver Spring Gardens, Inc., Eau Claire, Wis. Filed June 12, 1956.

**SILVER SPRING**

For Horseradish, Cocktail Sauce, Hotdog Relish.
First use June 1, 1937.

SN 10,236. Interstate Bakeries Corporation, Kansas City, Mo. Filed June 14, 1956.

Exclusive right to register the term "Bread" is not claimed apart from the mark as shown. Owner of Reg. No. 270,774.
For Bakery Products—Namely, Bread.
First use on or about Apr. 16, 1954.

SN 10,264. The Swiss Colony, Inc., d. b. a. The Swiss Colony, Monroe, Wis. Filed June 14, 1956.

**SWISS COLONY**

For Cheeses, Jellies and Preserves, Cakes, Sauce, Wild Rice, Broth, Duck, Guinea Hen, and Pheasant.
First use June 1930.

## CLASS 47

## WINES

SN 14,882. Hungarian Grape Products Inc., New York, N. Y. Filed Aug. 30, 1956. Sec. 2(f).

**HERSH'S**

For Wines.
First use Dec. 30, 1940.

SN 15,766. California Champagne Company, d. b. a. Schramsberg Vineyard Co., Calistoga, Calif. Filed Sept. 17, 1956.

*Cotillion*

For Champagne.
First use Aug. 3, 1956.

## CLASS 48

## MALT BEVERAGES AND LIQUORS

SN 689,880. Sicks' Seattle Brewing & Malting Co., Seattle, Wash. Filed June 20, 1955. Sec. 2(f).

There's more Life to

Owner of Reg. Nos. 101,651, 560,498, and others.
For Beer.
First use Jan. 3, 1955.

## CLASS 49

## DISTILLED ALCOHOLIC LIQUORS

SN 877. Emil Ebneter & Co. A. G., Appenzell, Switzerland. Filed Jan. 17, 1956. Sec. 2(f).

Without waiving its common law rights and for the purpose of this registration only applicant makes no claim herewith to the word "Bitters" apart from the mark as shown.
For Beverage Bitters.
First use Feb. 16, 1948; in commerce Feb. 16, 1948.

## CLASS 50

## MERCHANDISE NOT OTHERWISE CLASSIFIED

SN 683,567. Donald F. Weekes, Westwood, N. J. Filed Mar. 15, 1955.

**EVERLAST**

For Garden Stakes.
First use Feb. 14, 1955.

SN 696,033. The Hankins Container Company, Cleveland, Ohio. Filed Oct. 7, 1955. Sec. 2(f).

**HANKINS**

Owner of Reg. No. 626,033.
For Plaques and Holders for Advertising and Displaying Merchandise.
First use on or about Aug. 1, 1933.

SN 10,277. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 14, 1956.

**HAWAIIAN Blossom**

For Canned Pineapple.
First use May 31, 1956.

SN 10,278. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 14, 1956.

**HAWAIIAN Bride**

For Canned Pineapple.
First use May 31, 1956.

SN 10,279. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 14, 1956.

**HAWAIIAN Delight**

For Canned Pineapple.
First use May 31, 1956.

SN 10,280. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 14, 1956.

**HAWAIIAN Gem**

For Canned Pineapple.
First use May 31, 1956.

SN 10,281. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 14, 1956.

**HAWAIIAN Jewel**

For Canned Pineapple.
First use May 31, 1956.

SN 10,282. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 14, 1956.

**HAWAIIAN Maid**

For Canned Pineapple.
First use May 31, 1956.

SN 10,283. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 14, 1956.

**HAWAIIAN Pearl**

For Canned Pineapple.
First use May 31, 1956.

SN 10,284. Hans H. Schumacher, d. b. a. The John Schumacher Company, Alhambra, Calif. Filed June 14, 1956.

**HAWAIIAN Pride**

For Canned Pineapple.

POLLY-PRESS

## REGISTRATIONS PUBLISHED UNDER SEC. 12(c)

The following marks registered under the act of 1905, or the act of 1881, are published under the provisions of section 12(c) of the Trademark Act of 1946. These registrations are not subject to opposition but are subject to cancellation under section 14 of the act of 1946.

### CLASS 6

### CHEMICALS AND CHEMICAL COMPOSITIONS

184,300. May 20, 1924. The Vitro Manufacturing Company, Pittsburgh, Pa. Pub. by Vitro Corporation of America, New York, N. Y.

VITRO

For Oxides of Cobalt, Chromium, Selenium, Zirconium, Titanium, Cerium, and Tin, and for Sulphide of Cadmium.

338,977. Sept. 22, 1936. Dewey and Almy Chemical Company, Cambridge, Mass. Pub. by W. R. Grace & Co., Cambridge, Mass.

DAXAD

For Chemicals Used as Dispersing Agents in the Preparation of Dispersions of Pigments, Colors, Calcareous and Aluminous Substances.

375,413. Feb. 20, 1940. Campos y Quebrachales Puerto Sastre, S. A., Buenos Aires, Argentina. Pub. by registrant.

CAMPOS Y QUEBRACHALES PUERTO SASTRE TANICA EXTRACTO

MARCA REGISTRADA

For Tanning Extracts and Substances.

### CLASS 15

### OILS AND GREASES

114,384. Dec. 12, 1916. Wm. C. Robinson & Son Co., Baltimore, Md. Pub. by William C. Robinson & Son, Company, Baltimore, Md.

CUTALL

For Oil To Be Mixed With Water Used as a Lubricant for Metal-Cutting Tools.

195,392. Feb. 24, 1925. Protane Corporation, Erie, Pa. Pub. by The Protane Corporation, Cleveland, Ohio.

PROTANE

For Liquid Hydrocarbon Fuel.

317,074. Sept. 11, 1934. Apieson Products, Limited, London, England. Pub. by registrant.

APIEZON

For Oils and Greases, Wholly or Partly of Petroleum Origin.

### CLASS 23

### CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

336,703. July 14, 1936. N. S. Meyer, Inc., New York, N. Y. Pub. by registrant.

CONQUEROR

For Sabres, Swords, and Sabre Chains.

337,363. Aug. 4, 1936. N. S. Meyer, Inc., New York, N. Y. Pub. by registrant.

DEFENDER

For Sabres, Swords, and Sabre Chains.

340,027. Oct. 27, 1936. The C. M. Kemp Manufacturing Company, Baltimore, Md. Pub. by registrant.

ATMOS-GAS

For Machine for Treating Gas for Use in Annealing and Other Metal Treating Processes.

### CLASS 43

### THREAD AND YARN

338,208. Sept. 1, 1936. The Clark Thread Company, Newark, N. J. Pub. by Coats & Clark Inc., New York, N. Y.

TRIDENT

For Thread and Yarn.

TM 713 O. G.—7

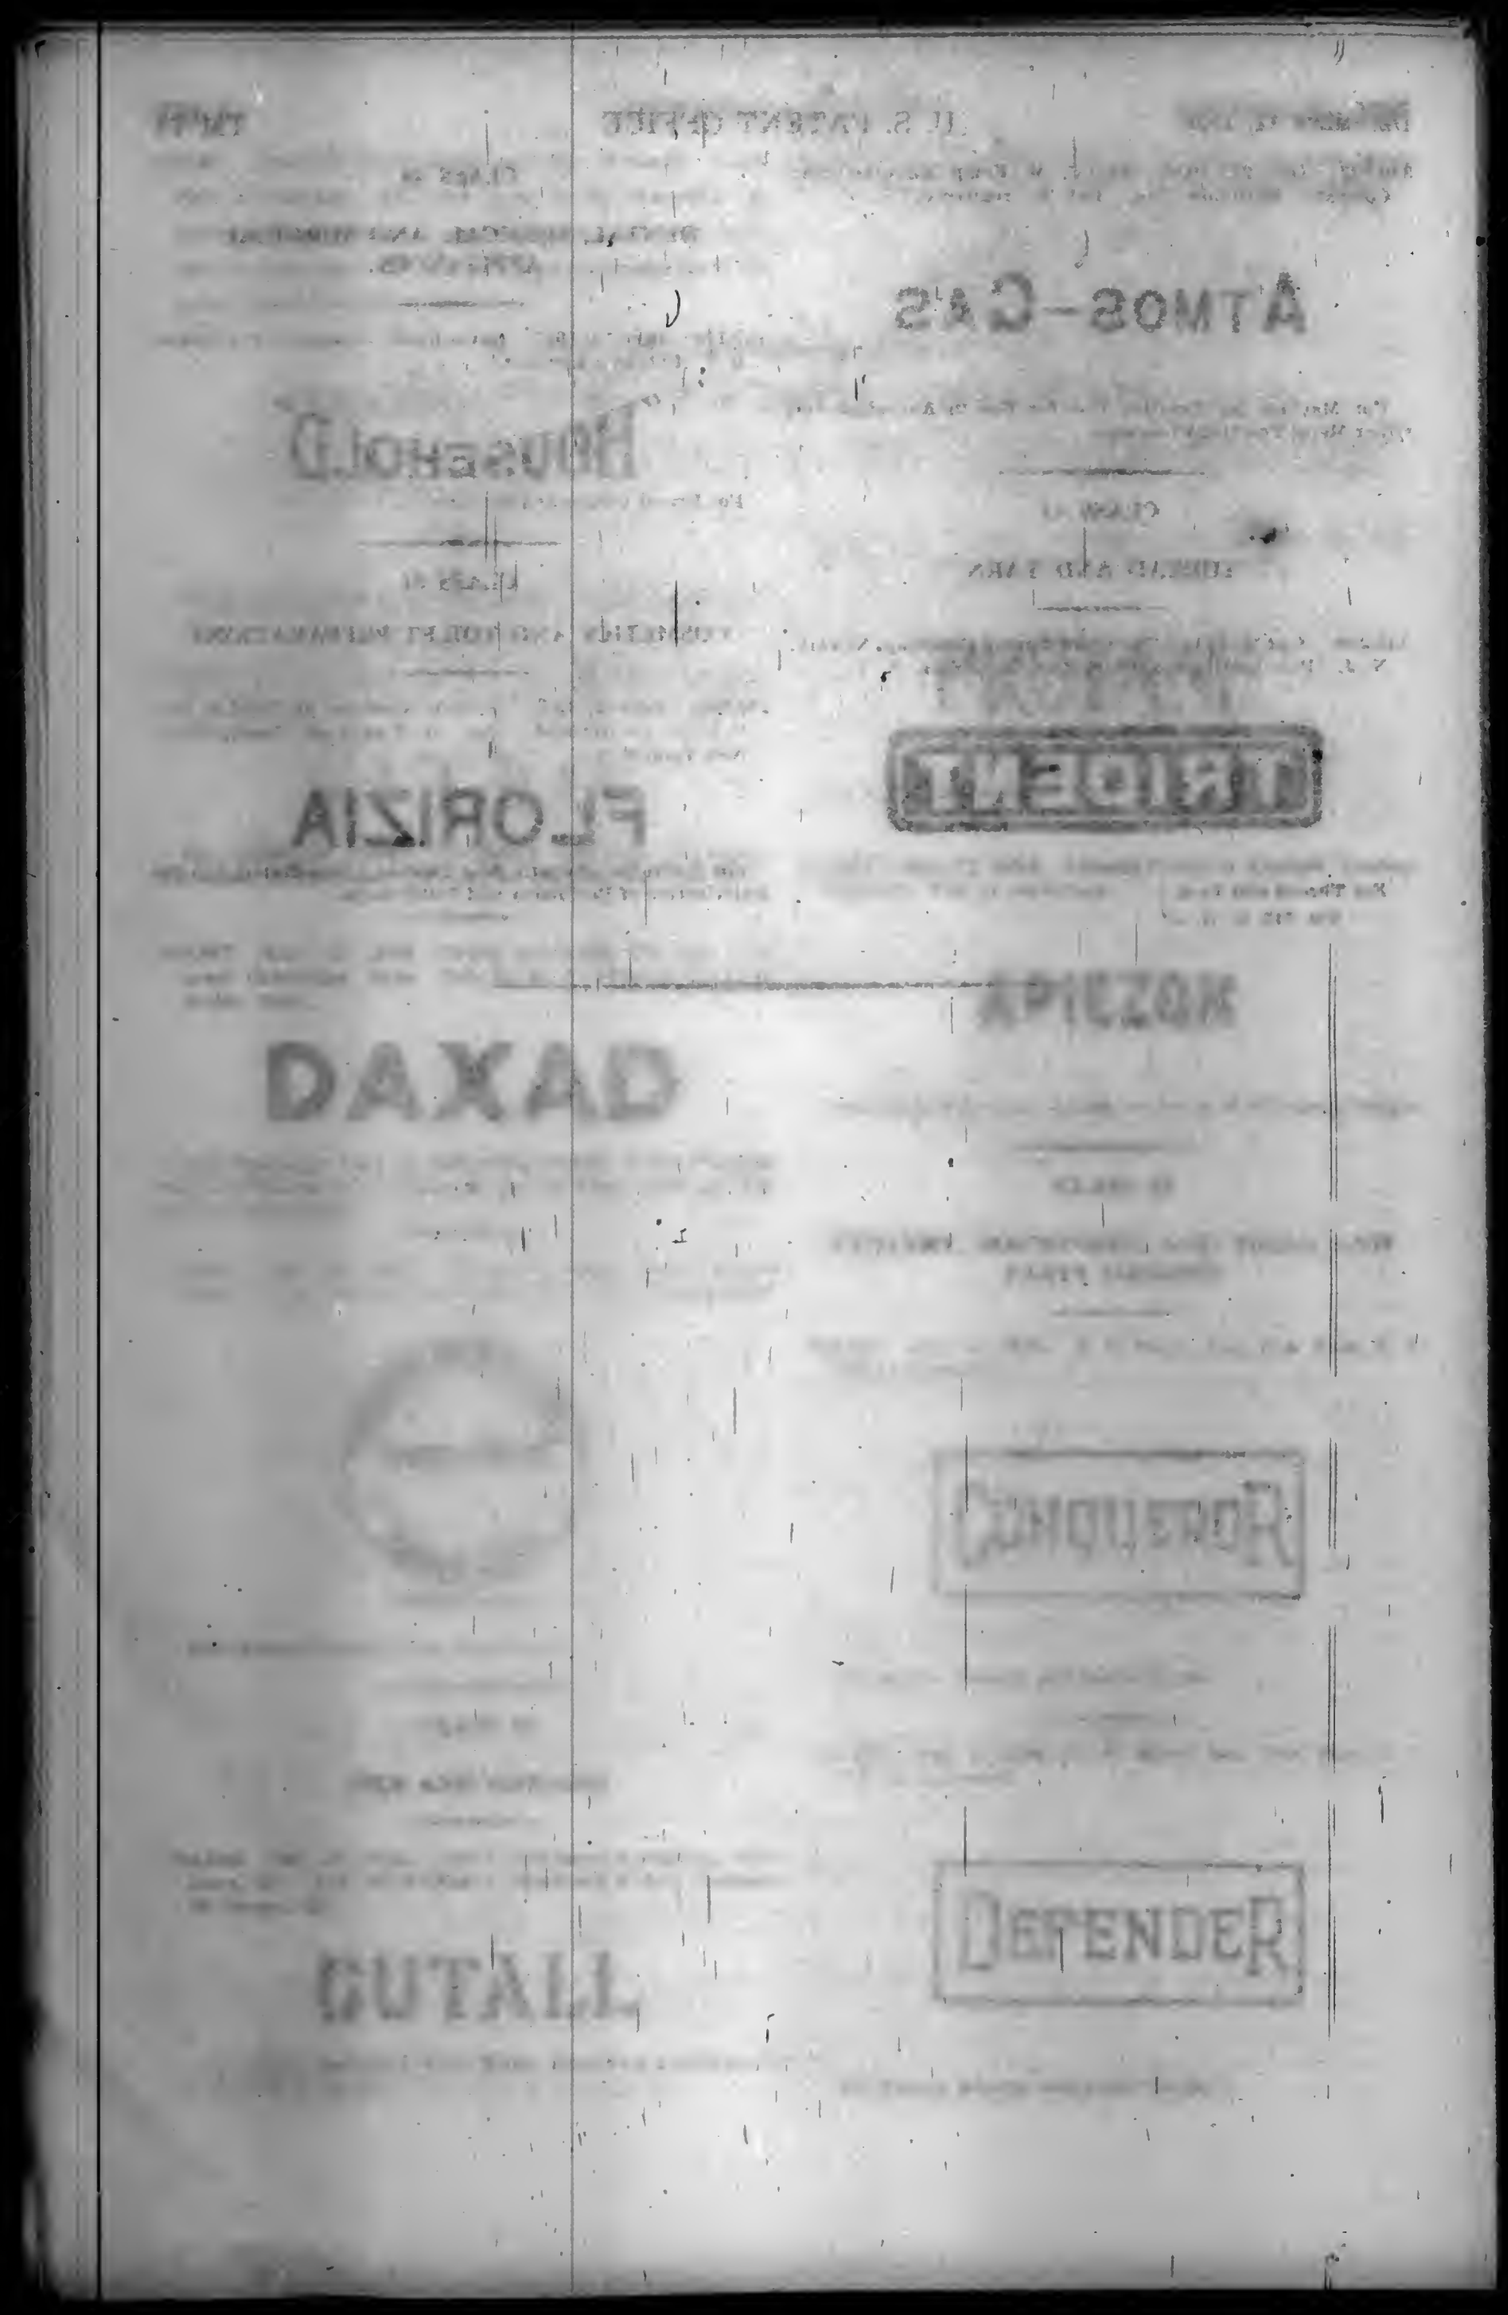
### CLASS 44

### DENTAL, MEDICAL, AND SURGICAL APPLIANCES

117,118. June 19, 1917. Davol Rubber Company, Providence, R. I. Pub. by registrant.

"HOUSEHOLD"

For Breast Pumps and Syringes.



### CLASS 51

### COSMETICS AND TOILET PREPARATIONS

283,685. June 2, 1931. Societe Anonyme M. Naef & Cie., Geneva, Switzerland. Pub. by Firmenich, Incorporated, New York, N. Y.

FLORIZIA

For Synthetic Aromatic Base Used as a Raw Material in the Manufacture of Perfumery and Toilet Soaps.

# PATENTS

## NOTICES

### Amendment to Trademark Rule 2.12

TITLE 37—PATENTS, TRADEMARKS, AND COPYRIGHTS

CHAPTER I—PATENT OFFICE, DEPARTMENT OF COMMERCE

*Part 2—Rules of Practice in Trademark Cases*

PERSONS WHO MAY PRACTICE BEFORE PATENT OFFICE IN TRADEMARK CASES

The following amendment is made to take effect on publication in the Federal Register. The purpose of the amendment is to conform the rule which is amended to a recent court decision.

Paragraph (b) of § 2.12 is amended to read as follows:

§ 2.12 *Persons who may practice before the Patent Office in trademark cases.* • • •

(b) Non-lawyers: Persons who are not attorneys at law as specified in paragraph (a) of this section are not recognized to practice before the Patent Office in trademark cases, except that persons not attorneys at law who were recognized to practice before the Patent Office under this Chapter prior to January 1, 1957, will be recognized as agents to continue practice in trademark cases in the Patent Office.

(Sec. 41, 60 Stat. 440, sec. 1, 66 Stat. 795; 15 U. S. C. 1123, 35 U. S. C. 31)

Dated: November 16, 1956.

[SEAL] ROBERT C. WATSON,
*Commissioner of Patents.*

Approved:
SINCLAIR WEEKS,
*Secretary of Commerce.*

[F. R. Doc. 56—9616; Filed, Nov. 23, 1956; 8:47 a. m.]
(*Published in the Federal Register for November 24, 1956, 21 F. R. 9198*)

### Errata

The claim for Patent No. 2,770,665 appearing in the OFFICIAL GAZETTE of November 13, 1956 is incorrect.

The claim should read:

1. A process for the preparation of propylene tetramer which comprises passing a gas consisting essentially of propylene upwardly through a reactor containing a fixed bed of phosphoric acid polymerization catalyst consisting of a thin film of phosphoric acid adsorbed on quartz particles having a particle size smaller than 4 mesh at a temperature of about 300° to 400° F. and a pressure of about 250 to 400 pounds per square inch to form liquid propylene tetramer, maintaining said reactor full of liquid propylene polymers, and withdrawing said liquid propylene tetramer from the top portion of the reactor.

### Adjudicated Patent

(C. A. Ill.) Cubert Patent No. 2,304,339 (179—107), for an improved mounting of microphone in wearable hearing aid. Claims 1, 2, 15, and 16 *Held* not infringed. *Auree Corp.* v. *Beltone Hearing Aid Co.*, 236 F.2d 644; — USPQ —

### Adverse Decisions in Interferences

In the designated interferences involving the indicated claims of the following patents final decisions have been rendered that the respective patentees were not the first inventors with respect to the claims listed.

Pat. 2,515,196, J. C. Coe, Automatic gain control, decided Aug. 29, 1956, Interference No. 86,915, claims 1, 2, 3, 4, 5, 8, 10, and 11.

Pat. 2,702,612, H. N. Sudduth, Slack adjuster arrangement for empty and load brakes, decided Nov. 8, 1956, Interference No. 87,681, claim 3.

Pat. 2,725,323, G. E. Chadwick, G. E. Collins, and W. J. Roff, Method for the manufacture of fabrics, decided Oct. 31, 1956, Interference No. 88,048, claims 3, 4, 5, and 6.

### Disclaimer

2,715,912.—*Martin H. Cameron*, Dearborn, and *Walter Brutus*, Detroit, Mich. MOVING AIR SUPPLY SYSTEM. Patent dated Aug. 23, 1955. Disclaimer filed Nov. 13, 1956, by the assignee, *Chrysler Corporation*.

Hereby enters this disclaimer to claims 1, 3, 8, 9, 10, 11, and 12 of said patent.

### Patents Available for Licensing or Sale

2,732,026. Muffler With Flashing and Spark Eliminating Means. Burr C. Folts, 422 N. Caroline St., Herkimer, N. Y.

2,766,459. Crease-Maintaining Belt. Vincent Stiglin, 532 51st St., West New York, N. J.

L. V. Grover offers the following two patents. Inquiries concerning the patents should be addressed to: L. V. Grover, 341 West Arden Blvd., Glendale 3, Calif.

2,494,755. Quick Disconnect Socket.

2,513,560. Cut Film Holders for Cameras.

General Electric Company is prepared to grant nonexclusive licenses to domestic manufacturers on reasonable terms under the following 27 patents.

Applications for license under the following 18 patents should be directed to: Hotpoint Co., 227 South Seeley Ave., Chicago 12, Ill.

### New Applications Received During October 1956

| | |
|---|---|
| Patents | 6,722 |
| Designs | 473 |
| Plants | 9 |
| Reissues | 21 |
| Total | 7,225 |

### Issue

| | | |
|---|---|---|
| Patents | 895—No. 2,774,073 to No. | 2,774,967, incl. |
| Designs | 31—No. 179,404 to No. | 179,434, incl. |
| Plants | 3—No. 1,539 to No. | 1,541, incl. |
| Reissues | 1—No. 24,257 | |
| Total | 930 | |

*Electric Ranges and Heating Units Therefor*

2,313,582. Door Structure.
2,519,051. Electric Heating Appliance.
2,525,062. Vent Structure.
2,554,063. Electric Range.
2,565,432. Electric Hotplate Hinge Device.
2,635,600. Backsplash Structure for Stoves.
2,662,157. Surface Heating Unit With Improved Hinge and Ground Connection.
2,716,697. Thrift Cooker.
2,742,557. Controls for Electric Ovens.
2,742,558. Control for Electric Ovens.

*Switching Devices*

2,517,392. Electric Switch.
2,691,084. Control Device.
2,722,574. Switch.

*Miscellaneous Electrical Devices*

2,657,580. Multirange Resistance Thermometer.
2,666,189. Electric Terminal Block Assembly.
2,667,560. Heating Circuit Control for Electric Appliances.
2,691,147. Terminal Block.
2,758,150. Electrical Connector for Refrigerator Defrosting Means.

Applications for licenses under the following patent may be addressed to: General Electric Company, Aircraft Gas Turbine Division, Cincinnati 15, Ohio. Attention: Counsel.

2,459,519. Speed Limiting Arrangements for Turbine Rotors.

Applications for licenses under the following two patents may be addressed to: Patent Counsel, Switchgear & Control Division, General Electric Company, 6901 Elmwood Ave., Philadelphia 42, Pa.

2,599,242. Rotary Circuit Interrupter.
2,757,554. Power Actuator for Doors.

Applications for licenses under the following patent may be addressed to: Patent Counsel, Defense Electronics Division, General Electric Company, Syracuse, N. Y.

2,757,765. Locomotive Grille.

Applications for licenses under the following four patents may be addressed to: Patent Counsel, Construction Materials Division, General Electric Company, 1285 Boston Ave., Bridgeport 2, Conn.

2,752,442. Pull-Operated Switch With Arc Snuffer.
2,752,581. Convenience Outlet With Protective Rotating Shutters.
2,756,401. Combined Appliance Outlet and Fuse Holder.
2,756,403. Combined Cord Connector and Strain Relief.

Applications for licenses under the following patent may be addressed to: General Electric Company, Aircraft Products Department, 1 River Road, Schenectady 5, N. Y.

2,752,574. Method and Apparatus for Electrical Filtering.

# CONDITION OF PATENT APPLICATIONS AS OF OCTOBER 31, 1956

| | |
|---|---|
| Total number of pending applications (excluding Designs) | 217,058 |
| Total number of pending Design applications | 6,321 |
| Total number of applications awaiting action (excluding Designs) | 117,257 |
| Total number of Design applications awaiting action | 2,972 |
| Date of oldest new application | June 27, 1955 |
| Date of oldest amended application | June 18, 1954 |

## EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during December 1956, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1955*.

Patents ..... Numbers 2,181,858 to 2,185,169, inclusive
Plant Patent ..... Numbers 349 to 351, inclusive

# PATENT SUITS

Notices under 35 U. S. C. 290; Patent Act of 1952

**2,649,718**, H. E. Tants, Trunnion, filed May 29, 1952, D. C., W. D. Wis. (Madison), Doc. 2341, *Rockwell Mfg. Co. v. Yates-American Machine Co.* Patent held invalid and not infringed as to claims 1, 2, 3, 4, 10, and 11; complaint dismissed Nov. 12, 1956.

**2,321,597**. (See Re. 23,137.)

**2,338,911**, C. E. Emmer, Machine for applying plastic bindings; **2,556,644**, same, Portable punching machine, filed Nov. 13, 1956, D. C., N. D. Ill. (Chicago), Doc. 56c1898, *General Binding Corp. v. Cummins-Chicago Corp.*

**2,359,476**, C. K. Gravley, Electrostatic method and apparatus, filed Aug. 3, 1953, D. C., N. D. Ohio (Cleveland), Doc. 30436, *Ransburg Electro-Coating Corp. v. Metaloid Co. et al.* Consent decree; patent and claims held valid and infringed; injunction granted Nov. 14, 1956.

**2,425,655**, E. H. Tompkins, Therapeutic device, filed Nov. 14, 1956, D. C., N. D. Tex. (Wichita Falls), Doc. 1110, *Mattarama, Inc. et al. v. United Mattress Co. et al.*

**2,443,187**. (See Re. 23,137.)

**2,513,694**, G. O. Hall, Curing of meat to inhibit undesirable color change, filed Jan. 6, 1955, D. C., E. D. Va. (Richmond), Doc. 2084, *Hall Laboratories, Inc. v. Kingan, Inc.* Judgment favor plaintiff; patent held infringed by defendant and its privy, Hygrade Food Products Corp. Sept. 24, 1956. Same, appeal filed Nov. 8, 1956, C. C. A., 4th Cir., Doc. 7350, *Kingan, Inc. v. Hall Laboratories, Inc.*

**2,524,704**, R. Henderson, Card indexing device; Des. 154,848, same, Selective index or similar article, filed Jan. 18, 1955, D. C., S. D. N. Y., Doc. 98/152, *Robert Henderson v. Brown & Bigelow.* Stipulation and order of dismissal with prejudice Nov. 9, 1956.

**2,531,234**, P. H. Seckel, Longitudinally separable extruded thermoplastic strip and process of producing same, filed Mar. 21, 1951, D. C. N. J. (Newark), Doc. 285/51, *Anchor Plastics Co., Inc. et al. v. Stay-Rite Supply Co. et al.* Patent held invalid; complaint dismissed Nov. 15, 1956.

**2,556,044**. (See 2,338,911.)

**2,561,986**, P. A. Jones, Recessed light fixture with separate outlet box, filed Nov. 13, 1956, D. C., N. D. Ill. (Chicago), Doc. 56c1903, *Preston A. Jones et al. v. Marketone Mfg. Co.*

**2,562,134**, A. Romolt, Handle for luggage, filed Apr. 6, 1955, D. C. N. J. (Newark), Doc. 325/55, *Philadelphia Brief Case Co. et al. v. Specialty Leather Products Co., Inc.* Judgment favor defendant Nov. 13, 1956.

**2,677,971**, H. B. Greenwood, Angular adjustment device; **2,705,143**, same, Skip-feed mechanism, appeal filed Nov. 6, 1956, C. C. A., 4th Cir., Doc. 7346, *Flynn & Emrich Co. v. Greenwood Engineering Co., Inc. et al.*

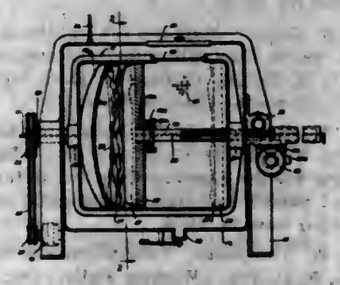
**2,705,143**. (See 2,677,971.)

**Re. 23,137** (of 2,443,187), J. C. Hobbs, Pipe coupling; **Re. 23,272** (of 2,321,597), same, Valve construction, filed Mar. 19, 1951, D. C., W. D. Wis. (Madison), Doc. 2188, *James C. Hobbs v. Wisconsin Power & Light Co. et al.* Claims 1 to 10 incl., 12 to 15 incl., 17, 19, 20, 22, and 23 of Re. 23,272 held invalid; claims 1 to 3 incl., 7 to 10 incl., 12, 15, 17, 19, 20, 22, and 23 of Re. 23,272 held not enforceable against defendants; claims 1, 5, 6, and 7 of Re. 23,137 held invalid; no infringement to any valid claim owned by plaintiff; complaint dismissed Nov. 12, 1956.

**Re. 23,272**. (See Re. 23,137.)

**Re. 23,849**, W. Baltz, Suspended horse, filed Sept. 7, 1955, D. C., W. D. Tenn. (Memphis), Doc. —, *Wonder Products Co. et al. v. V. F. Botto & Co. et al.* Reissue patent held valid and infringed Oct. 31, 1956.

**Des. 154,848**. (See 2,524,704.)



# REISSUES

## DECEMBER 18, 1956

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

**24,257**
**COMBINED WASHING AND SQUEEZE DRYING MACHINE**
**Leo M. Kahn, Island Park, N. Y.**
**Original No. 2,611,257, dated September 23, 1952, Serial No. 607,587, July 28, 1945. Application for reissue September 6, 1956, Serial No. 608,415**
**15 Claims. (Cl. 68—21)**

1. In a washing and drying apparatus including a washing drum having perforations formed therein, means to express wash water from a mass of washed articles in said washing drum, said means comprising a pair of fluid operated members laterally enclosing said mass of washed articles, first pressure means for bodily advancing one of said fluid operated members within the drum and toward the other member so as to embrace said mass and second pressure means operative after said mass has been embraced by the action of said first pressure means, said second pressure means operated to apply fluid under pressure to at least one of said fluid operated members, said

fluid under pressure exerting a considerably higher force than said first pressure means so as to express the wash water from said mass.

# PLANT PATENTS

## GRANTED DECEMBER 18, 1956

Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.

**1,539**
**CAMELLIA PLANT**
**Rene Casadaban, Abita Springs, La.**
**Application January 30, 1956, Serial No. 562,353**
**1 Claim. (Cl. 47—60)**

A new and distinct variety of camellia plant of the Sasanqua class, substantially as herein shown and described, characterized particularly as to novelty by its strong and improved growing habits, its free-blooming habit, and by its double flowers of Red general color tonality comparable to the color of the flowers of the variety "Shishi-gashira" (unpatented).

**1,540**
**ROSE PLANT**
**Eugene S. Boerner, Newark, N. Y., assignor to Jackson & Perkins Company, Newark, N. Y., a corporation of New York**
**Application January 5, 1956, Serial No. 557,619**
**1 Claim. (Cl. 47—61)**

A new and distinct variety of rose plant of the large-flowered polyantha class, substantially as herein shown and described, characterized particularly as to novelty by its free flowering habit, the very stiff petals and long-lasting quality of its flowers, and the colorful effect attributed to its long-lasting White flowers and rich foliage, with attending suitability for out-of-door decoration.

**1,541**
**ROSE PLANT**
**Eugene S. Boerner, Newark, N. Y., assignor to Jackson & Perkins Company, Newark, N. Y., a corporation of New York**
**Application January 5, 1956, Serial No. 557,620**
**1 Claim. (Cl. 47—61)**

A new and distinct variety of rose plant of the large-flowered polyantha class, substantially as herein shown and described, characterized particularly as to novelty by its very free flowering habit, its extremely rich fragrance, the long-lasting keeping quality of its flowers both as cut flowers and on the bush, and the distinctive Cameo Pink lightly overcast with Rose Pink general color tonality of its flowers, said color being maintained without appreciable fading throughout substantially the entire life of the flowers.

# PATENTS

## GRANTED DECEMBER 18, 1956

## GENERAL AND MECHANICAL

**2,774,073**
**LADIES' GIRDLES**
**Henry M. Herbener, Thomasville, Ga.**
**Application April 30, 1954, Serial No. 426,691**
**10 Claims. (Cl. 2—36)**

2. A girdle or like garment comprising a flexible body encircling portion which tends to roll at its top, resilient supporting means secured to the body encircling portion and serving to oppose such rolling action, said resilient supporting means including upper and lower frame sections, the upper frame section including generally radial substantially U-shaped loops which are connected at their outer ends, said generally radial loops extending throughout the bottom of the upper frame section, said lower frame section including generally radial substantially U-shaped loops which are connected at their outer ends, the radial loops of the lower frame section extending throughout the top of the lower frame section, and a stiff coupling element connecting the bottom of the upper frame section and the top of the lower frame section adjacent to their longitudinal centers and engaging with certain of the radial loops in said bottom and top for holding such engaged loops against turning movement with respect to the coupling, said coupling being positioned near the elevation of that portion of the body where the most bending occurs, the substantially U-shaped loops in said bottom extending for a substantial distance beyond each end of the coupling element and the substantially U-shaped loops in said top extending for a substantial distance beyond each end of the coupling element, the arrangement being such that the torsional action occurs in said substantially U-shaped loops arranged exteriorly of said coupling element when a relative angular movement is effected between the upper and lower frame sections.

**2,774,074**
**GARMENTS WITH INTERLININGS**
**Alfred Lehmann, Unterflockenbach im Odenwald, Germany**
**Application March 22, 1954, Serial No. 417,781**
**9 Claims. (Cl. 2—97)**

1. In combination with an article of apparel which includes a shape imparting interlining, said interlining consisting of a full interlining and at least one arched plaque secured thereto for imparting said shape, the provision of a plaque comprising: a thin, non-woven, porous, air-permeable, flexible, isotropic sheet material consisting in its entirety of an open skeleton of intermingled, fine, cardable, polyposed moisture absorbent fibers; and resilient adhesive means interconnecting said fibers at their points of intersection to form said fibrous sheet material with preservation of numerous, relatively large interstices between the fibers, said interstices communicating with each other to form circuitous paths for the circulation of air transversely through the sheet material, portions of said fibers intermediate said points of intersection being exposed for the absorption of perspiration.

**2,774,075**
**GARMENT WITH DETACHABLE SLEEVES**
**Mario Giovanni Saccoccio, Malverne, N. Y., assignor to Princess Fair Blouse, Inc., New York, N. Y., a corporation of Maryland**
**Application October 25, 1955, Serial No. 542,729**
**1 Claim. (Cl. 2—106)**

A garment having detachable sleeves with the adjacent shoulder portions thereto presenting a smooth appearance, comprising a body portion provided with sleeve openings therein, the upper edge portions of said sleeve openings sloping upwardly and the lower edge portions of said sleeve openings extending at an angle with respect to the upper edge portions thereof and downwardly, a bound portion defining the leading edge of each of said sleeve openings, a circumferential planar holding member secured within the forward portion of the interior surface of each of said sleeve openings about the entire circumference thereof and having only its leading longitudinal edge disposed within said bound portion and fastened thereto, with the trailing longitudinal edge thereof being entirely free of said sleeve opening; spaced fastening means upon said holding member, detachable sleeve members adapted to terminate above the elbow of the wearer secured to said body portion at said sleeve openings, wherein said sleeve members are of sufficient circumferential size to permit the arm of the wearer to be loosely disposed therein, an additional holding member secured to the upper portion of the outer surface of each of said sleeve members, and additional spaced fastening means complementary to said first-named fastening means upon said additional holding member.

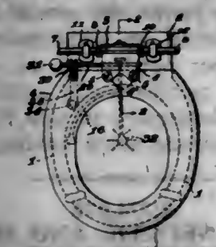
**2,774,076**
**TUBULAR NECKTIE AND MODE OF MAKING SAME**
**Theodore M. Brostoff, Hollywood, Calif.**
**Application July 19, 1955, Serial No. 522,977**
**3 Claims. (Cl. 2—146)**

1. The method of producing a tubular necktie consisting in hemming the ends of a facing strip with over-

lying end portions of the latter, applying a lining strip over said facing strip on the side thereof opposite the overlying end portions thereof with one longitudinal margin thereof aligned with one of the longitudinal margins of said facing strip and with one end of the lining inturned around and overlying the adjacent hemmed end of the facing strip, stitching together said aligned marginal portions of said strips together with

said inturned end of the lining strip, inturning the other end portion of the lining strip over the adjacent hemmed end of the facing strip and stitching one marginal portion thereof to the previously stitched margins of the strips, aligning and stitching together the other marginal portions of the strips thereby forming a fabric tube having its ends closed by the inturned ends of the lining strip, and then turning the resultant fabric tube inside out.

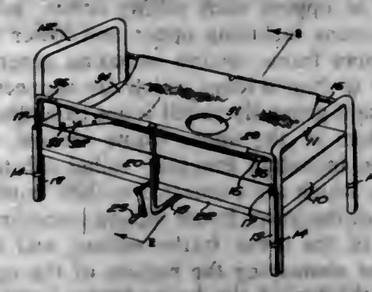
---



**2,774,077**
**HEAT AND WEAR RESISTING MATERIAL AND ARTICLE FORMED THEREOF**
Charles K. Preasler and John H. Weaver, Newark, Ohio
Application October 15, 1953, Serial No. 386,312
8 Claims. (Cl. 2—167)

1. An article of heat resisting wearing apparel comprising an inner casing shaped to receive a portion of the human anatomy; an outer casing substantially conforming to and carried by said inner casing, said outer casing having a base sheet of woven fibers; and a covering of chenille composed of glass fibre yarns on the outer side of said base sheet.

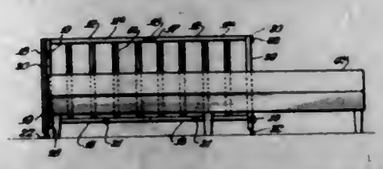
---



**2,774,078**
**BIDET SEAT**
Nicolas Pazos, Havana, Cuba
Application December 13, 1954, Serial No. 474,768
3 Claims. (Cl. 4—7)

1. In a bidet seat connected to a block hinged to a shaft secured to the rear portion of a water closet bowl, said shaft being a pipe and serving as a water inlet, a douche pipe having an open end slidably mounted through an opening in the block, said douche pipe having its open end adapted for fitting against packing fixedly located within the block, the said open end of the douche pipe being straight and rotatably mounted in the block and the opposite end terminating in a spray nozzle and being curved to follow the contour of the seat, a spring coiled around the douche pipe, a geared sector secured to the straight portion of said douche pipe, said spring having one end secured under the seat and the other end secured to the geared sector and being under tension to normally rotate the curved portion of said douche pipe beneath the seat and urge the open end of the douche pipe into sealed engagement with said packing, a hand actuated rod slidably mounted on the block and provided with teeth at a portion thereof meshing with said sector, the block and a portion of the geared sector having cam surfaces thereon, which, when the geared sector is rotated cause the same to draw back with the douche pipe pressing the said spring and unseating the open end of the douche pipe from the packing while the curved end of the douche pipe is swung from beneath the seat so that the spray nozzle is in operative position.

---

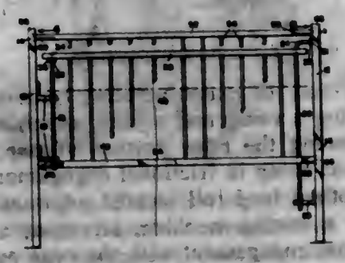


**2,774,079**
**AUXILIARY BED HOIST**
Margaret J. Flatley, Pawtucket, R. I.
Application March 27, 1953, Serial No. 345,024
2 Claims. (Cl. 5—84)

1. An auxiliary bed hoist comprising a pair of spaced parallel rails extending along each side of a bed, means independent of the bed for supporting said rails at each end, means for simultaneously raising or lowering said rails, and a supporting fabric extending over said bed and releasably hooked to said rails, said raising means comprising a bar mounted transversely beneath said bed and having a crank at one end, said bar having oppositely disposed threads toward each end, a threaded collar riding on each set of threads, a U-shaped bar connected to said rails and extending beneath said threaded bar, a fixed collar in the center of said U-shaped bar, and a pair of pivoted links connecting said fixed collar to said threaded collars.

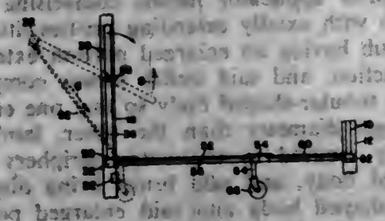
---

**2,774,080**
**CONVERTIBLE PLAYPEN AND BED GUARD CONSTRUCTION**
Alvin J. Randall, Evanston, Ill.
Application February 1, 1954, Serial No. 407,497
6 Claims. (Cl. 5—93)



5. An article of manufacture being a convertible playpen and bed guard device and comprising a pair of opposed vertical playpen side members; a vertical playpen first end member being adapted to serve as a head board and being secured to said side members; connector means on the ends of said side members opposite said first end member; a vertical second end member releasably connected opposite said first end member to said side members; a playpen floor connected to said second end member and when in use extending inwardly toward said first end member, said second end member and said floor being removable from said playpen; a releasably mounted floor support mounted adjacent said first end member opposite the connector means when said article is used as a playpen, said floor support being connected to said connector means and disposed opposite said first end member when said second end member and floor are removed from the playpen to thereby provide a bed guard.

---



**2,774,081**
**CONSTRUCTIONS FOR DEMOUNTABLE CRIBS**
Elso J. Luikala, Ashburnham, Mass.
Application October 8, 1953, Serial No. 384,953
12 Claims. (Cl. 5—99)

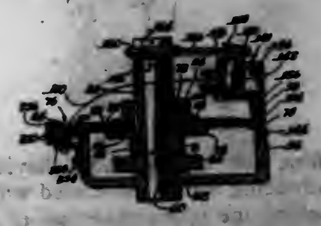
10. A crib construction comprising end panel members, a detachable rear wall and a front drop side, detachable joints at the ends of the rear wall for separable connection to the end panel members, a fitting on each end panel member, a slide rod for detachable securement to each fitting, said front drop side being slidably mounted on said slide rods when the latter are assembled to the end panel members, each joint comprising a hook on the rear wall and a cooperating fitting in the respective end panel member, each fitting having an interior surface slanted relative to the rear wall and receiving the hook and camming the same inwardly upon a pivoting motion between the rear wall and the respective end panel member.

---

**2,774,082**
**FOLDING PLAY-YARD**
Robert W. Bowman and James W. Hendricks, Gardner, Mass., assignors to Gem Crib and Cradle Company, Gardner, Mass., a corporation of Massachusetts
Application April 14, 1955, Serial No. 501,308
17 Claims. (Cl. 5—99)

8. A folding play-yard comprising a front frame, a wall pivoted therein, side walls and a rear wall, a folding floor having a part hinged at one edge to an edge of the pivoted wall and folded thereon by rotation thereof, said floor including a part having a free edge remote from its hinged edge, said free-edged part being foldable onto the pivoted wall to depend therefrom in supported relation thereto at the outside aspect thereof, with the hinged floor part at the inside aspect of the pivot wall, the latter being pivoted on a horizontal axis, and including means to latch the pivoted wall in upright condition.

---

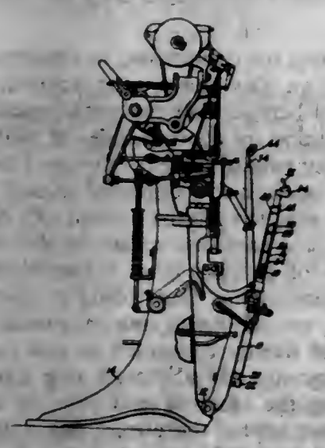


**2,774,083**
**LOCKING MEANS FOR CAM OPERATED CHASERS**
Duro Stora, Buenos Aires, Argentina
Application September 9, 1954, Serial No. 455,042
5 Claims. (Cl. 10—122)

1. A threading die comprising, in combination, support means having an axis and an end portion; at least one pair of die members slidably mounted opposite each other in said end portion on opposite sides of said axis and adjustable thereto; cam disc means mounted turnably about said axis and operatively connected to said die members to adjust their position relative to said axis during turning movement of said cam disc means, said cam disc means having a pair of parallel faces substantially normal to said axis and one of said faces being in contact with said die members; an abutment ring surrounding said cam disc means and fixedly connected to said end portion of said support means, said abutment ring having an abutting face facing the other of said faces of said cam disc means and being spaced therefrom; and a pair of locking means screwed into said cam disc means, said locking means located respectively on opposite sides of said axis, each of said locking means having a locking face facing said abutting face and located between said other face of said cam disc means and said abutting face of said abutment ring, said locking faces being movable from a first position where said locking faces are spaced from said abutting face to a second position where said locking faces are clamped against said abutting face, whereby when said locking faces are in said first position said cam disc means is freely turnable to adjust said die members and when said locking faces are in said second position said cam disc means is pressed against said die members so that said cam disc means is prevented from turning and said die members are locked in their positions.

---

**2,774,084**
**WASHER FEED MEANS FOR ASSEMBLY MACHINE**
Moritz H. Nielsen, Chicago, Ill., assignor to Illinois Tool Works, Chicago, Ill., a corporation of Illinois
Original application October 11, 1951, Serial No. 250,914, now Patent No. 2,711,550, dated June 28, 1955. Divided and this application February 16, 1955, Serial No. 488,646
6 Claims. (Cl. 10—169)



1. Washer feeding apparatus comprising an inclined movable feed member having an inclined surface receiving a supply of washers to be fed and having marginal recesses receiving washers from the inclined surface of the feed member and substantially complementary to such washers, a second movable member spaced below and parallel to said feed member and having marginal recesses similar to those in the feed member and in alignment with the recesses of said feed member, means for driving both of said members in unison, and a fixed plate

of limited extent positioned between said feed member and said second member for first supporting washers in the recesses of said feed member and then dropping the washers into the recesses of said second member.

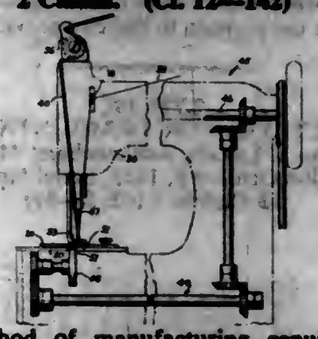
2,774,085
**HEEL END ASSEMBLING MACHINES**
Ernest L. Butler, Lynn, and Otis M. Holmes, Beverly, Mass., assignors to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application December 22, 1953, Serial No. 399,692
18 Claims. (Cl. 12—1)

8. In a machine for operating on shoes, the combination with an operating instrumentality, of work supporting means and a depressor, both the work supporting means and the depressor being constructed and arranged to provide for the positioning of the work in any one of a plurality of predetermined angular positions relatively to the operating instrumentality.

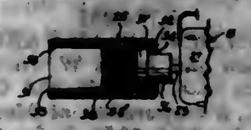
---



2,774,086
**HEEL REST MECHANISMS**
Philip E. Burby, Beverly, Mass., assignor to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application July 13, 1953, Serial No. 367,381
6 Claims. (Cl. 12—12.4)

3. In a machine for lasting shoes having a frame structure, end-embracing wipers associated with the frame structure for working the upper materials of a shoe into lasted position at the toe end of the shoe, a toe plate and a toe rest for clamping the toe end of the shoe against said plate, a heel rest for engaging the heel end of the shoe, said heel rest comprising a heel-engaging member, a support held against movement in a direction lengthwise of the shoe away from said wipers and provided with a substantially flat surface lying in a plane extending transversely of the shoe, and antifriction means interposed between said heel-engaging member and the flat surface on said support, a guide member rigidly secured to the frame structure in offset lateral relation to a shoe in the machine, and means for movably mounting said support on the guide member.

---



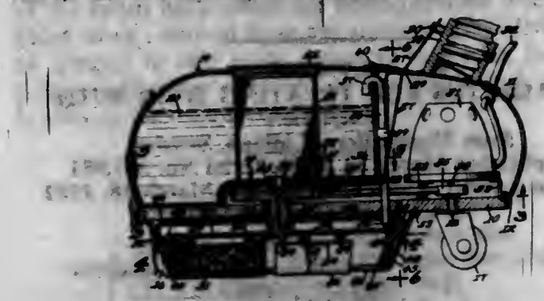
2,774,087
**METHOD FOR SECURING TOGETHER MOCCASIN VAMPS AND PLUGS**
Joseph D. Bozza, Jersey City, N. J., assignor to Jo-An Shoe Mfg. Co., Inc., Fair Lawn, N. J.
Application November 12, 1953, Serial No. 391,458
2 Claims. (Cl. 12—142)

1. The method of manufacturing genuine moccasin footwear having a vamp and a plug, which method comprises: positioning the edge portion of one face of the forepart of said vamp in frictional engagement with a rotating saw-toothed feed roll located adjacent one side of the needle of a sewing machine, arranging a cord along and in frictional engagement with the edge portion of the opposite face of said forepart of said vamp for movement therewith, under said needle, constantly tensioning said cord so that the frictional engagement between said cord and vamp edge portion retards the cord-engaged face to a speed below that of the said opposite face thereby producing substantially uniform gathers along said vamp edge portion, and stitching said cord to and along said gathered vamp edge portion to retain the latter in gathered condition, and then securing the edge of said plug to the gathered and stitched edge of said vamp.

---

2,774,088
**POWER OPERATED SHOE POLISHER**
Edward F. Liska, Berwyn, Ill.
Application November 30, 1953, Serial No. 395,115
2 Claims. (Cl. 15—4)

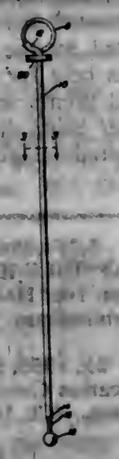
1. For a power operated shoe polisher, a rotatable combination shoe polish applicator means and a buffer, said shoe polish applicator means comprising a brush having a hub with axially extending bristles fitted thereupon, said hub having an enlarged portion extending in a radial direction, and said buffer means comprising a tapered rigid tubular-shaped body so that one end thereof is of larger diameter than the other, lamb's wool means fixedly secured to the outer periphery of said tubular-shaped body, and said brush being disposed in said tubular-shaped body and said enlarged portion of said hub being in frictional interengagement with the inner periphery of said tubular-shaped body whereby said buffer and brush will rotate in unison.



---

2,774,089
**AUTOMATIC FLOOR MOP**
Lester H. Brown, Indianapolis, Ind.
Application October 15, 1954, Serial No. 462,564
2 Claims. (Cl. 15—98)

1. In a cleaning implement, a horizontally disposed base, a hollow housing mounted on said base, a container



for holding a quantity of fluid positioned in said housing and supported on said base, a cylindrical filter positioned in said container, a lid removably mounted on said container above said filter, there being an opening in the bottom of said container, a hollow bearing arranged in said base, a vertically disposed driven shaft rotatably supported in sad bearing and provided with a bore, a resilient bushing positioned in the opening in the bottom of said container, a bracket arranged in engagement with said bushing, a manually operable cable connected to said bracket, a first pulley mounted on the upper end of said shaft, a motor mounted on said base and positioned in said housing, a drive shaft operated by said motor, a second pulley mounted on said drive shaft, an endless belt trained over said first and second

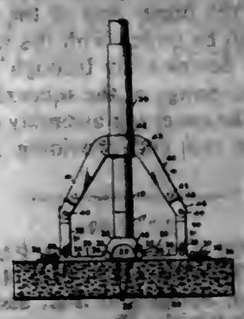
pulleys, a hollow open drum having a truncated, conical annular wall directly joined intermediate its bottom and top by a partition connected centrally thereof and coaxially with said drum directly to said driven shaft, said partition provided with a plurality of circumferentially spaced cutouts adjacent its junction with said wall, a tube having its lower end projecting down into the top portion of said drum adjacent said cutouts and its upper end communicating with said container, the truncated end of the conical wall being its bottom, a plurality of spring pressed plates secured to said partiton and arranged therebelow, a cleaning element connected to the lower surface of each of said plates, a guard secured to said base and surrounding said rotary drum, wheels positioned below said base and connected thereto, and a handle extending upwardly from said housing and secured thereto.

---

2,774,090
**GUN CLEANING ROD**
Neil Allinson, Bellingham, Wash.
Application April 20, 1953, Serial No. 349,695
2 Claims. (Cl. 15—104.165)

1. As a new article of manufacture, a gun barrel cleaner comprising a straight, substantially rigid steel rod, said rod being copper-clad to render the same substantially non-corrodible and being provided at one end with a finger ring, said ring being formed by bending one end portion of the rod without closing the ring and constituting handle means, said rod being provided at its opposite end with an enlarged malleable metal head to facilitate the use of a conventional cleaning patch in conjunction with said head, a protective sleeve encasing and fixed on said rod and having one end portion laterally directed and extending onto and snugly encasing a portion of the finger ring to guard against lengthwise slippage of said one end portion relative to either the finger ring or the adjacent portion of the rod, the opposite end of said sleeve terminating in spaced relation from said head to expose a portion of the rod between the sleeve and head and to facilitate the fastening of the aforementioned patch by tying or otherwise.

---



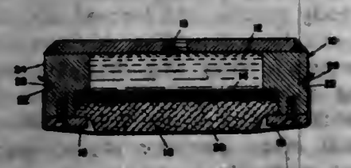
2,774,091
**WRINGER TYPE MOP**
Nathaniel B. Greenleaf, Toronto, Ontario, Canada
Application July 31, 1951, Serial No. 239,449
7 Claims. (Cl. 15—119)

1. In a cleaning device, a mop head having lug extensions struck up therefrom and integral therewith, a split socket of generally tubular shape and formed with an open sided substantially rectilinear base presenting at the open side thereof opposite edge portions of said socket in contiguous coplanar relation, said lug extensions forming a pattern to guide said socket into assembled relation with said head, with said socket base and extensions in abutting contact over an appreciable surface area and with one of said lug extensions in contact with said coplanar edge portions and bridged across the opening therebetween, and means rigidly securing said socket base to said extensions and fixing said base in rectilinear form.

---

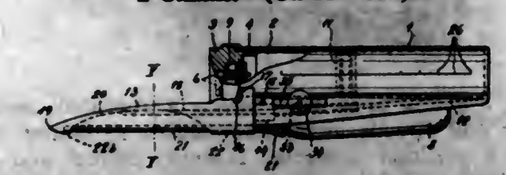
2,774,092
**MOP DEVICE, TOGGLE OPERATED**
Sidney P. Vaughn, San Diego, Calif.
Application October 31, 1951, Serial No. 254,133
14 Claims. (Cl. 15—119)

12. A mop device comprising, a handle, a rigid unitary attaching head secured to the handle, said attaching head including a body portion and spaced members carried by the body portion and formed integral therewith, said spaced members extending downwardly below the body portion and forming with the body portion a deep recess having a lower open end, said members being immovable with relation to the body portion and in relation to each other, pressure plates, spaced separate pivot elements pivotally connecting the inner end portions of the pressure plates with said members, the pivot



elements being arranged exteriorly of the recess and spaced from the upper end of the recess, said plates being shiftable to opened and closed positions, parts of said unitary attaching head being arranged to contact with parts of said pressure plates to limit the opening movement of the pressure plates, a sponge mop element arranged beneath the pressure plates and secured thereto and including a continuous intermediate portion extending across the lower open end of said recess when said pressure plates are in the opened position, and means to swing the pressure plates to the inner position, said means being separate from the unitary attaching head and including an element mounted upon the handle to move longitudinally thereof.

2,774,093
**TOILET MOP AND CONTAINER THEREFOR**
James D. Klag, Greenwich, Conn.
Application October 16, 1952, Serial No. 315,070
1 Claim. (Cl. 15—123)



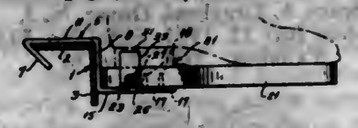
A toilet mop and container therefor comprising an open top vessel adapted to contain a disinfectant, a standard cover top removably attached to the open top vessel, an inverted squeezing cup having a bottom end, said bottom end disposed adjacent to the inner face of the cover top to depend therefrom, said cover top and said bottom end of the cup having aligned central openings, a bushing extending through said aligned openings and upwardly from the outer face of the cover top, said bushing having a peripheral flange on its lower end engageable with the inner face of the bottom end of the inverted cup, an elongated handle sleeve surrounding and secured to the upper end of the bushing, the outside diameter of said handle sleeve being greater than the diameter of the aligned openings and engaging the outer face of the cover top to prevent the downward displacement of the sleeve therethrough and to hold the cup, bushing and sleeve upon the cover top in tight assembled relationship therewith, an elongated handle rod slidable through the handle sleeve and bushing, said handle rod being substantially greater in length than the depth of the vessel, a sponge attached to the lower end of the handle rod and adapted to be pulled into said squeezing cup by said rod to free the sponge of excess disinfectant, and a partial stop handle member fixed to the upper end of the elongated handle rod and adapted to be united with the said handle sleeve, as the rod is slid downwardly through the cover top assembly to free the sponge of the squeezing cup, to permit the hand to hold the cover top assembly elevated upon the upper end of the rod and providing a unitary handle therewith.

2,774,094
**LIQUID APPLICATOR FOR PACKAGING MACHINES AND THE LIKE**
Robert Rutherford, Springfield, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application May 16, 1951, Serial No. 226,566
1 Claim. (Cl. 15—127)

An applicator for controlled continuous application of liquid to surfaces moving relatively thereto, the same comprising an elongated open-bottomed housing the top of which is provided with a constantly open orifice for continuous inflow of liquid, a pad and above it a pervious liquid distributor closing the bottom of the housing, clamping bars extending along the bottoms of the side walls of the housing and confining said pad against said distributor and said distributor against shoulders formed on said side walls, the space between the distributor and the top of the housing forming a reservoir adapted to be completely and continuously filled by the continuous inflowing liquid; the pad, secured to the housing as specified, projecting below the housing, and a fabric sheet for contact with said moving surface extending under the pad and under the clamping bars with its longitudinal edges secured to the opposite longitudinal walls of the housing.

2,774,095
**APPARATUS FOR TREATING HAIR WITH LIQUIDS**
Sven Martin Berg, Lidingo, Sweden
Application March 23, 1953, Serial No. 343,981
Claims priority, application Sweden March 28, 1952
2 Claims. (Cl. 15—137)

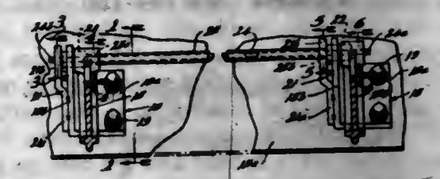
1. Apparatus for treating hair with liquids comprising an elongated casing of rigid material, said casing enclosing a cylindrical space extending longitudinally of the casing adapted to serve both as a reservoir for the liquid and a pump cylinder, a piston slidable in said cylinder, an inlet for air to one end portion of said cylinder at one side of said piston, an outlet for liquid from the opposite end portion of said cylinder at the other side of said piston, an elongated bladder extending along the side of said casing constituting an air pump and adapted to be actuated by the fingers of the hand in which the apparatus is held, an air channel between the compressed air outlet of said bladder and the air inlet to said cylinder, a liquid distributing finger extending from one end of said casing, said finger being provided with a channel for distributing the liquid, a liquid channel extending between the liquid outlet from said pump cylinder and said channel in said finger, valve means in said liquid channel between said liquid outlet from said pump cylinder and said channel in said finger, and means adapted to be actuated by the thumb of the hand in which the apparatus is held for controlling operation of said valve means, said thumb actuated valve controlling means and said bladder being disposed on opposite sides respectively of a longitudinal plane through the axis of said pump cylinder.



2,774,096
**COLLAPSIBLE BRUSHES**
Michael Everard Taylor, Iver Heath, England, assignor to Twinco Limited, Birmingham, England, a British company
Application May 23, 1955, Serial No. 510,411
Claims priority, application Great Britain May 27, 1954
3 Claims. (Cl. 15—203)

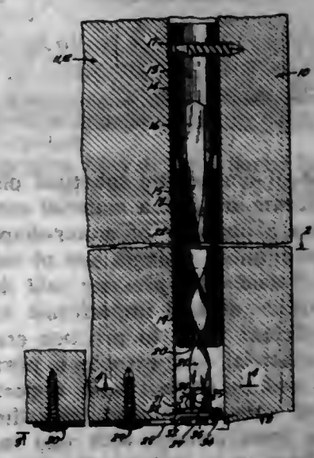
1. A collapsible brush comprising a shallow channel-like brush back having parallel flanges substantially perpendicular to a base part, bearings in the flanges, elongated bristle mounts having trunnions at their ends which are rotatably received in the bearings, bristles mounted on the bristle mounts and movable on rotation of the trunnions in their bearings between a position of use in which they extend substantially perpendicular to the base part and a recumbent position in which they lie substantially flat upon the base part, surfaces on the bristle mounts eccentric to the axes of their trunnions, a slideway between the bristle mounts and base part of the brush back and a slider for insertion in the slideway where it comes into engagement with said eccentric surfaces of the bristle mounts which in cooperation with the slider rotate the mounts to raise the bristles and securely anchor the bristle mounts in the position of use, guide means in the flanges of the brush back above the bristle mounts whereby the slider when removed from the slideway may alternatively be inserted in said guide means to turn back the bristle mounts and form a cover for the brush back with the bristles in the recumbent position.

2,774,097
**SHOE SHINING STAND**
Karl T. Lehmann, St. Charles, Mo.
Application October 18, 1952, Serial No. 315,488
1 Claim. (Cl. 15—267)



In combination with an angle iron bed rail having a horizontal part and a vertical part depending from the outboard edge of said horizontal part, a shoe shining stand removably mounted on said rail and comprising a one piece mounting bracket having a pair of legs and a flat-surfaced web connecting said legs, said web engaging the upper surface of the horizontal part of said rail, one of said legs forming a reentrant angle with the web and engaging the inboard edge of said horizontal part, and the other of said legs engaging the outboard surface of said vertical part, said other leg having at its lower end an outwardly, horizontally extending platform; a separate shoe-sole shaped shoe support; means engaged with the heel section of the said shoe support for removably mounting the said shoe support on the said platform, and clamping means having a threaded member extending laterally through the heel section of the said support and carrying oppositely disposed heel gripping plates, said clamping means being unconnected to the said mounting bracket.

2,774,098
**OPHTHALMIC MOUNTING HINGE**
Arthur J. Tieri, Worcester, Mass.
Application August 19, 1952, Serial No. 305,107
4 Claims. (Cl. 16—128)

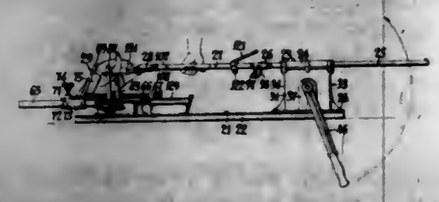


1. In a hinge assembly, a pair of spaced parts formed with aligned openings the walls forming said openings each flaring outwardly throughout its length to form inwardly tapered conical seats, an intermediate body member formed with a cylindrical opening axially aligned with the openings in said spaced parts, the opening in said intermediate body member having the same diameter throughout its length as the minimum diameter of said flared openings, a deformable tubular hinge member arranged in said aligned openings, said hinge member having a uniform outer diameter throughout its length and having one end portion with its inner wall surface converging at approximately the angle of one of said conical seats, and a core member for axial movement into said tubular hinge member, said core member having an outwardly flared conical end of such dimension as to expand one end of the deformable hinge member snugly into its conical seat, the other end of said core member having such a diameter as to urge the converging inner wall of the hinge member snugly into its conical seat.

2,774,099
**HOOD OR DECK LID HINGE**
Gerald R. Thomas, St. Clair Shores, Mich., assignor, by mesne assignments, to Chrysler Corporation, a corporation of Delaware
Application September 4, 1953, Serial No. 378,524
4 Claims. (Cl. 16—180)

1. In a vehicle body having an up and down swinging lid or closure, a pair of transversely spaced supports fixed to the body, a pair of transversely spaced hinge members pivotally mounted on said supports to swing about a common transverse axis, each of said hinge members being attached to the lid or closure to provide for up and down swinging movement thereof, torsional spring means comprising a torsion tube and a torsion bar extending coaxially therethrough and along the axis of said hinge members, said torsion tube being attached coaxially adjacent one end to one hinge member and coaxially adjacent its opposite end to one of said supports, said torsion bar being attached coaxially adjacent one end to the other hinge member and coaxially adjacent its opposite end to the other support, said torsional spring means being initially torsionally deflected to exert turning effort on said hinge members tending to swing the lid upwardly toward open position.

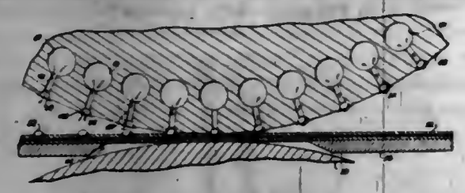
2,774,100
**ADJUSTABLE SPRING SASH BALANCE**
Algot Larson, Stamford, Conn., and Howard A. Smith, Chicago, Ill., assignors to Unique Balance Co., Inc., New York, N. Y., a corporation of Illinois
Application August 30, 1952, Serial No. 307,232
6 Claims. (Cl. 16—197)



1. In a window sash balance, mechanism for adjusting the angular position of the spiral rod which determines

the tension of the power spring, said mechanism comprising, a sash attachment plate having one end formed to define an elongated slot therein, a post received within the slot and adapted to have the lower end of the rod secured thereto, said post having an annular groove therein on one side of the slot, ratchet and pawl mechanism having the two component parts thereof respectively secured to said post and to said plate at the inner end of said slot, a tension spring with one end anchored to said plate at the inner end of said slot and the other end received in said groove, said spring both locking said post in assembled position and urging said post towards the inner end of said slot to maintain said ratchet and pawl in engagement, and means to turn the post in the slot.

---

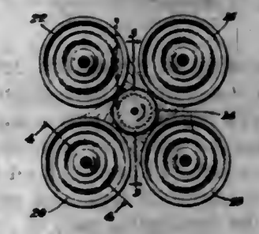


**2,774,101**
**EVISCERATING APPARATUS FOR POULTRY**
**Stephen J. Ograbisz, Hamburg, N. Y.**
**Application October 4, 1954, Serial No. 460,213**
**5 Claims. (Cl. 17—11)**

1. An eviscerating machine comprising a stage for supporting a carcass, an arm, mechanism for moving the arm linearly toward and away from the stage, a pivotal connection between the arm and mechanism for arcuate movement of the arm in a vertical plane, a claw pivotally mounted on the end of the arm adjacent the stage for arcuate movement in a vertical plane and downwardly toward said stage, yieldable means interconnecting the arm and claw and normally holding the claw in an outstretched position with respect to the arm, said claw being movable downwardly by extraneous pressure applied to the surface thereof, and a latching device between the arm and claw for holding the claw in an angular position with respect to the arm when the claw has been rotated through a predetermined arc.

---

**2,774,102**
**BEAD SETTING METHOD AND APPARATUS**
**Jackson L. Campbell, Cleveland, Ohio, assignor, by mesne assignments, to General Electric Company, a corporation of New York**
**Application April 15, 1946, Serial No. 662,373**
**15 Claims. (Cl. 18—1)**



1. The method of embedding spherical objects in the surface of imperforate areas of a material comprising the steps of, providing a plurality of crater-shaped material extruding dies, positioning a single one of said spherical objects in each of said dies, pressing said dies and objects into the surface of said imperforate areas of the material with sufficient force to produce craters in the surface of said material and extrude a portion of the material around and in contact with a portion of the periphery of each spherical object, and thereafter removing said dies from contact with said material and said spherical objects so as to leave the latter embedded in the craters and held by the said extruded portions of the material.

5. An apparatus of the character described comprising, a supporting framework, a roll journalled in said framework, said roll having a plurality of spaced openings in the circumference thereof, a plurality of material extruding dies on the circumference of the roll, there being one of said dies surrounding each of said openings, means for supplying a plurality of spherical objects to the circumference of said roll, means cooperating with the openings in said roll to retain one of said spherical objects in each of said openings during a portion of each revolution of the roll, means cooperating with said roll and adapted to support a sheet of material in intimate contact with a portion of the circumference of the roll, and means to rotate said roll, whereby a sheet of material presented to said roll and the means cooperating with the circumference thereof will be moved therebetween by the rotation of said roll, so that the spherical objects carried by the roll will be pressed into a surface of the said sheet of material, and the die surrounding each opening in the roll will extrude a portion of the material of the sheet around and into contact with a portion of the periphery of the corresponding spherical object.

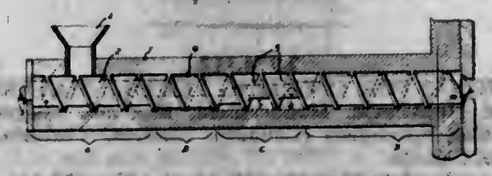
**2,774,103**
**APPARATUS FOR FIBERIZING MOLTEN MATERIAL**
**Bruce A. Graybeal, Dover, N. J.**
**Application July 22, 1955, Serial No. 523,906**
**3 Claims. (Cl. 18—2.6)**

2. A fiberizing rotor assembly consisting of a central rotor, at least three symmetrically mounted, symmetrically shaped fiberizing rotors adjacent to and equally spaced from said central rotor, means to drive said central rotor, and means to drive each of the fiberizing rotors, each of said fiberizing rotors having a corrugated disc body.

---

**2,774,104**
**MOLDING AND DISPENSING OF PLASTIC MATERIALS**
**Bruce D. Miller, Louisville, Ky., assignor, by mesne assignments, to National Cylinder Gas Company, Chicago, Ill., a corporation of Delaware**
**Application July 15, 1952, Serial No. 298,912**
**11 Claims. (Cl. 18—5)**



1. In a machine for molding and dispensing plastic material, the combination of a mold adapted to receive therein the plastic material and having an outlet, conveyor means adapted to be advanced step-by-step past the outlet of said mold, means for expelling a predetermined quantity of the plastic material from the outlet of said mold, cutting means movable across the outlet of said mold in a path substantially parallel to said conveyor means for detaching the predetermined quantity of plastic material expelled from said mold, and means cooperating with said conveyor means for lifting the conveyor means into adhesive contact with the predetermined quantity of material expelled to support the latter as it is being detached between advancement steps of said conveyor means in avoidance of deformation of the expelled material.

**2,774,105**
**EXTRACTION-EXTRUSION APPARATUS**
**Ernest C. Bernhardt, Montclair, N. J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware**
**Application April 27, 1954, Serial No. 425,985**
**3 Claims. (Cl. 18—12)**

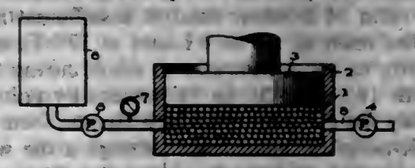
1. An extrusion-extraction apparatus for removing volatile component from a mixture of a plastic material containing said volatile component, comprising a cylindrical barrel, a helical screw conveying device rotatably mounted in said barrel and a means for driving said screw conveying device, said screw having a zone of greater drag-flow capacity following a throttling zone of lesser drag flow capacity, said screw having a hollow core communicating with the said zone of greater drag-flow capacity, and with a means for applying a vacuum thereto, said communication being positioned in the forward half of the zone of greater drag-flow capacity, and in the forward half of a channel between threads in the said zone.

---

**2,774,106**
**METHOD OF AND APPARATUS FOR FORMING A SHEET OF LATEX FOAM**
**Eugene J. Bethe, Mishawaka, Ind., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey**
**Application December 17, 1952, Serial No. 326,505**
**6 Claims. (Cl. 18—12)**

1. Apparatus for forming a flat sheet of liquid foam that is uniform as to thickness, comprising an extruding nozzle for extruding freshly formed liquid foam, a source of foam under a number of pounds of pressure operatively connected to the nozzle, said nozzle having a tubular foam-receiving portion and an outwardly-flaring wide discharge portion of much greater cross-sectional area than said receiving portion and having spaced side walls and continuously diverging edge walls that connect the side walls and a curved outer end the entire curve of which lies an equal distance from a plane extending transversely to the base of said outwardly-flaring portion so that each portion of the foam stream leaves the nozzle under uniform pressure, and a traveling belt positioned to receive the foam stream as it leaves the nozzle.

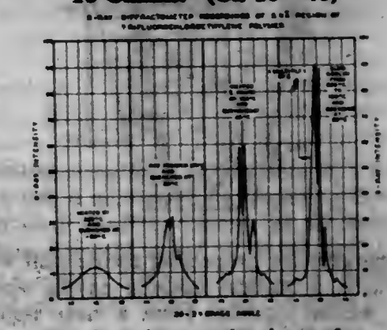
---



**2,774,107**
**EXTRUSION APPARATUS**
**Benjamin H. Davis, Noank, Conn., assignor to The Standard Machinery Company, Mystic, Conn., a corporation of Connecticut**
**Application October 15, 1954, Serial No. 462,537**
**7 Claims. (Cl. 18—12)**

7. In extrusion apparatus, the combination of a substantially horizontal extrusion cylinder having a surrounding cylindrical jacket body in heat exchange relation therewith and external circumferential cooling ribs of substantially uniform height on said body substantially over the longitudinal extent of the latter; and a cylindrical cover surrounding said jacket body substantially throughout the longitudinal extent of said ribs and being arranged eccentrically with respect to said jacket body so as to be spaced progressively closer from said ribs from the bottom side of said cover toward the top side thereof, said cover having closed ends and two airports extending on said top and bottom sides, respectively, of the cover substantially throughout the longitudinal extent of the latter.

---



**2,774,108**
**METHOD OF MAKING LOW-RESISTANCE ION-EXCHANGE MEMBRANES**
**Malcolm R. J. Wyllie, Indiana Township, Allegheny County, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware**
**Application September 16, 1952, Serial No. 309,760**
**6 Claims. (Cl. 18—47.5)**

1. A process of preparing an electrolytically-conducting membrane having ion-exchange properties which comprises compacting a finely-divided ion-exchange material to reduce the interstitial voids between particles to less than 25 percent of the total volume, and, while maintaining the particles in compacted form, evacuating the interstitial voids between said compacted particles, filling the interstitial voids with an electrically-insulating polymerizable resinous liquid, and effecting polymerization of said liquid.

**2,774,109**
**HEAT TREATING PROCESS FOR TRIFLUORO-CHLOROETHYLENE POLYMERS**
**Herman S. Kaufman, New York, N. Y., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware**
**Application May 6, 1953, Serial No. 353,393**
**18 Claims. (Cl. 18—48)**

1. A process for the production of an amorphous

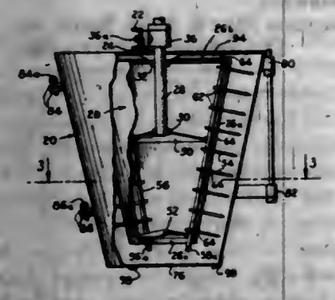
polymer of trifluorochloroethylene which comprises heating a thermoplastic polymer of trifluorochloroethylene above its transition temperature and subsequently immersing said heated polymer while at a temperature above its transition temperature in a cooling media maintained at a temperature not higher than —30° C.

2,774,110

## METHOD OF EXTRUSION OF FURANE RESINS

Joseph M. Walters, Allentown, Pa., assignor to Electro Chemical Engineering & Manufacturing Company, Emmaus, Pa., a corporation of Delaware

Application July 19, 1954, Serial No. 444,319
1 Claim. (Cl. 18—55)



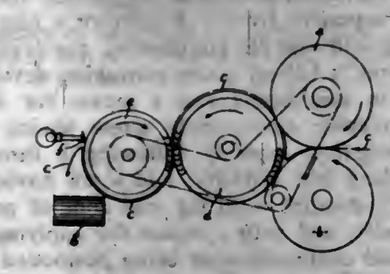
The process of extruding a furane resinous composition, which comprises mixing at a temperature consistently maintained below 100° F. (*a*) a furane resin having a viscosity between 15 and 5000 centipoises when measured at 77° F. and selected from the class consisting of polyfurfuryl alcohol, polymerizable mixtures of furfuryl alcohol and not more than 15 percent by weight of furfural, polymerizable mixtures of furfuryl alcohol and formaldehyde in molar ratios of between 1 to 0.5 and 1 to 3, and polymerizable mixtures of ketone and furfural in molar ratios of between 1 to 1 and 1 to 8, the ketone having at least two hydrogen atoms on an alpha carbon and having groups of the class of alkyl and ethylenic groups each of carbon chain length not in excess of four, with (*b*) between 1 and 15 percent on the weight of the resin of a latent catalyst insufficient in activity to cause the resin to set in 4 hours at 77° F. and sufficient in activity to cause the resin to set at curing temperature, and with (*c*) from 50 to 71 percent by volume of filler, extruding the composition which has the form of slurry of solid particles in liquid resin through a die while cooling the composition and maintaining the temperature below 120° F., accepting the extrusion beyond the die in an acid liquid which is within ±10 percent of the specific gravity of the extrusion and free from soluble attack on the extrusion, the extrusion remaining as a solid in the extruded form in the acceptance liquid and the acceptance liquid serving to reduce the forces tending to distort the solid extrusion, and curing the extrusion thus formed at elevated temperature.

2,774,111

## THREAD REMOVING APPARATUS

Charles S. Allen, Jr., Greenville, S. C.

Application August 16, 1954, Serial No. 450,187
5 Claims. (Cl. 19—90)



1. An apparatus for processing textile mill waste comprising a frame, a vertical housing having walls of circular cross section tapering from a large upper end to a relatively small lower end mounted within said frame, a rotatable element of substantially conical configuration positioned within and spaced from said housing so as to form a passageway between the housing and the rotatable element, a plurality of spaced shafts rotatably mounted within said rotatable element, a plurality of spaced beaters fixedly mounted on said shafts projecting outwardly from the rotatable element through slots therein, means for turning said shafts so as to withdraw the beaters entirely within the conical element, a hopper adjacent the small end of the housing for introducing waste into the space between the housing and the conical element, means adjacent the large end of the housing for removing the processed waste and hinge means for opening a section of the housing for removing the threads which have been built up on the conical element by pulling the threads off the small end of the conical element after the beaters have been withdrawn.

2,774,112

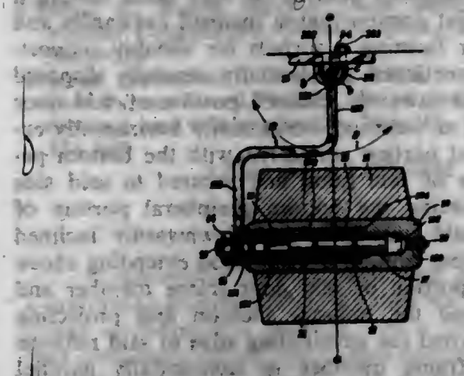
## MACHINES FOR TREATING TEXTILE MATERIALS

Harold Hopkinson, Huddersfield, England, assignor to Carding Specialists (Canada), Limited, Toronto, Ontario, Canada

Application May 13, 1954, Serial No. 429,641
2 Claims. (Cl. 19—106)

1. In a carding engine, the combination of a pair of upper and lower pressure rollers mounted for rotation in relatively opposite directions for passage of a web of fibres between them, a card clothed doffer roller having a side thereof in close proximity to a side of the lower pressure roller and having means for rotating it at a surface speed greater than that of the lower pressure roller and in a direction to carry the web upwardly therefrom, the doffer roller having teeth pointing opposite to their direction of rotation, a card clothed stripper roller having a side thereof in close proximity to a side of the doffer roller and rotating in a direction opposite to the direction of rotation of the doffer roller and at a lower surface speed than that of the doffer roller, the stripper roller having teeth pointing opposite to their direction of rotation to receive between its teeth fibres thrown from the doffer roller and to carry the fibres downwardly and forwardly, and means at the forward side of the stripper roller for removing the web of fibres therefrom.

2,774,113

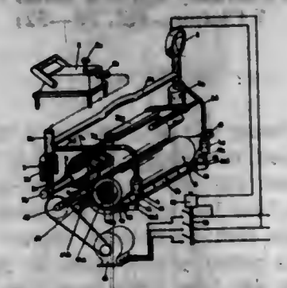


## TOP ROLL SUPPORT FOR DRAWING MECHANISMS OF TEXTILE MACHINES

Bertil Johansson, Goteborg, Sweden, assignor to SKF Kugellagerfabriken Gesellschaft mit beschränkter Haftung, Schweinfurt, Germany

Application October 7, 1953, Serial No. 384,672
8 Claims. (Cl. 19—142)

1. In a drawing mechanism for spinning machines, in combination, top roll means formed with an axial bore; bearing means located in said bore to support said top roll means for free rotation about its axis; a shaft fixed to said bearing means and extending through one end of said axial bore beyond said top roll means; an elongated guide arm having an intermediate substantially straight portion and a pair of opposite substantially straight end portions substantially perpendicular to said intermediate portion and extending in opposite directions from opposite ends of said intermediate portion, respectively, one of said end portions having a free end located opposite said one end of said bore and fixed to said shaft, and said intermediate portion being located opposite the outer working face of said top roll means, being substantially parallel to the axis of said top roll means, and extending



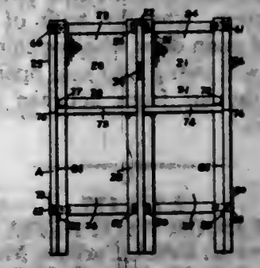
up to a substantially central plane of said top roll means normal to said axis thereof, the other of said end portions of said arm being located in said plane and having a free end formed with a cutout passing therethrough; a substantially U-shaped rod having a central curved portion passing through said cutout; and a stationary frame part fixed to and carrying said rod.

2,774,114

## MECHANISM FOR A TEXTILE MACHINE

Jean Marc Barnabé Gonay, Verviers, Belgium

Application October 16, 1952, Serial No. 315,152
Claims priority, application Belgium October 26, 1951
1 Claim. (Cl. 19—165)



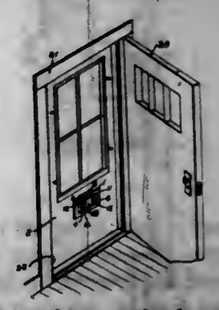
A gill-box mechanism comprising a conduit for supplying fluid under pressure, a pump feeding the fluid into the conduit, pressure cylinders communicating with the conduit and having pistons reciprocable therein, rods connected to the pistons, a shaft interconnecting the rods and movable therewith, anti-friction bearings mounted on the shaft, a pressure roller journalled in the bearings, branch-ducts connected to the conduit, auxiliary cylinders communicating with the branch-ducts and having control pistons reciprocable therein, control rods connected to the control pistons, pivoted rocker arms operatively contacting the distal ends of the control rods, a draft roller cooperating with the pressure roller, a counter-pressure roller cooperating with the pressure and draft rollers, drive means for the draft roller, a plate mounted on the rocker arms and having curved portions contacting the surfaces of the draft and counter-pressure rollers remote from the pressure roller, and pressure-sensitive control means to cut off the supply of power to the drive means responsive to increase of pressure in the conduit upon displacement of the plate from contact with the draft and counter-pressure rollers by the passage of an excessive amount of treated material therebetween therewith displacing the control rods in a direction to increase pressure in the branch-ducts and conduit.

2,774,115

## UNITARY FOLDING VOTING BOOTH

James Derderian and Everett Vernon Sanborn, Methuen, Mass.

Application March 18, 1954, Serial No. 417,109
5 Claims. (Cl. 20—3)



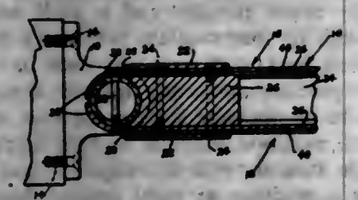
1. A two compartment, unitary, folding voting booth comprising a central upstanding partition member having a panel in its upper portion and a shelf end receiving opening through its intermediate portion; a pair of identical upstanding back wall members each having a panel in its upper portion and each hinged along its inner vertical edge to an opposite side of the rear vertical edge of said central partition member to fold from a position with its inside face flatwise thereagainst and parallel to the other to a position at right angles thereto and in extension of the other; a pair of identical, upstanding end wall members each having a panel in its upper portion and a shelf receiving opening in its lower portion, each end wall member being hinged along its inner vertical edge to the outer vertical edge of one of said back wall members to fold from a position with its outer face flatwise against the outer face of said back member through an angle of about 270° to a position with its inner face at right angles to the inner face of said back wall member; a pair of identical shelves, each hinged along the lower edge of the upper panel of one of said end wall members to fold from a depending position wholly within the shelf receiving opening of said end wall member upwardly toward the other to a horizontal position in extension thereof and with the free terminal ends of said shelves substantially abutting against each other in the shelf end receiving opening of said central partition member and latching means mounted on said central partition member for supporting the free ends of said shelves in a horizontal plane and retaining said free ends against movement away from each other in said horizontal plane.

2,774,116

## DOUBLE ACTING RELIEF VALVE

Percy B. Wolverton, Kansas City, Kans.

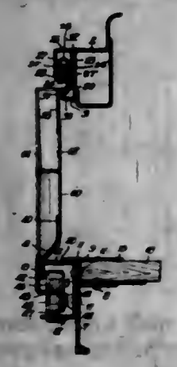
Application August 11, 1954, Serial No. 449,125
2 Claims. (Cl. 20—16)



1. In combination with a main door of a building structure and a storm door having an opening therein exteriorly of said main door for passage of air therethrough entrapped between said doors, a double acting relief valve comprising a plate having an opening therein hinged to the inner face of the storm door covering the opening in the storm door, ears projecting from the plate, curved

arms pivotally connected to said ears and extending through the opening in said plate, a second plate secured to the free ends of said arms and covering the opening in the first named plate and swingable in said opening in the storm door, said last named plate comprising a valve and seating against the inside of the first named plate around said opening therein, whereby both of said plates will swing toward said main door when opening said doors and the second plate will swing into said opening in the storm door to relieve the air from between said doors upon closing said doors.

---



2,774,117
**RESILIENT DOOR WITH OFFSET MOUNT**
Oliver C. Eckel, Carlisle, Mass.
Application July 20, 1955, Serial No. 523,326
4 Claims. (Cl. 20—16)

1. Door apparatus comprising a door body, door mount means embodying retaining portions at opposite faces of said door body having curved portions spaced apart and extending towards each other and providing an opening therebetween, a pivot member extending into said opening, means fastening said pivot member to said curved portions, two attaching portions, two offset portions connecting said retaining portions and said attaching portions and extending outwardly in offset relationship to said retaining portions, means fastening said attaching portions to said door body, a casing member having a portion extending from a point opposite and under a said attaching portion along a face of said door body, and another portion along the opposite face of said door body to a point opposite and under the other said attaching portion, a wear strip having a portion extending from a point opposite and under a said attaching portion along a face of said door body and a portion extending along the opposite face of said door body to a point opposite and under the other said attaching portion.

---

2,774,118
**SIDE DOOR FOR RAILWAY CARS**
Karl F. Nystrom, Chicago, Ill., assignor to Standard Railway Equipment Manufacturing Company, Chicago, Ill., a corporation of Delaware
Application August 4, 1950, Serial No. 177,671
5 Claims. (Cl. 20—22)

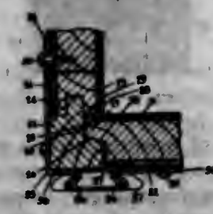
1. In a hood structure for a vertically shiftable and laterally movable door for a railway car wall having a door frame therein wherein the door terminates in a door frame member including a substantially centrally disposed downwardly and inwardly inclined portion, the top marginal periphery of said door frame member terminating in an outwardly and downwardly extending U-shaped portion having a reflange disposed in substantially parallel spaced relation to the plane of said door frame member, a side plate, a hood having a vertically disposed central portion supported on said side plate, said vertically disposed portion of said hood having a bottom peripheral portion that is inclined outwardly and downwardly for forming a surface for slidably supporting said aforementioned substantially centrally disposed downwardly and inwardly inclined portion of said door frame member, an inturned substantially horizontally extending marginal portion connected with the bottom peripheral portion of said hood and secured to said side plate for supporting the bottom peripheral portion of said hood in said outwardly and downwardly inclined position, the upper portion of said hood extending above said U-shaped portion of said door frame member and over and beyond the reflange thereon and projecting downwardly beyond the terminating edge of said reflange on said door frame member in substantially parallel spaced vertical relation thereto, the said downwardly extending portion of said hood being reversed upon itself and extending upwardly in spaced parallel relation to said door frame member in a reflange engaging the reflange of said door frame member and supporting said door frame member in a position free to shift vertically while moving laterally as the inclined surface on said door frame member slides outwardly or inwardly on the supporting inclined surface on said hood in relation to the door frame in the car wall.

---

2,774,119
**SPRING SASH BALANCE**
Fred C. Osten, Detroit, Mich.
Application February 8, 1954, Serial No. 408,939
7 Claims. (Cl. 20—52)

1. A combination sash balance and hollow channel sash guide for an edge-grooved vertically-sliding window sash, comprising an elongated hollow channel structure including a hollow front rib having an elongated recess in the back thereof, elongated front flanges extending laterally in opposite directions away from said rib, and elongated side flanges extending rearwardly away from said front flanges, said rib guidingly engaging an edge groove of said sash in sliding relationship therewith, a sash balancing spring anchorage secured to the upper portion of said channel structure, balancing spring means mounted within said channel structure and depending from said spring anchorage, lower and upper pulleys rotatably mounted in vertically-spaced relationship at substantially stationary locations in said recess within said rib, an elongated flexible force-transmitting member secured at its inner end to said spring means and extending around said pulleys outwardly through an opening in said rib, and a sash attachment element secured to the outer end of said flexible member.

---

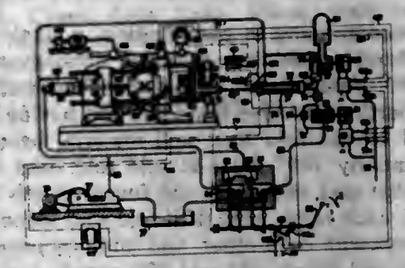


2,774,120
**SEALING STRIP FOR REFRIGERATOR DOOR**
Charles H. Beare, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Original application February 6, 1951, Serial No. 209,624, now Patent No. 2,716,778, dated September 6, 1955. Divided and this application May 13, 1953, Serial No. 354,859
3 Claims. (Cl. 20—69)

1. A rubber-like cushioning sealing strip comprising; a preformed seamless relatively thin walled outer hollow casing of rubber-like material, and a foam latex rubber core completely filling said hollow casing, said core being completely encased, formed and shaped in situ in said casing for providing a support for said casing and having contacting surface portions bonded thereto.

---

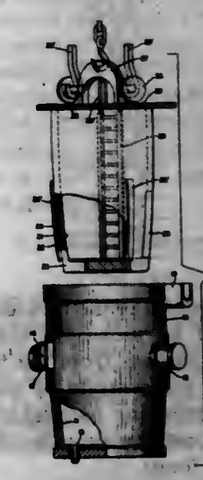
2,774,121
**JOINT FOR STRUCTURAL SECTIONS**
Henry Ludwig Graevenitz and Frederick Stanley Dunham, East Orange, N. J., assignors to Otis Elevator Company, New York, N. Y., a corporation of New Jersey
Application February 24, 1951, Serial No. 212,618
3 Claims. (Cl. 20—92)



1. A joint for a pair of adjacent panels arranged at a right angle to each other, said joint being between the edge of one of said panels and the inner face of the other of said panels at the edge of said other panel and comprising; a tongue formed on said edge of said one panel, one side of said tongue being in line with the inner face of said one panel and the other side being at an obtuse angle to said edge of said one panel, said inner face of said other of said panels adjacent said edge of said other panel having a groove formed therein into which said tongue extends, the side of said groove opposite said inner face of said one panel being in line with said inner face of said one panel and the other side of said groove being at an angle conforming to that of said other side of said tongue, said groove being narrower than said tongue and thus providing clearance between said end of said tongue and the bottom of said groove and between said edge of said one panel and said inner face of said other panel outside said tongue and groove when said tongue is wedged in said groove; and clamping means on said panels securing said panels together in said tongue and groove relationship with a wedge-like action, insuring a tight fit of said panels at the point of joinder.

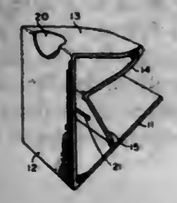
---

2,774,122
**DIE-CASTING MACHINE**
Fritz Hodler, Territet, Switzerland
Application February 5, 1953, Serial No. 335,215
Claims priority, application Switzerland February 7, 1952
8 Claims. (Cl. 22—68)



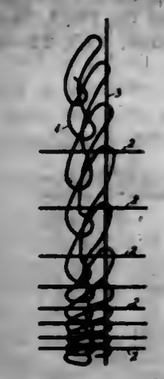
1. An apparatus for injecting casting material into a die, said apparatus comprising an injection cylinder; an injection plunger; an hydraulically operated piston actuating said injection plunger to deliver shots of molten casting material from the injection cylinder to the die; a first feedline feeding hydraulic fluid under pressure to said piston; a regulating valve in said feedline for supplying to said piston hydraulic fluid at a rate sufficient only to advance said piston in a first operative main phase; a second feedline feeding hydraulic fluid to said piston, said second feedline bypassing said first feedline and allowing passage of hydraulic fluid sufficient to drive the piston at high speed for a second operative main phase of rapid shot

injection; a valve in said second feedline; an electromagnet actuating said valve; a suction pump for withdrawing air from the die, an air suction conduit connecting the die cavity with said pump; a valve controlling the opening of said conduit into the die cavity; a pressure indicating device in said conduit; an electric circuit connecting said pressure indicating device with said electro-magnet actuating said valve in said second feedline; and means on said pressure indicating device closing said circuit at a predetermined vacuum indicated by said pressure indicating device and opening said valve in said second feedline to initiate a second phase of rapid shot injection.



---

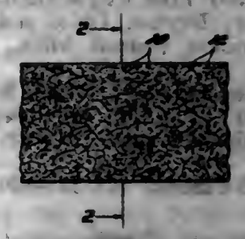
2,774,123
**LADLE MAINTENANCE APPARATUS**
June H. Reighart, Cleveland, Ohio
Application August 10, 1953, Serial No. 373,118
3 Claims. (Cl. 22—85)



1. A ladle insert for protecting a human operator from the heat of a ladle used for molten metal, and comprising the combination of bucket shaped inner and outer walls and heat insulating material between said walls around the sides of said insert and at the bottom thereof, a ladder extending down into the interior of said insert, a top platform extending from said ladder to a position adapted to overhang a side of the ladle, spacer guide ribs on the exterior of the shell for centering the shell within a ladle, and a door in said ladle insert for providing access thereto.

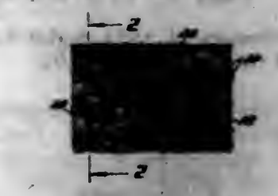
**2,774,124**
**CLIP**
Philip Brady, Dedham, Mass.
Application August 12, 1955, Serial No. 527,939
5 Claims. (Cl. 24—66)

1. A clip comprising in combination, a single strip of relatively flexible foldable material divided into first, second, third, fourth and fifth panels by first, second, third and fourth transverse fold lines and having an aperture at said second fold line, said material being folded with substantially 180° folds at said fold lines in directions such that said third and said fourth panels are contiguous with each other, said fifth and said second panels are contiguous with each other, and said first panel is contiguous with said fourth and said fifth panels, and a spring clip having two legs with rounded ends arranged through said aperture with one leg extending between said third and fourth panels and frictionally engaging said fourth panel and the other leg extending between said second and fifth panels and frictionally engaging said fifth panel, whereby the clip is adapted to receive material to be bound between said first and said fourth panels.



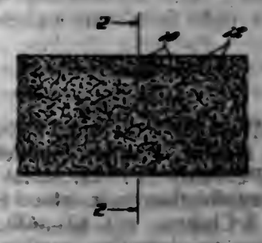
**2,774,125**
**METHOD OF SUPPORTING THREADS OR GROUPS OF THREADS IN A THREAD LAYER WHEN THE THREADS OR GROUPS OF THREADS ARE TO BE SEPARATED SINGLY FROM THE SAID LAYER**
Svend Sigurd Christie Fleischer, Charlottenlund, Denmark
Application June 4, 1954, Serial No. 434,572
3 Claims. (Cl. 28—22)

1. A method of supporting the threads of a thread layer which are held apart by means of thread loops during the separation of the threads from the thread layer, comprising the provision transversely of the thread layer of a supporting thread extending parallel to the row of loops and arranged to support the threads of the thread layer as well as the thread loops.



**2,774,126**
**PROCESS FOR MAKING FELT-LIKE PRODUCTS**
Horace A. Secrist, Dedham, Mass., assignor to The Kendall Company, Boston, Mass., a corporation of Massachusetts
Original application November 4, 1950, Serial No. 194,195. Divided and this application March 5, 1956, Serial No. 569,349
2 Claims. (Cl. 28—72.3)

1. The method of making an extensible, conformable, felt-like sheet material which comprises subjecting a body of cotton fibers intermingled with fibers having latent coalescent properties to the action of a liquid causticizing agent for cellulose at low temperature while supporting said body by means of said liquid agent substantially without tensional stress and surface frictional restraint, thereby causing said cotton fibers to kink, bend, twist and inter-



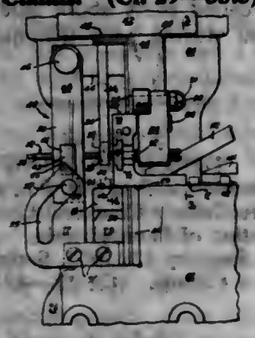
curl; and contract said body in area, and removing said causticizing agent from the fibers without substantially stretching said body, and thereafter activating the fibers having latent coalescent properties so as to bond the two types of fibers at some, at least, of their points of contact.

**2,774,127**
**TEXTILE SHEET MATERIAL**
Horace A. Secrist, Dedham, Mass., assignor to The Kendall Company, Boston, Mass., a corporation of Massachusetts
Application October 24, 1950, Serial No. 191,933
5 Claims. (Cl. 28—79)

1. As an article of manufacture, a unital, coherent, integrated, shrunken textile sheet material having substantial extensibility, conformability, integrity, and resilience and consisting essentially of cotton fibers spun into yarns and in apposition therewith unspun cotton fibers which are chemically swollen, said spun fibers and said unspun fibers being mutually integrated and frictionally interlocked by chemically induced permanent deformations of the said unspun fibers, said deformations being in the form of random kinks, bends, twists, and curls in substantially all three dimensions and being in excess of the deformations normally present in cotton fibers, the unspun fibers being entangled with themselves and with each other and with the spun fibers to which they are in apposition, the entanglement being substantially continuous and uniform throughout the sheet.

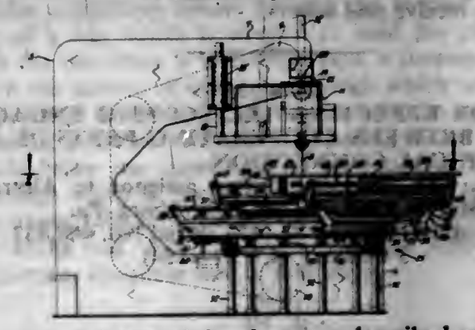
**2,774,128**
**FELT-LIKE PRODUCTS**
Horace A. Secrist, Dedham, Mass., assignor to The Kendall Company, Boston, Mass., a corporation of Massachusetts
Application November 4, 1950, Serial No. 194,195
1 Claim. (Cl. 28—79)

As an article of manufacture, a unitile, coherent, integrated, shrunken textile sheet material having substantial



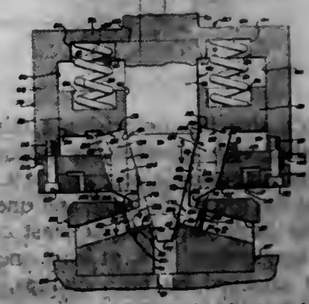
extensibility, conformability, integrity, and resilience and consisting essentially of fibers having latent coalescent properties and unspun cotton fibers, said unspun cotton fibers being chemically swollen, said fibers having latent coalescent properties and said unspun cotton fibers being mutually integrated and frictionally interlocked by chemically induced permanent deformations of said unspun cotton fibers, said deformations being in the form of random kinks, bends, twists, and curls in substantially all three-dimensional directions and being in excess of the deformations normally present in cotton fibers, the unspun cotton fibers being entangled with themselves and with each other and with said fibers having latent coalescent properties, the entanglement being substantially continuous and uniform throughout the sheet, said fibers having latent coalescent properties being adhesively bonded at some at least of their points of contact with each other and with said cotton fibers by the activation of their coalescent properties.

**2,774,129**
**SYNTHETIC FELTS**
Horace A. Secrist, Dedham, Mass., assignor to The Kendall Company, Boston, Mass., a corporation of Massachusetts
Application November 6, 1950, Serial No. 194,384
1 Claim. (Cl. 28—79)



A nonwoven fabric sheet composed essentially of unspun synthetic fibers held in a network relationship by the release of built-in potential energy of a curl and twist inducing nature, which results in fibers having artificially induced bends, twists, curls, writhes and gyrations which frictionally interlock to form a coherent fabric sheet structure which is primarily dependent for its integrity upon said interlock of said fibers.

**2,774,130**
**INSULATION STRIPPING APPLICATOR AND METHODS OF APPLICATION**
Earl E. Folkenroth, Harrisburg, Pa., assignor to Aircraft-Marine Products Inc., Harrisburg, Pa.
Application April 27, 1953, Serial No. 351,158
15 Claims. (Cl. 29—33.5)



1. A machine for applying connectors to the end of an insulated wire comprising wire insulation stripping means and connector crimping means both disposed closely adjacent in a single operating zone, operating ram means positioned to engage the crimping means and actuate it to crimp a connector positioned therein, means engaging said ram with said stripping means during a positive stroke of said ram before the dies are driven into crimping engagement with a connector, means to feed a connector into position for crimping by said crimping means, means to move a wire from the stripping position to the crimping position and insert its stripped end into a connector disposed in said crimping means, means actuated by said ram to operate said wire moving means during the same operating stroke of the ram means, but after the wire stripping means has been operated and prior to the crimping of said connector.

**2,774,131**
**METAL CUTTING BAND SAW WITH MANUALLY CONTROLLABLE POWER DRIVEN WORK FEED**
Robert L. Crane, Glen Lake, Minn., assignor to Continental Machines, Inc., Savage, Minn., a corporation of Minnesota
Application January 31, 1955, Serial No. 484,904
6 Claims. (Cl. 29—68)

1. A band saw of the character described comprising: a rigid C-shaped main frame having vertically spaced apart upper and lower arms defining a work zone therebetween; a saw band mounted in the main frame with a stretch thereof traveling downwardly through the work zone along a defined vertical path; a work supporting carriage upon which work to be cut may be mounted; means mounting the carriage for movement thereof in a horizontal plane above but adjacent to the lower arm of the main frame for feeding motion in a direction to carry work thereon against the cutting edge of said stretch of the saw band, and for swiveling motion in either direction about an axis substantially coincident with the cutting edge of said stretch of the saw band; an operator's platform vertically adjustably mounted on the main frame and disposed in front of the toothed edge of the saw band; power means for moving the work supporting carriage; control instrumentalities for governing said power means, said control instrumentalities including a manually operable control element on the operator's platform; and optical means mounted on the operator's platform and arranged to provide a view of the saw band at its actual point of entry into the work.

**2,774,132**
**METHOD OF MAKING ROLLER BEARING ROLLER RETAINERS**
John R. Squire, Grosse Pointe, Mich., assignor, by mesne assignments, to Federal-Mogul-Bower Bearings, Inc., Detroit, Mich., a corporation of Michigan
Application August 17, 1953, Serial No. 374,488
10 Claims. (Cl. 29—148.4)

1. A method of expanding, slotting and swaging a roller bearing roller retainer in a single substantially continuous

operation, said method comprising forming an open-centered frusto-conical shell corresponding in size and shape substantially to the size and shape of the completed retainer, placing said shell in a die having a cavity with a size and shape corresponding to the size and shape desired for the expanded shell and with apertures therein corresponding in size and shape to the slots desired in said retainer, forcibly expanding the side wall of said shell outwardly into contact with said die cavity, holding the thus expanded shell in said die cavity while forming multiple slots in said side wall of said shell at circumferentially-spaced locations, said slots corresponding in size and location to the size and location of the rollers in the assembled bearing, and continuing to hold the thus expanded and slotted shell in said die cavity while swaging the longitudinal edges of said slots to form approximate bevels thereon to receive said rollers.

---

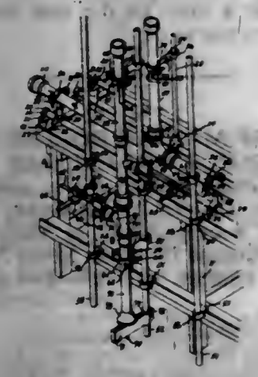
2,774,133

## TOOL FOR EFFECTING TELESCOPING ENGAGEMENT BETWEEN COOPERATING PARTS OF AN ELECTRICAL CONNECTION

Gilbert C. Sitz, Harrisburg, Pa., assignor to Aircraft-Marine Products, Inc., Harrisburg, Pa.

Application February 8, 1954, Serial No. 408,632
3 Claims. (Cl. 29—254)

1. A terminal applying tool comprising a shank having at its head end a terminal receiving longitudinal recess and an end wall defining the outer end of said recess, a slot extending through said end wall coaxially and connecting with said recess to form terminal engaging end flanges, and a wire receiving groove opening through a lateral wall portion of said head and into an inner end portion of said recess, said groove being angularly offset from said recess, said recess having a lateral opening extending between and connecting said slot and said groove.



---

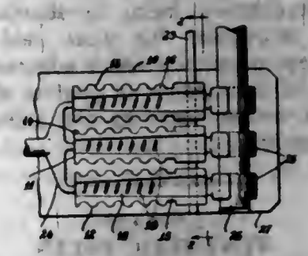
2,774,134

## PLUMBER'S PIPE JIG

John Lawrence Smith and Edwin Elmo McCartney, Memphis, Tenn.

Application October 22, 1953, Serial No. 387,732
2 Claims. (Cl. 29—286)

1. A plumber's pipe jig comprising a table, table supports for the table, two substantially horizontal parallel longitudinal rails supported along one side of the table, one rail adjacent the top of the table and one intermediate the height of the table supports, at least one adjustable clamp on each longitudinal rail, at least one substantially vertical support engaged by both clamps, two substantially horizontal parallel transverse rails supported on the top of the table and extending angularly to the longitudinal rails, at least one adjustable clamp on each transverse rail, at least one substantially horizontal support mounted in both transverse rail clamps, and at least one adjustable pipe clamp mounted on each of the vertical and horizontal supports.



---

2,774,135

## METHOD OF MAKING A MULTIPLE PART ANCHORAGE

Louis H. Morin, Bronx, N. Y.

Application September 22, 1952, Serial No. 310,903
2 Claims. (Cl. 29—417)

1. Method of continuously and successively forming multiple part anchor members on a continuous length of strand comprising moving a short length of said strand between a pair of relatively movable dies and adjacent a movable transfer core disposable between the dies, said dies having mating cavities for forming said parts, said short length being straight and having a free end disposed between said dies while the other end thereof extends beyond the dies and is integrally joined to said continuous length, closing the dies and casting a plurality of threaded parts in spaced side by side relation about said short length of strand by injecting casting material in one injection step to said dies, said short length becoming embedded in said parts, simultaneously forming on each part during said injection a lug portion in engagement with said transfer core, opening the dies, moving said parts and embedded length out of the dies by moving said transfer core and at the same time moving a succeeding short length of strand between the dies, partially closing the dies about the transfer core and stripping the latter from said lug portions, trimming said parts, severing the embedded length from said succeeding short length, moving said parts into a circumferential relation with respect to one another by bending the embedded length or portions thereof intermediate said parts, thereby forming an anchor member, and casting a succeeding plurality of threaded parts about said succeeding short length of strand during said trimming, severing, and bending steps.

---

2,774,136

## TORCH WELDING

William H. Schechter, Zelienople, Pa., assignor, by mesne assignments, to Callery Chemical Company, Pittsburgh, Pa., a corporation of Pennsylvania

Application January 13, 1953, Serial No. 330,947
6 Claims. (Cl. 29—494)

1. In a method of torch welding, the step of supplying flux to the flame comprising passing welding gas on its way to the torch into contact with solid product of reaction between ammonia and a lower alkyl borate.

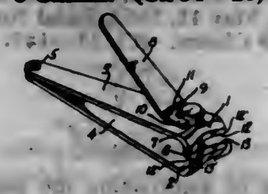
2,774,137

## METHOD AND FLUX FOR SOLDERING ALUMINUM

Max Yarow, Philadelphia, Pa.

No Drawing. Application August 4, 1953, Serial No. 372,403
4 Claims. (Cl. 29—495)

3. The method of soldering aluminum comprising cleaning the metal surface to be soldered, coating the clean aluminum surface with a flux consisting of 27 to 33% by weight of non-drying glyceride oil in which oleic acid is a predominantly fatty acid, a petroleum lubricating oil fraction having a viscosity of about 10 to 80 S. A. E. in proportion of about 24 to 36% by weight, the balance being rosin in proportion of about 30 to 40% by weight, and applying to said flux coated aluminum surface a molten solder composition comprising at least 35% tin, the balance being lead and usual impurities.



---

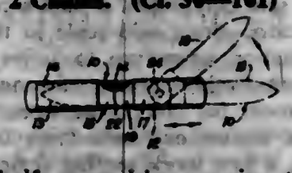
2,774,138

## NIPPER

Dwight M. Gowdey, Seattle, Wash.

Application September 3, 1954, Serial No. 454,074
5 Claims. (Cl. 30—28)

1. A digit nail nipper comprising jaws having cooperating cutting edges of reverse-curve profile, each cutting edge including a concave portion and a convex portion merging at a point, said concave and convex portions having their outer ends terminating abruptly in sharp corners, and such cooperating cutting edges of said nipper extending to such corners and adapted for engagement when said jaws are closed.



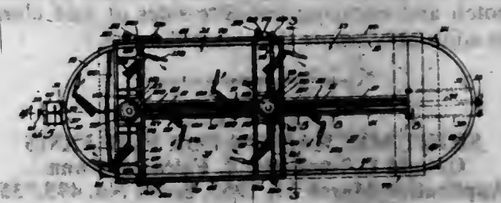
---

2,774,139

## POCKET KNIVES

Emil S. Polk, New York, N. Y.

Application May 31, 1952, Serial No. 291,030
2 Claims. (Cl. 30—161)



1. A pocket knife comprising a casing, the casing comprising spaced parallel side members and a bottom member integrally formed with the corresponding edges of the side members at one end, the casing having an open top and one open end and one closed end and a bottom opening adjacent the open end, a blade for the casing, means for pivotally securing the shank of the blade intermediate the side members adjacent said open end, a fixed U-shaped cover with open top disposed over a portion of the side and bottom members, the fixed cover having an inner end spaced from the open end of said casing a distance greater than twice the length of the shank of the blade, a slidable cover of U-shaped cross-section for the remainder of the side members in opposed relationship to the fixed cover, the slidable cover further having inwardly directed flanges over the open top of the casing, the U-shaped slidable cover further having formed in the bottom thereof a longitudinal slot coacting with the shank, and an inwardly directed stop disposed on the bottom of the slidable cover and adapted for engagement with an edge of the casing to prevent disengagement of the slidable cover.

## TRAVELING ROTARY VAT STRAINER

Aldo E. Nessler, Evanston, and Joseph G. Hartman, Wilmette, Ill., assignors to Kraft Foods Company, Chicago, Ill., a corporation of Delaware

Application October 12, 1954, Serial No. 461,724
13 Claims. (Cl. 31—48)

1. Apparatus adapted for use in draining free whey from cheese curd while said curd is in the form of discrete particles comprising means defining the bottom and side walls of a tray which is adapted to hold the curd from which the free whey is to be separated, a foraminous section in the bottom of said tray through which whey may be drained, a frame for supporting said tray in a generally horizontal position, said frame including means defining a guide below the upper edge of each side of said tray, a carriage which is supported on said guides for movement along said tray, means for reciprocating said carriage along said tray, and agitator means supported by said carriage to agitate curd in said tray.

---

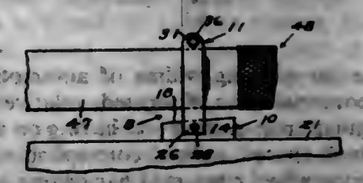
2,774,141

## PONTICS FOR DENTAL BRIDGES

William T. Quinn, Grosse Pointe, Mich.

Application March 23, 1953, Serial No. 343,946
8 Claims. (Cl. 32—6)

1. The method of constructing a dental bridge for anchorage to metallic holding means in space abutting teeth comprising as steps, the utilization of a preformed two piece pontic comprising a lower permanent tooth colored portion and an upper mating impermanent portion in interlocked engagement therewith, removing the latter and casting therefrom a metallic duplicate thereof, soldering said duplicate to the metallic holding means, and cementing the duplicate and permanent portions together.



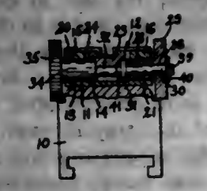
---

2,774,142

## TELESCOPE SIGHT MOUNT FOR FIREARMS WITH ELEVATION AND WINDAGE ADJUSTMENT MEANS

Ernest T. Lake and Robert R. Hardgrove, Livingston, Mont.

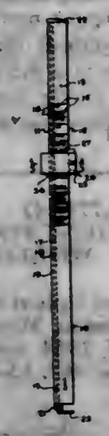
Application May 17, 1954, Serial No. 430,216
4 Claims. (Cl. 33—50)



1. In a telescopic sight mount for mounting a telescopic sight above a firearm portion and longitudinally thereof, a mounting unit including a base, means securing said base to a top portion of a firearm, said base comprising an elongated block adapted to be disposed longitudinally of the firearm and having a top face inclined from end-to-end thereof relative to the top portion of the firearm, said mounting unit including a clamp having an

opening in which an end portion of a telescopic sight barrel is adapted to be clamped, said clamp having a bottom portion provided with a downwardly opening notch loosely straddling the base and resting on the inclined top face thereof, set screws mounted in the bottom portion of said clamp and extending into opposite sides of said notch and engaging opposite sides of said elongated base to adjustably secure the clamp thereon.

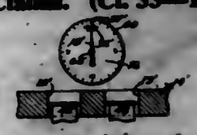
---



**2,774,143**
**SIGHT MECHANISM FOR FIREARMS**
**Oswald O. Sunderland, Fairfield, Conn.**
**Application March 21, 1955, Serial No. 495,735**
**10 Claims. (Cl. 33—56)**

6. A sight for firearms, said sight comprising a base, a horizontally disposed pivot pin carried thereby, a sight leaf mounted on said pin for pivotal movement about the axis of the pin and for lateral sliding movements, a shaft rotatably mounted in the base and disposed substantially parallel to said pivot pin, a cam on said shaft upon which said sight rests, means for rotating said shaft to move the leaf about its pivot, means for moving said shaft longitudinally of its axis with respect to the base, and means constraining said leaf to move with the shaft upon longitudinal movement of the latter, said last-named means comprising spaced abutments on the shaft between which a part of the leaf extends, and one of said abutments being on each side of said cam.

---

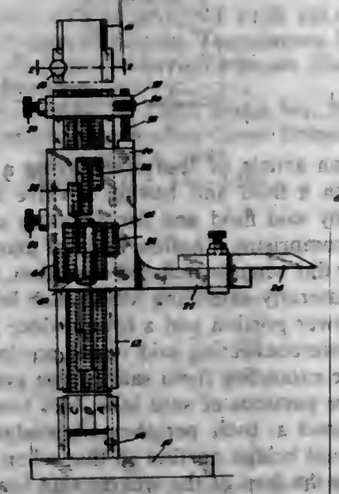


**2,774,144**
**WIDTH GAUGE FOR VEHICLE WHEEL RIMS**
**Charles Gilbertson Conger, Durham, N. C.**
**Application May 5, 1951, Serial No. 224,705**
**2 Claims. (Cl. 33—143)**

1. A device for gauging widths of automotive vehicle wheel rims, comprising an elongated, relatively thin flat bar of rectangular cross-section and having on at least one flat face thereof spaced indicia corresponding to given widths of various wheel rims, said bar having a groove of substantial depth opening laterally outwardly along the length of the edge thereof and defining spaced wall portions, an elongated rod of diameter approximating the width of said groove to be rotatably received within the same, means between said wall portions overlying said rod to retain the same rotatably within said groove, said rod having a gauging finger affixed thereon to be positioned at one end of the bar, said finger being of relatively narrow width not substantially exceeding the thickness of the bar and having a flat inwardly presented gauging face, means on said rod adjacent the other end of the bar for rotating the rod to swing said finger thereon from a retracted position in which it is superimposed with respect to said one end of the bar to a freely extended gauging position at an angle to the general plane of the bar and with said gauging face at right angles to said plane for engagement of the gauging face with one side portion of a rim, a member having a rectangular opening slidably receiving said bar and having thereon a second finger adapted to extend in the same direction as the freely-extended first-named finger and having a flat engaging face at right angles to said plane for engagement with an opposite side portion on the rim, and indicator means on said member and including an edge portion coordinated with the gauging face of said second finger for indicating on said indicia the corresponding width of a rim so engaged at opposite side portions by said gauging faces.

---

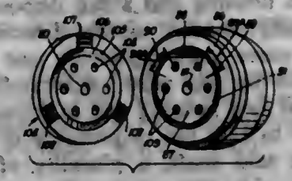
**2,774,145**
**CENTER SPACING TEST COMPARATOR AND METHOD**
**George E. Sorensen, Fairfield, Conn.**
**Application May 11, 1953, Serial No. 354,131**
**19 Claims. (Cl. 33—147)**



1. The method of ascertaining the measure of error between an unmeasurable spacing of hole centers in a work piece and a standard dimension with which said center spacing if accurate should accord, which includes the steps of, measuring at least a component of a first differential between said standard dimension and the distance separating two sides respectively of said holes, spacing off said component from a zero graduation on a half-value denominated over-and-under scale, positioning an indicator at the point on said scale arrived at by said spacing off step, doubling the distance of separation of said indicator and said zero graduation along said scale, measuring at least a component of a second differential between the distance that separates a different two sides respectively of said holes and said standard dimension, and spacing off said component of said second differential from said indicator along said scale in the direction of said zero graduation wherefore to arrive on said scale at a point quantitatively denoting said measure of error.

6. An instrument for comparing work center spacing with a standard dimension, embodying in combination, frame structure, a first work sensing feeler fixed on said frame structure, a second work sensing feeler carried by said frame structure in movable relation to said first feeler, an over-and-under scale carried by said frame in rotatably shiftable relation thereto and to said second feeler including a series of graduations extending in part in respectively opposite directions from a zero graduation on said scale, indicia on said scale respectively denominating said graduations as units of measurement progressively aggregated in each of said directions, an indicator carried by said frame structure in movable relation thereto and to said scale, connections between said indicator and said second feeler operative to transmit motion from the latter to the former in such ratio that said indicator performs increments of movement denoted on said scale by said indicia to be one half the true extent of corresponding increments of relative movement between said feelers, said connections including a motion transmitting coupling variable in dimension in a manner to alter simultaneous relative positions of said indicator and said second feeler, a marker operatively associated with said scale in a manner to be movable in unison with the shifting of said scale and also relatively to said scale, and means to shift said scale relatively to said frame structure and to said indicator independently of relative movement between said feelers.

---



**2,774,146**
**DIRECT-READING HEIGHT GAUGE**
**Roger T. McCoy, Indianapolis, Ind.**
**Application July 15, 1954, Serial No. 443,671**
**2 Claims. (Cl. 33—169)**

1. A direct-reading height gauge, comprising a base, a vertical rule adjustably carried by the base and carrying a plurality of scale-sets each having a pair of scales running upward and downward from a common zero point, with the zero points of said scale-sets at spaced points along the rule, means to secure the rule in adjusted position with its zero points at selected reference heights from the base, and a scribe-supporting saddle carrying reading indicia for each of said scales of said sets and cooperatively related thereto, said saddle being vertically movable with respect to the rule to carry said indicia in scale-reading relation both upward and downward along the scales from the zero points with the rule secured to adjusted position as aforesaid.

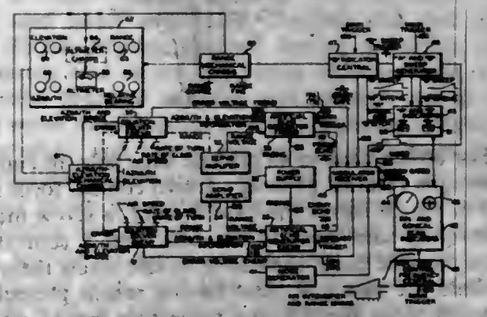
**2,774,147**
**MEANS FOR AXIALLY LOCATING A ROTATABLE SLEEVE ON A PIN**
**John Loxham, Letchworth, England, assignor to The Sigma Instrument Company Limited, Letchworth, England, a British company**
**Application May 29, 1953, Serial No. 358,489**
**6 Claims. (Cl. 33—181)**

1. In combination a pin, a sleeve rotatably mounted on the pin, a cap plate carried on an end of the pin, peripheral portions of the plate projecting radially beyond the periphery of the pin, a first face on the sleeve and adjacent said peripheral portions, a second face on the peripheral portions and adjacent said sleeve, angularly spaced pads projecting from one of said faces towards the other of said faces, reference surfaces on said pads for contacting said other face, said reference surfaces and said other face being perpendicular to the axis of rotation of the sleeve about the pin, and means for resiliently pressing together said other face and said reference surfaces.

---



**2,774,148**
**PORTABLE CLOTHES DRYER**
**William E. Werth, Kodiak, Territory of Alaska**
**Application June 3, 1954, Serial No. 434,129**
**1 Claim. (Cl. 34—133)**

In combination with a heating chamber having a door swingable into an open horizontal position in front of the chamber, of a clothes dryer removably positioned in the chamber and comprising a unitary structure including a base having a pair of uprights, a perforated clothes drum rotatably supported on the uprights, a ring gear at one end of the drum, an extension coplanar with the base and resting on the open door of the chamber, a motor supported on the extension and having a pinion in driving engagement with the ring gear, and a longitudinally extending air scoop on the outer surface of the drum, said drum having an opening intermediately adjacent the air scooping side of said air scoop and through which air is deflected to the interior of the drum by the air scoop.

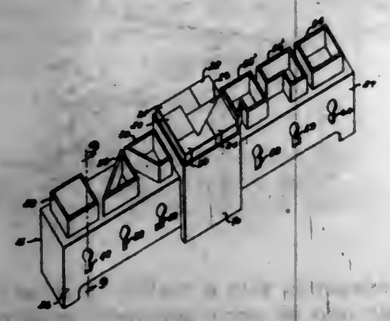
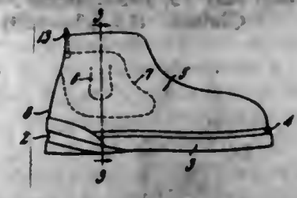
**2,774,149**
**RADAR TRAINER**
**Raymond L. Garman, Flushing, N. Y., and Marcel E. Droz and Sidney B. Cohen, Cambridge, Mass., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Navy**
**Application February 19, 1946, Serial No. 648,793**
**8 Claims. (Cl. 35—10.4)**



1. A system for training radar operators in the location of moving objects comprising an indicator unit having indicator displays, indicator adjustments, power supplies, sweep generators, trigger voltage sources, and data panels as found on a radar system; means to produce outputs giving range, azimuth, and elevation data about the position of an object in response to adjustments adapted to represent the air speed, rate of climb, and rate of turn of said object; apparatus for producing signals derived from said indicator sweep, delayed by a time proportional to said range data, and attenuated in response to said azimuth and elevation data and to indicator adjustments of azimuth and elevation; means to modulate said signal in response to voltage representing the characteristics of high frequency radar scanning, means to apply said modulated signal to said indicator, and means connected to said indicator adjustments to present on said data panels the position parameters indicated for said objects.

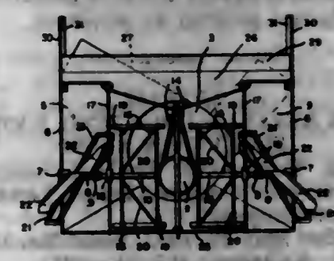
by each of said side shafts to rotate therewith and cut a bulldozer assembly comprising rearward extensions of

2,774,150
**EDUCATIONAL TOY**
Robert I. Genin, Hollis, N. Y.
Application May 19, 1955, Serial No. 509,634
9 Claims. (Cl. 35—22)



1. An educational toy comprising a housing having a plurality of openings of different shape section, block elements respectively of similar shape and adapted to fit the openings, cam elements journalled in the housing under the respective openings and adapted to support and elevate said block elements when turned, said housing having a plurality of different shape key openings, said cam elements having recesses respectively aligned with the key openings and adapted to receive the key and to be engaged thereby so that a turning of the cam elements may be effected.

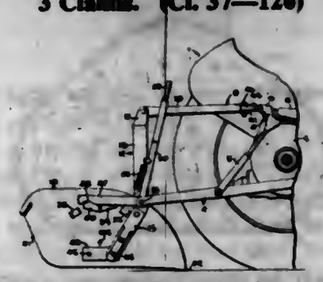
2,774,151
**CLEAT FOR ATHLETIC SHOES**
Oscar E. Dahlquist and Edwin I. Ackerson, Rockford, Ill.
Application January 20, 1955, Serial No. 483,068
1 Claim. (Cl. 36—59)



For attachment to an athletic shoe sole, in combination, a metallic cleat of generally frusto-conical form the larger end of which forms the base thereof, a screw member for connecting said cleat to the sole, and a centrally perforated metallic plate applicable to said screw member intermediate the sole and cleat having means projecting from opposite sides thereof, the projecting means on one side being to grip the sole and secure the plate against rotation relative thereto, and the projecting means on the other side being in the form of spring lugs in circumferentially spaced relation to the screw receiving hole and all inclined in one direction and at approximately the same acute angle with respect to said plate, said cleat having an axial bore threaded for threaded engagement on said screw and having circumferentially arranged with respect to said bore on the base a circular series of radial ratchet teeth arranged for deflection of the spring lugs and positive ratchet locking engagement with said lugs when the cleat is tightened on the screw against the plate, the metal of the radial ratchet teeth being die-cast metal which is softer than the metal of said spring lugs and plate, whereby the ratchet teeth on the cleat are adapted to be stripped by the cutting action of the lugs on the die-cast metal of the teeth when the cleat is forcibly turned in a loosening direction with a force appreciably greater than that to which the cleat is subjected under ordinary playing conditions.

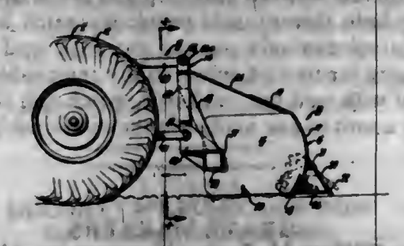
2,774,152
**ARTICLE OF FOOTWEAR**
Robert Alber, St. Anton, Austria, assignor to Alcoa-Etablissement, Vaduz, Liechtenstein, a company of Liechtenstein
Application June 1, 1955, Serial No. 512,461
Claims priority, application Austria October 2, 1954
3 Claims. (Cl. 36—71)

1. In an article of footwear having a bladder adapted to contain a fluid and having a valve for inflating said bladder by said fluid and for deflating said bladder; said bladder comprising a hollow body of plastic material, substantially flat when in deflated condition, said body including two laterally extending lobes, each lobe having an upper narrower portion and a lower wider portion, a bridge portion interconnecting said upper portions of said lobes, said valve extending from said bridge portion beyond the said upper portions of said lobe, said lower lobe portions being shaped at their peripheral boundaries and with respect to said bridge portion so that when said footwear is applied to the foot of the wearer said lower lobe portions and said upper lobe portions cover substantially the ankle bones of the wearer's foot as well as regions adjacent thereto, and said bridge portion overlies the area above the heel bone and covers the Achilles tendon of the foot of the wearer, said valve being located centrally of the rear of said article of footwear.

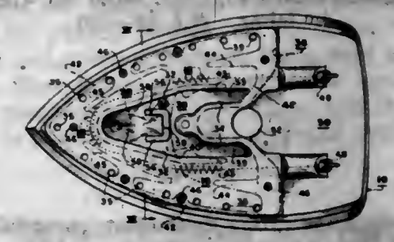


2,774,153
**SNOW PLOW**
Selden G. Washburn, Goodwin, S. Dak.
Application May 20, 1953, Serial No. 356,239
2 Claims. (Cl. 37—43)

1. In combination with a snow plow of the rotary type having a housing and a fan disposed in said housing substantially normal to the direction of travel of the plow to move snow upwardly and away from the road traversed by the plow, a rotatable shaft carried transversely of said housing and in forwardly spaced position relative to said fan, a plurality of arms extending radially from said shaft, a plurality of cutters carried by said arms, said cutters being disposed in spaced substantially parallel relation to said shaft, said arms being of such length and said shaft being so located that said cutters engage and cut snow lying forwardly of said fan and in close proximity to the ground over which they travel as they rotate with said shaft, the axis of rotation of said cutters being normal to the axis of rotation of said fan, said cutters serving to pre-cut and pulverize snow before it reaches said fan to facilitate the operation of the latter, a pair of side shafts rotatably carried in said housing in angular relation to said central shaft, means connecting one end of each of said side shafts to the adjacent end of said central shaft to rotate said side shafts from said central shaft, and a side cutter carried by each of said side shafts to rotate therewith and cut snow lying laterally of said cutters, said side cutters each comprising a substantially U-shaped blade carried by and extending substantially radially from said side shafts, and a radially extending impeller carried on said side shafts and in rearwardly spaced relation to said blades to move snow cut by said blades into said fan.



2,774,154
**EARTH MOVING ATTACHMENT FOR TRACTORS**
James Curtis McNeice, Lillington, Leamington Spa, England, assignor to Massey-Harris-Ferguson (Sales) Limited, a British company
Application November 30, 1953, Serial No. 395,217
Claims priority, application Great Britain December 1, 1952
3 Claims. (Cl. 37—126)



1. A reversible dig and carry implement for attachment behind a tractor having a pair of draft links trailingly pivoted on its rear end portion for a vertical movement by a power unit on the tractor, which comprises a scoop-supporting bail pivotally attachable between said draft links and liftable thereby, a scoop having a first pair of pivot means at opposite sides thereof between its center of gravity and its digging edge for pivotally engaging the bail ends to swingably suspend said scoop with the digging edge directed forwardly towards the tractor, an alternate pair of pivot means at opposite sides of said scoop between said rear wall and said center of gravity for pivotally engaging said bail ends to swingably suspend said scoop with the digging edge directed rearwardly away from the tractor, means to prevent swinging of the bail about its pivotal attachment when the scoop carried thereby is digging either toward or away from the tractor and means for holding said scoop in a fixed position relative to said bail having release means to permit the weight of the scoop acting through the center of gravity to swing the scoop for dumping in a direction away from the tractor when the scoop is positioned for either forward or reverse direction digging.

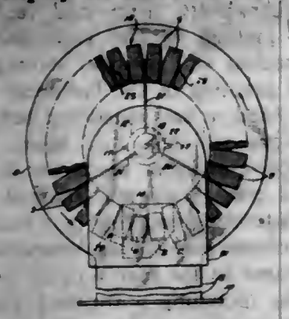
2,774,155
**COMBINED SCRAPER, BULLDOZER, AND SCARIFIER**
Ronald N. Hipp, Menlo Park, Calif., assignor to Bob Hipp Welding Works, Palo Alto, Calif., a copartnership
Application September 8, 1953, Serial No. 379,037
1 Claim. (Cl. 37—145)

A combination scraper, bulldozer and scarifier comprising a bucket having spaced, parallel side walls, an open top and front and a curved, outwardly convex rear wall; a scraper blade attached to said rear wall and extending below the lower edges of the rear and side walls; a bulldozer assembly comprising rearward extensions of said side walls and at least one intermediate stop member extending rearwardly from said rear wall, and a bulldozer blade pivoted to said extensions, said extensions and intermediate stop member serving as abutments to limit forward pivoting of the bulldozer blade; a massive cross beam fixed to and extending between said side walls at their forward ends, said beam being formed with slots to receive scarifier teeth; an A-shaped frame mounted on said cross beam and adapted to couple the device to the self-leveling coupling of a tractor; and reinforcement and connecting means connecting the upper end of said A frame to the rear wall of the bucket, said connecting means including a forward and upward extension of said rear wall.

2,774,156
**STEAM IRON BASE**
Bernard F. Parr, Mansfield, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application July 3, 1953, Serial No. 365,949
4 Claims. (Cl. 38—77)

1. A steam iron of the flash type comprising a soleplate having front and rear portions and provided with a bottom pressing surface, a steam generating chamber disposed in said soleplate and provided with a side wall, said soleplate having a passage extending from the rear portion of said steam generating chamber and communicating with said bottom pressing surface, a cover plate disposed in vapor-tight relation to said soleplate and overlying said steam generating chamber and said passage, an electric heating element having a portion disposed adjacent said steam generating chamber side wall and a portion disposed adjacent said passage, means for admitting water to said steam generating chamber through said cover plate, and a trap disposed in said steam generating chamber rearwardly of said water admitting means, said steam generating chamber having a bottom surface sloping downwardly in the direction toward said trap and serving to direct unvaporized water into the confines of said trap, said trap being in spaced relation to the side wall of said steam generating chamber and having a U-shaped wall extending upwardly from said bottom surface to said cover plate, said trap wall, together with the bottom surfaces of said steam generating chamber and of said cover plate, forming a cup having an opening facing said water admitting means, and said trap serving to obstruct flow of said water to said passage.

2,774,157
**ANIMATED DISPLAY DEVICE**
George Glacius, Freeport, N. Y., assignor to Ekson-Freeman Co., Inc., Long Island City, N. Y., a corporation of Delaware
Application June 24, 1954, Serial No. 438,956
13 Claims. (Cl. 40—68)



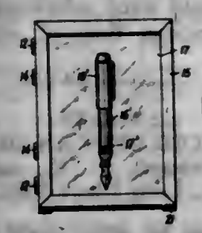
1. An animated display comprising an endless carrier, drive means for effecting movement of said carrier along a predetermined closed path, a plurality of display elements rotatably supported on said carrier for rotation thereabout and movable therewith along said path, each display element having front and rear display faces, and

a hollow metallic body portion secured on the top wall upon itself, presenting a pair of opposed loops with the

a stationary cam positioned in said path and engageable by successive display elements for effecting substantially

180° rotation thereof about said carrier, all of said display elements thus being reversed to present opposite faces upon successive cycles of carrier movement.

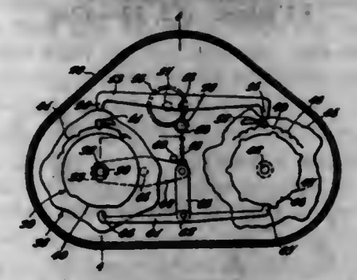
---



**2,774,158**
**INDICIA REGISTERING MECHANISM**
**William Tamcochat, Bronx, N. Y., assignor to The Zell Products Corporation, Norwalk, Conn.**
**Application March 15, 1954, Serial No. 416,029**
**4 Claims. (Cl. 40—70)**

1. An indicia indicating mechanism comprising a first and second dial mounted on the same axis, and a stationary member; each of said dials containing a plurality of indicia thereon; a cover for said dials containing means for viewing certain of the indicia on said dials; connecting means interlocking the first and second dials to cause both dials to rotate as a unit when the first dial is rotated in one direction, said connecting means including a disconnector for unlocking the two dials when the first dial is rotated in the reverse direction; holding means interlocking the second dial and the stationary member for preventing rotation of the second dial when the first dial is rotated in the reverse direction, said holding means including a releasing mechanism for unlocking the second dial from the stationary member when the first and second dials are rotating in the same direction.

---



**2,774,159**
**DISPLAY DEVICES**
**John Stewart Bell Wright, London, England, assignor to Transart Aktiebolag, Gothenburg, Sweden, a corporation of Sweden**
**Application July 18, 1952, Serial No. 299,670**
**Claims priority, application Great Britain July 21, 1951**
**4 Claims. (Cl. 40—102)**

2. A display device comprising a rigid support bearing an element of a composite representation, means mounting the support in a position slightly inclined to the vertical on a vertical surface, a plurality of transparent sheets each bearing further elements of the composite representation, each transparent sheet being carried by a peripheral rigid frame of an essentially greater thickness than that of its sheet, means to hinge one of said transparent sheets at one edge to the support and means to hinge the second transparent sheet at the same edge to the first, said hinge means being located so as to cause the support and frames to project into one another and to cause registration of the elements of the support and the transparent sheets in a superimposed position of the support and the transparent sheets.

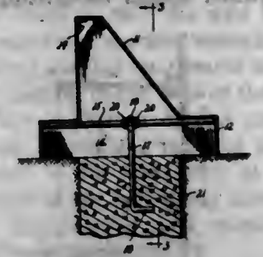
**2,774,161**
**SUSPENDING BINDER STRIP AND TAB UNIT FOR CALENDARS AND THE LIKE**
**Lyman W. Dixon, Chicago, Ill.**
**Application April 8, 1954, Serial No. 421,885**
**4 Claims. (Cl. 40—119)**

1. An article of manufacture for use in binding, comprising a binding strip, a suspending eyelet tab of readily bendable metal disposed in overlapped relation to said strip, and a protective patch of flexible, non-metallic material interposed between said strip and tab in overlapped relation to both thereof, said protective patch being dimensioned to substantially overlap the outer end of said tab while being freely and substantially removable out of association with said tab, said strip, patch and tab being secured as a unit to one anoher in the relationship described.



---

**2,774,162**
**GRAVE MARKERS**
**William M. Porter, Montgomery, Ala.**
**Application January 11, 1955, Serial No. 481,108**
**1 Claim. (Cl. 40—124.5)**

A grave marker comprising a hollow base formed from sheet metal and having an open bottom and a top wall provided with a substantially centrally disposed opening,

a hollow metallic body portion secured on the top wall of said base in register with said opening, a horizontal shaft disposed centrally in said base, the end portions of said shaft being secured to the underside of said top wall at opposite edges of said opening and the intermediate portion of the shaft extending transversely under the opening, a rod-shaped anchoring member provided at one end thereof with an eye swingably mounted sub-

stantially midway on said shaft and projecting into said hollow body portion, a laterally angulated ground anchoring element provided at the free end of said anchoring member, and a pair of collars provided on said shaft at opposite sides of said eye, said anchoring member being of such dimension relative to said opening whereby to permit swinging thereof on said shaft from a projected position through the open bottom of the base to a retracted position within said base and body portion.

---

**2,774,163**
**DISPLAY DEVICE FOR USE WITH TIRES**
**Ernest Leslie Wathen, Rocky River, Ohio**
**Application March 27, 1956, Serial No. 574,275**
**14 Claims. (Cl. 40—125)**

10. A display device for use with tires, the same consisting of a vertically elongated piece of flexible sheet material of suitable thickness and stiffness having a transverse bending line adjacent its upper end, the portion above said line forming a tab that is adapted to be extended downwardly and rearwardly, and the part below said line constituting the body portion of the device, the lower end of the body portion being adapted to be inserted into the bottom portion of an upstanding tire so that the body portion may be bowed forwardly about the front side of the top portion of the tire, and means connected to said tab and extended downwardly about the rear side of the top portion of the tire and anchored beneath said portion so as to retain the body portion in forwardly bowed condition and under stress.

---

**2,774,164**
**DECORATIVE PACKAGE BOW**
**Bill Y. James, Miami, Okla.**
**Application September 25, 1953, Serial No. 382,233**
**4 Claims. (Cl. 41—10)**

1. A substantially circular decorative bow comprising a number of identical, initially separate, flat, elongated strips, each having a central perforation and a hole at each end thereof respectively, each strip being rebent upon itself, presenting a pair of opposed loops with the holes thereof aligned with its central perforation, said loops having arcuate bights and being relatively superimposed and uniformly offset relatively in spoke-like fashion radiating from the aligned holes and perforations in all directions; a short strip having an opening adjacent each end thereof and formed into a loop with the openings thereof in alignment with the central perforations of the elongated strips thereabove; an initially flat attaching member having an aperture therethrough in

alignment with said central perforations therebeneath, said member being adapted for adhesive interconnection with the article to be adorned; and a fastening element having a head thereon in engagement with said short strip within the loop formed thereby and at least one bendable leg passing through the openings, the perforations and said aperture, said leg being bent intermediate the ends thereof into engagement with said attaching member whereby to retain the strips and the attaching member in place and properly arranged thereon.

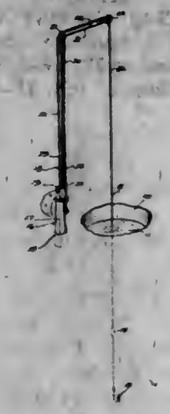
**2,774,166**
**AUTOMATIC FISHHOOK JERKING DEVICE**
**Myron Brenzo, Port Clinton, Ohio**
**Application May 9, 1956, Serial No. 583,719**
**4 Claims. (Cl. 43—15)**

1. A device for automatically jerking fish hooks comprising, in combination, a track of channel shape form in

end thereof to a tail end, said body having eyes at the therefrom, a guide plate formed integrally with the lower

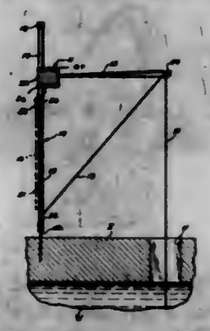


cross section, said track being adapted to have a fishing line attached thereto, a carriage slidably mounted upon said track, an arm extending laterally from said carriage, a latch fixed to said arm and extending downwardly, a nib fixed to said track and projecting forwardly from the back of said channel, there being sufficient space on each side of said nib for said latch to move upwardly or downwardly past said nib when said latch is swung to one side of said nib, a lug fixed to said track in position

to limit the movement of said carriage therealong, a resilient retractable member consisting of a strip of elastic material, means for attaching said resilient retractable member to said track adjacent its upper end and to said carriage, whereby said resilient retractable member is elastically deformed when said catch is engaged with said nib, and means for connecting a fish hook to said arm, whereby a tug upon said fish hook will release said catch from said nib and said fish hook will be jerked.

---

**2,774,167**
**ICE FISHING DEVICE**
**Earl Tyson, Oshkosh, Wis.**
**Application December 30, 1954, Serial No. 478,635**
**2 Claims. (Cl. 43—17)**



1. A fishing device having a base, a resilient wire-like standard extending substantially rectilinearly from said base, and an outstanding portion joined to and extending from said standard and terminating in a line guide, an angle guide positioned adjacent the junction of the standard and said outstanding portion, a signal member having a pulley-like member and mounted to reciprocate freely along said standard, a line secured to said base and extending successively through the angle guide, through the pulley-like member, back through the angle guide and through the terminal line guide on said outstanding portion to a fish hook, whereby a pull on the line portion extending from said terminal guide in the direction of said hook will flex the standard and the outstanding portion and will pull upwardly on the signal member to move the same and to provide for an extension of line for the run of a fish pulling on the line.

---

**2,774,168**
**ICE FISHING APPARATUS**
**Curtis Chute, Wayzata, Minn.**
**Application May 20, 1954, Serial No. 431,188**
**1 Claim. (Cl. 43—17)**

In an ice fishing apparatus, an elongated support adapted to be mounted in upright position on the ice, a housing mounted on the support, an audible signal mechanism disposed within the housing, an elongated rod pivoted to the housing for up and down movement and extending therefrom at right angles to the support for sounding the signal mechanism as said rod is moved downwardly, and switch means connecting the rod to the housing allowing continued downward movement of the rod about its pivot after the signal mechanism has been sounded, said switch means comprising a fixed contact

mounted on the housing, a bracket movable with said rod and pivotally mounted on the housing for swinging movement toward and away from the fixed contact, and a movable contact mounted on the bracket and adapted to engage the fixed contact as the bracket swings toward the fixed contact, said movable contact being of a yieldable material to maintain engagement with the fixed contact with continued movement of the bracket toward said fixed contact.

---

**2,774,169**
**WEEDLESS LIVE BAIT FISHING PLUG**
**Herman A. Matz, Perham, Minn.**
**Application December 2, 1954, Serial No. 472,630**
**4 Claims. (Cl. 43—41)**

1. A live bait holding and fishing device comprising, in combination, a buoyant plug, a fishhook spaced from the trailing end of said plug and having a rigid shank mounted axially in said plug, a rigid live bait hook having a rigid shank superimposed upon the top of said plug, secured to a central portion of said plug and in parallelism with said first named shank, said plug being longitudinally slotted and embodying complemental top and bottom portions, each of said shanks having an eye and the eyes being aligned with one another and one of said eyes confined in the slot between said top and bottom portions, and a single assembling screw screwed through said top portion and into said bottom portion and also passing through both of said eyes to in this manner assemble the cooperating parts, said slot being tapered outwardly and having a filler therein.

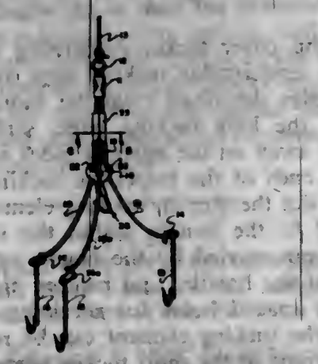
---

**2,774,170**
**FISH LURE**
**Trevor Baker, Palmer, Mass.**
**Application June 22, 1954, Serial No. 438,453**
**1 Claim. (Cl. 43—42.5)**

A fish lure comprising a comparatively thin body having a general longitudinal axis extending from a head

end thereof to a tail end, said body having eyes at the respective ends thereof; said lure having at its forward end a downwardly inclined portion on the lateral surface of the lure; the tail portion of the lure on the same side presenting an upwardly inclined surface with respect to the said longitudinal axis of the lure, when viewed from below; the back or upper edge of the lure having a single reverse S formation from head to tail, the opposite or belly edge having an approximate double S formation from head to tail; the said lateral surface having scales and markings thereon resembling those of a fish, the other lateral surface or reverse side being concave from a point slightly to the rear of the head opening to the tail; the lower portion of the concavity being delineated by a line having the tail end thereof slightly inclined with respect to the remainder of the line when in plan the head end of the lure being directed upwardly and the tail end downwardly with respect to the said axis when viewed from above.

---



**2,774,171**
**FISHING LURE**
**Lynn E. Pulver, Swea City, Iowa**
**Application April 20, 1955, Serial No. 502,600**
**6 Claims. (Cl. 43—42.19)**

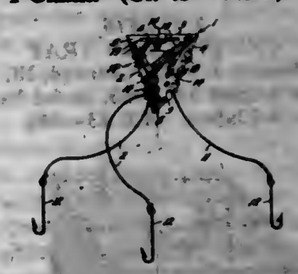
6. A fish lure adapted to be connected intermediate a fish hook member and a fishing line, said device comprising a blade provided with an integrally formed lip member which extends at approximately a 85° angle with respect thereto, said lip member having a hole therethrough, a shaft extending through the hole in said lip member, said blade being substantially elliptical in plan with the outer free end thereof of greater width than said lip member, the outer surface of said blade being transversely concave and the inner surface thereof being transversely convex, the tip of the free end of said blade extending angularly toward said shaft.

---

**2,774,172**
**FISHHOOK SPREADER**
**Charles A. Leverth, Jr., Bedford, Ohio**
**Application September 4, 1956, Serial No. 607,860**
**2 Claims. (Cl. 43—42.74)**

1. A device of the character described comprising a multiplicity of leaders connected together at one of their ends, means for attaching a fish hook to the other end of each of said leaders, and means for selectively spacing the said other ends from one another, said means comprising a cylindrical sleeve closely surrounding said leaders, a neck formed integrally with the lower end of said sleeve and extending downwardly and outwardly therefrom, a guide plate formed integrally with the lower end of said neck and extending downwardly and forwardly therefrom, said plate having an opening therethrough for the passage of each of said leaders, and guide means for said leaders in the upper end of said sleeve, said last-mentioned means comprising openings in the upper end of said sleeve each adapted to receive therethrough one of said leaders, the upper end of said sleeve having integrally formed therewith a pair of ears bent to face-to-face relationship, said openings in said sleeve being positioned immediately adjacent said ears.

---



**2,774,173**
**TAPERED LEADER FOR FISHING PURPOSES FROM SYNTHETIC POLYMERS**
**Heinz Thienemann, Beuel (Rhine), Germany**
**Application June 28, 1954, Serial No. 461,037**
**2 Claims. (Cl. 43—44.98)**

1. A tapered leader having excellent throw characteristics comprising a single thread of synthetic linear high polymers of a length between 1.8 and 3.5 meters, in which the diameter of the thread decreases at different rates to the two ends from a maximum diameter located between the ends, said ends being of different diameters, and the distance from the maximum diameter to the finer of the two ends is at least twice as great as the distance from the maximum diameter to the coarser end.

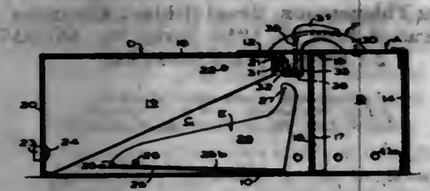
---

**2,774,174**
**SINKER**
**Harry Ganger, Atlantic City, N. J.**
**Application January 13, 1955, Serial No. 481,590**
**1 Claim. (Cl. 43—44.99)**

A sinker consisting of a hollow lead pyramidal framework, the side walls of the framework having apertures large enough to let chum protrude therefrom; a detachable cover conforming in shape to the top edge of the framework and tightly fitting within the framework; a central eye in the cover for attaching a fishing line thereto; each of the side walls of the sinker having a relatively small bar formed near its upper edge; the cover being provided with a slot adjacent each of the side edges thereof, each slot being parallel with the adjacent side edge; and a stainless steel clip fitting over each of the respective bars and fitting within each of the respective slots in the cover for tightly holding the cover to the framework, and the clips being adapted to reflect any light that may strike the said clips when the sinker is immersed.

---

**2,774,175**
**ANIMAL TRAP**
**Ellsworth L. Maddocks, Gustine, Calif.**
**Application September 10, 1954, Serial No. 455,159**
**2 Claims. (Cl. 43—61)**

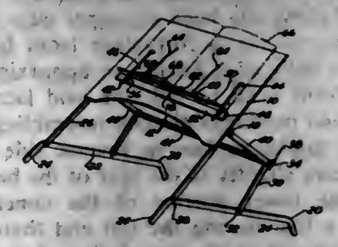


1. In an animal trap: a box having a bottom, spaced-apart opposing side walls rising therefrom; and a top wall

spring means for protracting the first manikin and con-

fixed to the side walls and extending from the rear end of the box to a point intermediate the ends of the side walls; a swingable lid including a top cover wall extending from said top wall to the front of the box, a front wall depending from said top cover wall; and opposed side walls attached to the top cover wall and the depending front wall, the side walls of the lid being positioned inwardly but adjacent to the opposing side walls of the box; a transverse pivot rod projecting through registering openings in the side walls of the box and lid for pivotally connecting the box and lid together, said rod being disposed intermediate the ends of the lid; the front of the box being open when the lid is raised, and the front wall of the lid providing a closure at the front of the box when the lid is lowered; and a swingable platform disposed in the box,

and including a bottom having spaced-apart side walls rising therefrom positioned adjacent to and inwardly of the side walls of the box; and a transverse pivot rod extending through registering openings in the side walls of the box and platform for pivotally connecting the box and platform together; the latter pivot rod being disposed at a forward section of the platform, and the back section of the platform being movable up and down; the side walls of the platform terminating at their tops with forwardly-projecting hooks, which are removably engageable over a back section of the lid for holding the lid in raised position when the trap is set; said platform being swingable to disengage the hooks from the lid by an animal advancing over the back section of the platform towards the rear of the box.



---

**2,774,176**
**CRUSTACEAN TRAP**
**Dennis J. Finn, Chicago, Ill.**
**Application August 11, 1955, Serial No. 527,814**
**4 Claims. (Cl. 43—69)**

1. A device for trapping Crustacea including a foraminous housing and an inlet mechanism disposed in a surface thereof, said inlet mechanism comprising a frame member including a downwardly extending wall defining an opening into said housing, a plurality of spaced-apart recesses in the lower portion of said wall, and weight-sensitive means for permitting ingress and preventing egress of said Crustacea through said opening, said weight-sensitive means comprising a plurality of depending members, said depending members having upper portions pivotally suspended in said recesses and being substantially complementary to the lower portion of said wall when said depending members are in closed position to prevent egress of said Crustacea through said opening, said depending members also having lower portions extending generally inwardly from said upper portions and cooperating in the normal suspended position of said depending members to obstruct said opening.

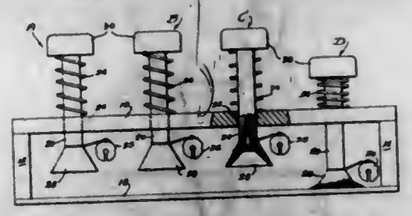
**2,774,177**
**COLLAPSIBLE ADJUSTABLE COMBINED BOOKREST**
**John Battista Murgia, Englewood, N. J.**
**Application December 30, 1953, Serial No. 401,278**
**2 Claims. (Cl. 45—60)**

1. A collapsible support comprising a thin substantially rectangular somewhat elongated member; a pair of spaced parallel base bars disposed under the end margins of the member; a front strut frictionally pivotally riveted at one end to the front end portion of each bar and at the other end to the adjacent front corner of the member; a rear strut frictionally pivotally riveted at one end to each bar slightly to the rear of the mid part thereof; a clamping pivot bolt passed through the other end of each rear strut and having a head at one end and threads with thumb nut thereon at the other end; a link pivoted at one end on said bolt and at the other end to said member a short distance to the rear of the pivot point on the member of the front strut; whereby said book rest is movable to approximately vertical and horizontal and intermediate positions relative to said base bars; a tube on said bolt engaging with rear struts; and legs frictionally pivotally riveted on the lower face of the member and normally disposable under the rear edge of the member and provided with notches in the free end adapted to receive the bar when the member is horizontal and said legs are substantially vertical.

---

**2,774,178**
**SLIP COVER TUCKER**
**Alfred N. Nelson, Flushing, N. Y.**
**Application May 6, 1954, Serial No. 427,956**
**3 Claims. (Cl. 45—138)**

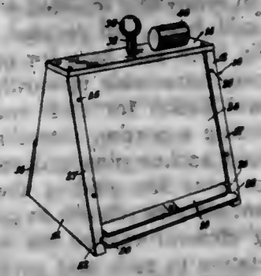
1. A slip cover tucker comprising a tucking element having a semicircular tucking edge and a short corner tucking edge described from the same radius that may prescribe the long tucking edge, said tucking element being cut away on the opposite sides and between corresponding ends of the respective tucking edges, a handle having a slot therein, the tucking element being pivotally connected to the handle within the slot, and a spring retaining pin carried by the handle and extendible into the slot of the handle, said tucking element having diametrically spaced holes for receiving the retaining pin whereby the tucking element can be retained to present either the long or the short tucking element edge.



---

**2,774,179**
**POUNDING TOY**
**Albert M. Zalkind, Arlington, Va.**
**Application November 25, 1953, Serial No. 394,285**
**5 Claims. (Cl. 46—1)**

1. A child's pounding device comprising a plurality of reciprocable vertically disposed rod means, spaced within



arm's reach, plate means having bores through which individual rod means are slidably movable, a resilient element surrounding each rod means and having an end engageable therewith to maintain respective rod means in initial raised position, a suction cup affixed on the lower end of each rod means, a second plate means

comprising a smooth upper surface below said first plate means engageable by the mouths of said suction cups for pneumatic adhesion thereof upon depression of said rod means, each resilient element having an upward biasing force sufficient to overcome its respective suction cup adhesion after a predetermined interval.

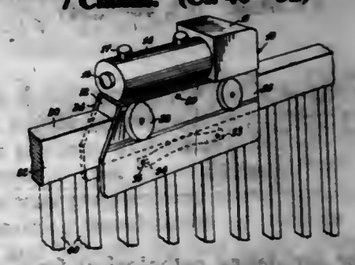
---

**2,774,180**
**TOY SUPPORT FOR PLAY BLOCKS**
**Frances L. Ilg, New Haven, Conn.**
**Application June 10, 1953, Serial No. 360,690**
**8 Claims. (Cl. 46—1)**

4. An educational toy comprising, in combination, a case, said case including a base adapted to lie in a horizontal plane and means defining a sloping supporting surface for receiving a plurality of blocks in substantially co-planar alignment, said supporting surface sloping inwardly from said base toward the central vertical axis of said case and having a horizontal dimension substantially as great as its vertical dimension, means extending from said case for supporting the lowermost of said plurality of blocks from below as they lie against said sloping supporting surface in co-planar alignment in a plane sloping from said last-named means toward said axis, means for displacing at least the lowermost of said blocks away from said supporting surface, said displacing means being normally urged by biasing means away from displacement movement toward said blocks, and manually-controlled actuating means acting against said biasing means for effecting block-displacing movement of said means for displacing the blocks.

---

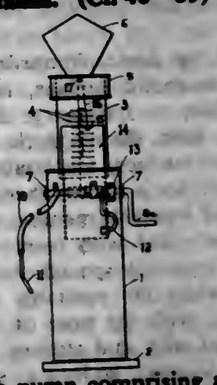
**2,774,181**
**TOY RAILWAY SIGNAL TOWERS**
**Lawrence Cowen, New York, N. Y., assignor to The Lionel Corporation, New York, N. Y., a corporation of New York**
**Application February 3, 1954, Serial No. 407,942**
**9 Claims. (Cl. 46—12)**



1. A toy railway signal tower having a toy tower body simulating a two-story building and provided with an upwardly and rearwardly extending, external stairway and with a front doorway at the second story level, two manikins, means for supporting one manikin from the tower body for oscillatory movement back and forth through the doorway, means for supporting the other manikin for sliding movement up and down the stairway, spring means for protracting the first manikin and concurrently holding the second manikin at the top of the

stairway, and electromagnetic means for retracting the first manikin and releasing the second manikin so that it may slide down along the stairway.

---



**2,774,182**
**MOVABLE TOY ON RAIL**
**Samuel L. Beder, New York, N. Y.**
**Application June 10, 1953, Serial No. 360,729**
**7 Claims. (Cl. 46—32)**

1. A toy for use in combination with the rail of a play pen, crib and the like comprising, in combination, a body portion having a lower surface for engagement with the top surface of the rail for free sliding movement thereover, depending laterally spaced-apart legs extending from said lower surface a distance substantially greater than the width of said lower surface between said legs, said legs being positioned to overlie the sides of the rail when said lower surface is in engagement with the rail and having portions extending downwardly therefrom, said legs defining with said body portion an elongated channel for reception of said rail, said channel being of substantially rectangular cross-section with a top defined by said lower surface of the body portion, sides defined by said downwardly-extending portions, and being open at the bottom, and retaining means positioned in one of said downwardly-extending portions for engagement with the under surface of said rail, said retaining means being manually displaceable out of engagement with said rail lower surface and while engaging said under surface permitting free sliding movement of said toy over said rail.

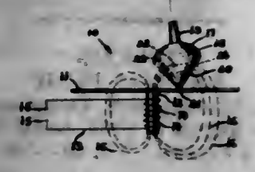
---

**2,774,183**
**TOY GAS PUMP**
**Joseph B. Montgomery, Douglasville, Pa.**
**Application August 4, 1954, Serial No. 447,787**
**4 Claims. (Cl. 46—39)**

3. A toy gasoline pump comprising a vertical, tubular base of opaque material having concentrically mounted

thereon a transparent tubular portion of reduced diameter which is devoid of liquid therein, an opaque cap mounted on said last mentioned tubular portion, an opaque cylindrical element having a closed top end and telescopically fitted in said transparent tubular portion with its open ended bottom portion projecting into said tubular base, a crank rotatably mounted on and extending outwardly of the top portion of said base, drive means between said crank and said opaque cylindrical element to effect lifting and lowering thereof as said crank is turned in one direction or in an opposite direction, so as to simulate lifting and lowering of gasoline in said transparent tubular portion.

---



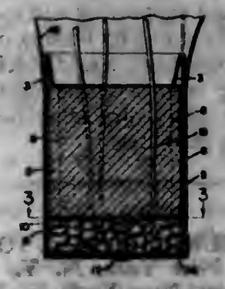
2,774,184
**DOLL FOR SIMULATION OF PATHOLOGICAL FEVER**
Albert Hefferan, Eastmanville, and George Lester Jones, Marne, Mich.; said Hefferan assignor of fifty percent of his right to G. Lester Jones
Application July 10, 1953, Serial No. 367,166
3 Claims. (Cl. 46—234)

1. A doll for simulating pathological fever conditions comprising a scale replica of a human form including torso, head, arm and leg components, an electric heating element contained therein, said heating element having means for connection to a source of electric current, a mouth for said doll constituted as a pouch opening on the exterior of the head component, said pouch being adapted to receive a clinical thermometer, a portion of said heating element being disposed in surrounding relation to said pouch to heat the same in simulation of a pathological fever condition for effecting a reading on the thermometer inserted in said pouch, and filler material surrounding said element and contiguous to said pouch for transmitting the heat of said element to the zone defined by said pouch.

---

2,774,185
**MAGNETIC TOP DEVICE**
Alois J. Koech, Columbus, Nebr.
Application March 22, 1955, Serial No. 495,897
9 Claims. (Cl. 46—235)

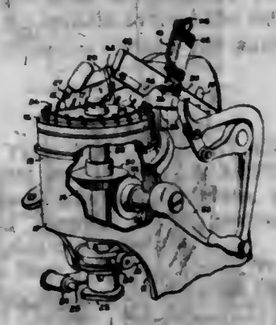
1. A magnetic top device comprising a member having an upper, non-magnetic surface, means for producing about said surface a stationary, alternating, toroidal-shaped, magnetic field, the magnetic axis of which is perpendicular to said surface, a rotatable member having a base which terminates in a nose through which the longitudinal axis of said rotatable member passes, said rotatable member being provided with permanent magnet means having its poles arcuately spaced about said longitudinal axis such that when the rotatable member is given a rotatable impetus, with the nose of said rotatable member in engagement with said surface, the rotatable member will continue to rotate so long as said means continues to produce said alternating magnetic field.



2,774,186
**FLORAL BASKET AND ANCHORING MEANS FOR FUNERAL USE**
George L. Wilkins, Cape Charles, Va.
Application June 8, 1954, Serial No. 435,220
2 Claims. (Cl. 47—41)

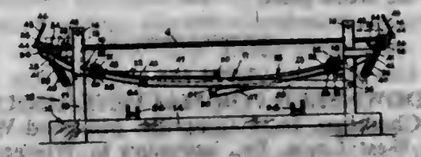
1. A floral basket comprising a body adapted to hold flowers, an enlarged base on a lower portion of said body having a flat lower surface for supporting said body and a handle secured to said body; retractible anchor means carried in converging angular relation on opposite side portions of said body and in close disposition thereto, the base including a downwardly opening lower recess portion in communication with aperture portions extending through said base, said retractible anchor means including elongated anchor pins reciprocably received within said aperture portions, said pins including a lower enlarged pointed end receivably retained within the lower recess portion of said base, said pionted end being extensible downwardly from said base for penetration into the ground and being retractable upwardly, a guide element carried on said basket for each anchor pin, said guide element including a portion extending around the circumference of said anchor pins and reciprocably receiving said anchor pins for guiding the reciprocable movement of said anchor pins relative to said basket, and a resilient securing element carried on said basket in vertically spaced relation to each said guide element for receiving an upper portion of said anchor pin for retaining the same in retracted position with the enlarged lower pointed end thereof located wholly within said recess, said resilient securing element including an arcuate portion terminating in an outwardly curving lip for facilitating the removable retention of said anchor pin.

---



2,774,187
**PACKAGE FOR TRANSPORTING CUT FLOWERS**
Vernon L. Smithers, Akron, Ohio
Application May 18, 1954, Serial No. 430,590
5 Claims. (Cl. 47—41)

1. A package for the preservation and transportation of cut flowers comprising a water-retentive container open at the top, a block of a cellular water-absorbent synthetic resin material in the container adapted to receive the stems of cut flowers, and means to hold the block substantially below the top of the container, said block having a coating of a wetting agent thereon, and a transparent waterproof and airproof wrapping surrounding the container and the flowers, the stems of which are inserted in the block.

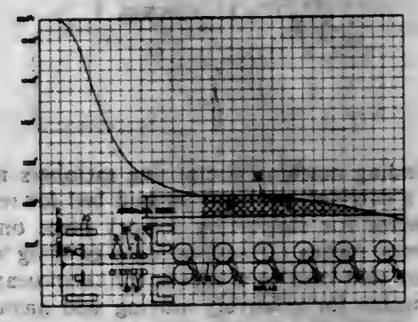


2,774,188
**CHIPPING ATTACHMENT FOR LENS CUTTING MACHINE**
Charles M. Jordan, Jr., Clinton, N. C.
Application July 29, 1955, Serial No. 525,237
5 Claims. (Cl. 49—48)

1. In a lens cutting machine of the type including a rotary clamping table, means for scoring a lens and means for rotating the table, a lens chipping attachment comprising: a plurality of cam pins projecting from said table, a hammer, means pivoting said hammer to said cutting machine, means resiliently biasing said hammer toward the lens, and means on said hammer engaging said cam pins whereby upon rotation of said cutting table and said cams, said hammer is caused to move outwardly away from said lens and then released to move toward said lens sharply thereby tapping the lens to remove the unwanted glass.

---

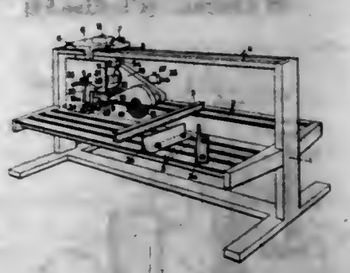
2,774,189
**APPARATUS FOR BENDING GLASS SHEETS OR PLATES**
Joseph E. Jendrisak, Rossford, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Application March 12, 1952, Serial No. 276,090
11 Claims. (Cl. 49—67)



10. In apparatus for bending glass sheets, a mold including a plurality of sections, hinge means connecting said sections together in end to end relation, and synchronizing means connecting at least two of said sections together at spaced apart points for causing said sections to move from an open to a closed position in timed relation to one another.

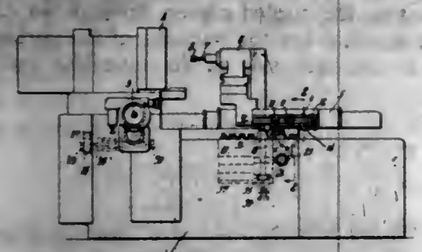
---

2,774,190
**ANNEALING GLASS**
Florian V. Atkeson, Springdale, Pa., assignor to Pittsburgh Plate Glass Company, a corporation of Pennsylvania
Application May 18, 1953, Serial No. 355,815
6 Claims. (Cl. 49—89)



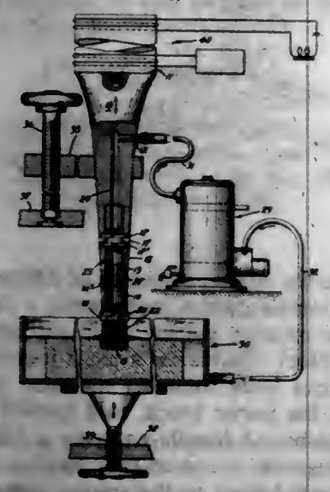
1. A process which comprises forming a continuous ribbon of glass from a molten glass bath, ...ving the glass ribbon through a cooling zone before the glass has cooled to the annealing temperature range, passing fluid coolant through the cooling zone on each side of the moving glass ribbon in indirect heat exchange relationship with the glass ribbon, applying heat separately to portions of the cooling zone opposite portions of the glass surface across the ribbon and on each side thereof within the cooling zone, maintaining said application of heat to each of said portions, separately adjusting the amount of said heat application to each of said portions, whereby the portions of the surface of the glass ribbon on each side are cooled rapidly to reach an annealing temperature substantially at the upper limit of the annealing range at substantially the same time and to create a temperature gradient between the center of the glass and the surfaces that is substantially uniform in the portions of the glass ribbon, passing the cooled ribbon through an equalizing zone while maintaining the portions of the surface of the glass ribbon on each side at an annealing temperature

substantially at the upper limit of the annealing range for a sufficient length of time to reduce substantially said temperature gradient, and passing the ribbon through an annealing zone to cool the surfaces on both sides of the glass ribbon at a progressively increasing rate of cooling while maintaining equalization of surface temperatures thereacross and between the two sides, whereby the glass surfaces are simultaneously cooled to the lower limit of the annealing range and the temperature gradient between the center and the surfaces is increased in the portions thereacross by a uniform amount.



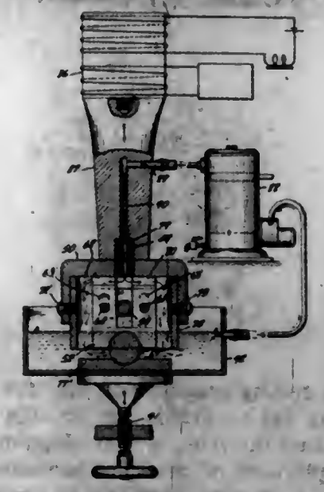
---

2,774,191
**CUTTING MACHINE**
Jean Henri Marie Joseph Bouchez, Arras, France
Application August 5, 1955, Serial No. 526,583
Claims priority, application France August 10, 1954
2 Claims. (Cl. 51—34)



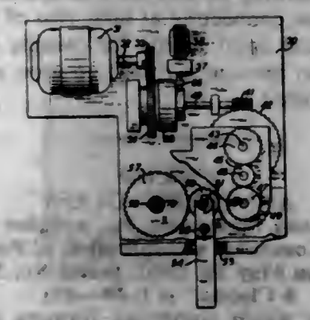
1. A machine for cutting materials of different hardness comprising in combination a framework, a carriage slidable thereon, a rotating cutting tool and driving motor mounted on a block tiltable on a shaft journaled in said carriage, a control lever rotatably mounted on the shaft which supports the motor block, said control lever comprising a spring biased handle carrying a latch member which cooperates with a curved rack fixed to a flange on the carriage, a pawl fixed to the control lever and cooperating with an abutment on the shaft supporting the motor block for regulating the depth of the cut made by said tool, a crossbar fixed to said shaft, a weight slidably mounted on said crossbar, and means for retaining the weight in place at any desired position for adjusting the downward pressure on said tool to the kind of material being cut, said means for tiltably supporting said cutting tool permitting it to be tilted upwardly at any place in its cutting movement to relieve excessive pressure against the material being cut, to avoid abnormal resistance, or to follow the shape of the material.

2,774,192
## MACHINE TOOL CYCLE CONTROL
Paul A. Grobey, Springfield, Vt., assignor to Bryant Chucking Grinder Company, Springfield, Vt., a corporation of Vermont
Application June 28, 1954, Serial No. 439,721
11 Claims. (Cl. 51—59)



1. A grinding machine comprising members including a bed and a carriage mounted on said bed for rectilinear motion, means for supporting a work piece on one of said members, means for supporting a grinding wheel on the other of said members, means for reciprocating said carriage, means for relatively moving said members for relative feed of said wheel and work piece transverse to the direction of reciprocation, means for controlling the relative motions of said members in a predetermined cycle, said means including a rotary shaft, means controlled by certain of the relative motions of said members for turning said shaaft by definite angular distances, and means controlled by the angular positions of said shaft for controlling the relative motions of said members in predetermined sequence, including a grinding step, means effective during such grinding step to actuate said feed relative moving means, and said machine including means actuated by a predetermined limit of feed to terminate said grinding step.

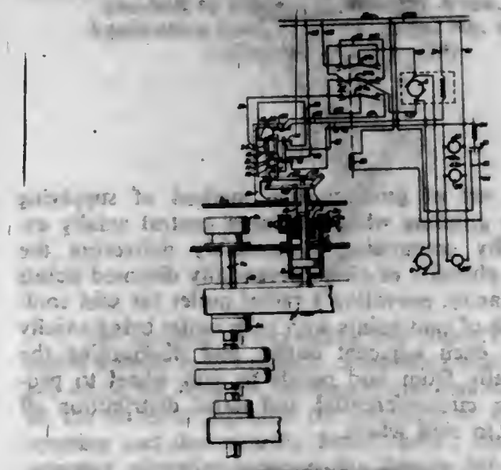
2,774,193
## TOOLS FOR ULTRASONIC CUTTING
Charles J. Thatcher, New York, N. Y., and Benson Carlin, Fairlawn, N. J.; said Carlin assignor to said Thatcher
Application October 10, 1955, Serial No. 539,405
15 Claims. (Cl. 51—59)



1. A hollow tool for cutting or drilling of hard materials by vibratory ultrasonic, impact abrasion, having a blunt tool end and channels on the exterior and interior surfaces of said tool from the upper to the lower ends thereof for flow of liquid abrasive slurries to, under and from the working, lower end face of the tool, means to vibrate said tool, axially, at high frequency and low amplitude and to force said liquid through said channels, said channels having inlet and outlet ports to said working face which are inclined with respect to the axis of vibratory movement of said tool.

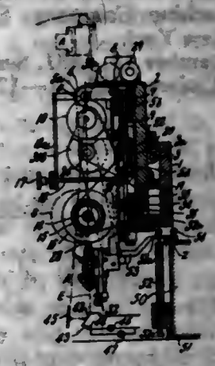
2,774,194
## ULTRASONIC TOOLS
Charles J. Thatcher, New York, N. Y.
Application November 8, 1954, Serial No. 467,443
8 Claims. (Cl. 51—59)

1. A tool for mass-production of slices of semi-conductors for the manufacture of transistors, adapted simultaneously to cut uniformly dimensioned, multiple slices from ingots to brittle, semi-conductor work-pieces by impact of a supersonically vibrated tool end upon abrasive particles of a slurry film circulated between the tool end and work face, which comprises: a tool hub and body and clamping means for the tool cutting element, and tool di-patterns formed of sheet metal rigidly supported by said hub and body and by die-pattern clamping means against displacement during said supersonic vibratory movement of the tool end, and means for altering the pattern and replaceably clamping said sheet metal die patterns to said tool body, and means forceably to circulate a liquid abrasive slurry through the interior of said tool and back of and around said die patterns and between them and the confronting surfaces of the work-piece.

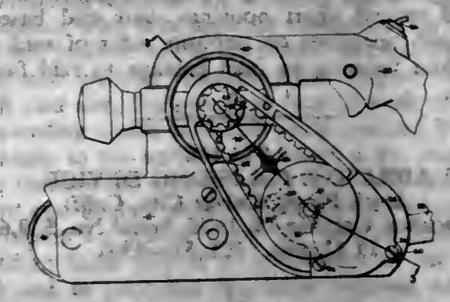


2,774,195
## DOWNFEED FOR MACHINE TOOLS
John L. Chapman, Jr., Catonsville, Md., and William R. Yeich, West Lawn, Pa., assignors to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application August 18, 1954, Serial No. 450,764
3 Claims. (Cl. 51—92)

1. A downfeed mechanism, in combination with a threaded spindle having a hand wheel fixed thereto for manual actuation to rapidly feed a driven cutting wheel downwardly toward a path in which work on a support is given successive reciprocable movements between given limits during each half cycle of a rotatable element for driving the support, the mechanism comprising driving means energized while the cutting wheel is driven, a gear mounted on the threaded spindle, a train of gears including a one revolution clutch interposed between the gear on the spindle and the driving means and operatively connected thereto, and means rotatable with the driving element to cause actuation of the clutch during each half cycle of the driving element when the work support is adjacent each limit to operatively connect the driving means through the train of gears to the gear on the spindle to rotate the spindle to feed the cutting wheel predetermined like distances toward the path.



2,774,196
## CONTROL OF THE TOOLS OF GLASS GRINDING AND/OR POLISHING MACHINES
Edmond Lavordiane, Auvelais, Belgium, assignor to Les Glaceries de la Sambre, Societe Anonyme, Auvelais, Belgium, a Belgian company
Application May 19, 1954, Serial No. 430,914
Claims priority, application Belgium May 27, 1953
7 Claims. (Cl. 51—112)

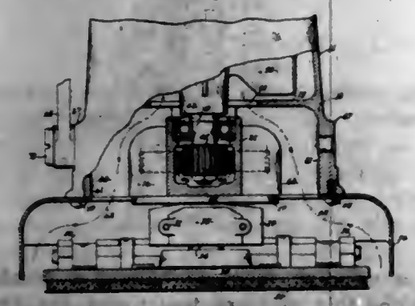


1. In a machine for simultaneously grinding or polishing both faces of a glass sheet; the combination of a support fixed in relation to its distance from the glass sheet, at least one tool holder, means mounting said tool holder on said support for movement relative to the latter in first and second directions respectively toward and away from the glass sheet, safety stop means carried by said support and movable relative to the latter in said first and second directions, an abutment connected to said tool holder to move with the latter and engageable with said stop means so that the latter adjustably limits the movement of said tool holder in said first direction relative to said support, motor means operatively connected to said safety stop means and capable of forward and reverse operation to move said stop means in said first and second directions, respectively, relative to said support, control means for said motor means operating in response to the relative movement and positioning of said abutment with respect to said safety stop means and including means normally operative in response to the slow movement of said abutment in said first direction toward said stop means to cause forward operation of said motor thereby to move said stop means in said first direction away from said abutment, means halting the forward operation of said motor means in response to the attainment of a predetermined clearance between said stop means and abutment and means operative in response to the rapid movement of said abutment in said first direction toward said stop means to interrupt the forward operation of said motor means and to cause reverse operation of the latter thereby to move said safety stop means in said second direction against said abutment for also moving said tool holder in said second direction relative to said support, and means halting the reverse operation of said motor means in response to the movement of said abutment and tool holder in said second direction to predetermined positions relative to said support.

2,774,197
## MEANS FOR FEEDING A GRINDING WHEEL OF A PERIPHERAL GRINDING ATTACHMENT INTO A WORKPIECE
Otto Bretscher, Geriafingen, Switzerland, assignor to Gesellschaft der Ludw. von Roll'schen Eisenwerke AG., Geriafingen, Switzerland, a Swiss company
Application August 9, 1954, Serial No. 448,653
Claims priority, application Switzerland August 11, 1953
7 Claims. (Cl. 51—165)

1. In a grinding machine having a grinding wheel, means supporting said grinding wheel and arranged for pendular swinging movement about a first axis to move said grinding wheel toward and away from a workpiece, respectively, and dresser means for trueing said grinding wheel; a first arm swingably attached at one end thereof to said supporting means for movement about a second axis, and rest means attached to the other end of said arm and carrying said dresser means, said first and second axes being disposed in said supporting means and in a common plane with the axis of rotation of said grinding wheel.

2,774,198
## PORTABLE BELT SANDING MACHINE
Arthur N. Emmons, Nedrow, N. Y., assignor to The Porter-Cable Machine Company, Syracuse, N. Y., a corporation of New York
Application April 5, 1955, Serial No. 499,381
3 Claims. (Cl. 51—170)



1. A power operated, bodily manipulable belt sanding machine comprising a frame having a top wall, a vertically disposed side wall depending from a side edge of the top wall, a motor housing on the top wall, a motor mounted in the housing and having its power shaft extending transversely of said top wall and having an end portion projecting outwardly from the plane of the side wall, a belt pulley fixed to said end portion of the motor shaft, said side wall being formed with a recess in its outer surface in proximity to the rear end of the frame to provide a gear compartment, an idler roll journalled at the forward end of the frame, a shaft journalled in the rear end portion of said side wall and extending transversely below said top wall, a driving roll fixed to the inner end of said shaft, the outer end of said shaft extending into said recess, a closure for said recess forming in conjunction therewith a grease tight gear compartment, a jack shaft journalled in said gear compartment and having an end portion extending outwardly through said

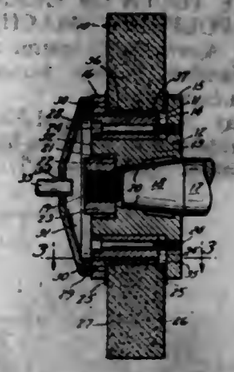
closure, gearing arranged in said gear compartment and operatively connecting said jack shaft to said driving roll shaft, a pulley fixed to the extending portion of said jack shaft, the periphery of said pulleys being formed with cogs, and a cog belt trained over said pulleys.

---

2,774,199
ABRADING MACHINE
Arthur N. Emmons, Nedrow, N. Y., assignor to The Porter-Cable Machine Company, Syracuse, N. Y., a corporation of New York
Application September 15, 1951, Serial No. 246,785
3 Claims. (Cl. 51—177)

1. A portable power operated abrading machine comprising a base of substantially rectangular shape provided on its upper surface with a centrally arranged fan compartment and with a gear compartment in its lower portion, said gear compartment consisting of a pair of spaced apart housings and a central housing positioned intermediate said spaced apart housings and communicating therewith, a crank shaft journalled in each of said spaced apart housings and said shafts having crank portions depending from the gear compartment, an abrasive pad operatively connected to said crank portions for movement thereby, a motor mounted above the fan compartment and having its shaft extending through the fan compartment into the central housing of the gear compartment, a suction fan mounted on the motor shaft in the fan compartment, gearing arranged in said housings and operatively connecting said motor shaft to said crank shafts, said central housing being smaller in dimension than said spaced apart housings, and said base being formed with apertures on opposite sides of said central housing and forming an inlet passage to said fan compartment.

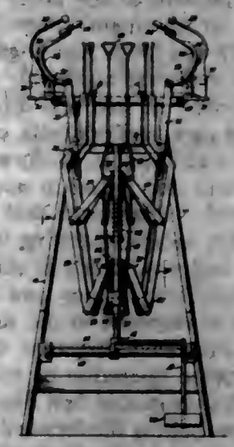
---



2,774,200
ABRASIVE POLISHING DEVICE
Alock Block, Culver City, Calif.
Application October 10, 1955, Serial No. 539,623
11 Claims. (Cl. 51—194)

1. An abrasive band comprising a central circular core member formed of a substantially rigid piece of cardboard tubing, a plurality of small rectangular abrasive strips adhered to the outer surface of said core member around the entire circumference thereof, said strips extending axially with respect to said core member, each of said strips having abrasive material on the exposed side thereof, said strips being disposed in substantially overlapping relationship to each other, the opposite ends of each of said strips extending a substantial distance into and being adhered to the interior of said core member, there being a sufficient number of said strips so that each strip has an exposed edge adapted to wear away in use to expose the portion of the adjacent strip disposed therebeneath.

---



2,774,201
LIQUID COOLED GRINDING WHEEL
John A. Harrington, Minneapolis, Minn., assignor to Continental Machines, Incorporated, Savage, Minn., a corporation of Minnesota
Application November 4, 1954, Serial No. 466,717
9 Claims. (Cl. 51—267)

6. In the art of grinding, the method of supplying coolant to a grinding wheel having a central axially extending cavity comprising controllably delivering the coolant to a plurality of circumferentially disposed points within said cavity, providing a radial outlet for said coolant from each of said points with each outlet being axially spaced from each adjacent outlet, and discharging the coolant radially from said points to said wheel to provide uniform circumferential and axial distribution of said coolant to said wheel.

---

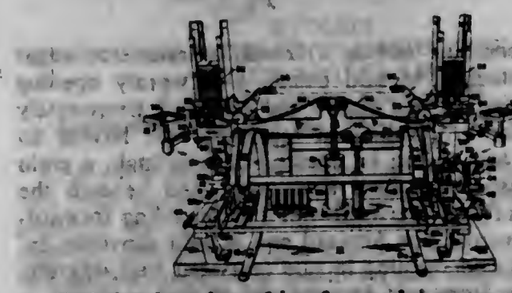
2,774,202
PAPER SOCKER
William V. Henry, Candler, N. C., assignor to American Enka Corporation, Enka, N. C., a corporation of Delaware
Application May 22, 1953, Serial No. 356,614
6 Claims. (Cl. 53—13)

1. Apparatus for manipulating a hollow yarn package during application of a paper sleeve thereto which comprises supporting means movable to and from a position in suporting relationship to one annular end wall of the package, clamping means movable to and from a position engaging the side wall of said package to hold the sleeve against axial movement, means movable to and from a position to spread the sleeve over said annular end wall, said spreading means comprising a plurality of levers, means responsive to predetermined upward movement of said levers to spread the same radially and to move said supporting means from supporting position

and means responsive to movement of said supporting means away from supporting position to move said clamping means away from clamping position.

5. The method of covering a hollow yarn package with a tubular covering of limited flexibility and long enough to cover all surfaces of the package that comprises initially surrounding the outer surface of the package while in a vertical position with one end of the tubular covering, drawing the remainder of the tubular covering across the upper end and down through the interior of said package, thereafter spreading the tubular covering over the lower end of said package and dropping the package while spreading the remaining covering over the outer surface of the package.

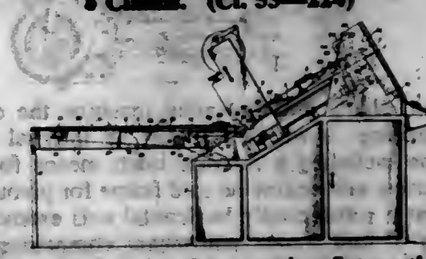
---



2,774,203
METHOD OF FILLING TUBULAR COIN WRAPPERS
Henry Augustus Smathers, Charleston, S. C., assignor of one-half to Vincent G. Jarman, Avon, N. J.
Application June 21, 1954, Serial No. 437,931
4 Claims. (Cl. 53—29)

1. The method of expanding and filling flattened open ended tubular coin wrappers comprising holding the wrapper while flat between the fingers and positioning one end of the wrapper adjacent the entrance of a downwardly opening and downwardly flared recess, compressing the wrapper edgewise between the fingers for partially expanding it so that the end thereof may be inserted into said recess, inserting said end of the partly expanded wrapper upwardly within the flared recess and toward the reduced end of the recess to gradually impart to the wrapper a substantially truly cylindrical shape, introducing a finger into the lower end of the expanded wrapper to form a support for a stack of coins of known height to be introduced into the wrapper so that the stack of coins when introduced will be positioned approximately centrally with respect to the length of the wrapper, and then introducing the stack of coins downwardly through the top of the wrapper so that the stack is supported within the wrapper by the finger.

---



2,774,204
PATCH END MACHINE
Paul F. Bowman, Ridgewood, N. J., assignor to Continental Paper Company, Ridgefield Park, N. J., a corporation of New Jersey
Application January 31, 1955, Serial No. 485,013
5 Claims. (Cl. 53—137)

1. A patch end machine for applying a sealing patch to the open end of a tubular carton having end flaps adapted to receive the sealing patch, the patch being provided with a thermoplastic adhesive on the surface thereof which is brought into contact with the carton end flaps, the machine comprising a rotatable turret adapted to receive and carry the tubular carton successively from a receiving station through an end-sealing station to a discharge station, the turret being provided with carton-carrying means for holding the carton in axial parallelism with the axis of rotation of the turret, flap folding guides positioned so as to fold the carton end flaps inwardly into patch-receiving position normal to the walls of the tubular carton as the carton is placed in receiving position in the turret and is carried from the receiving station to the sealing station, a movable patch-holding arm pivotally mounted for movement in a substantially vertically disposed arc from a horizontal position to a vertical position adjacent the end flaps of the carton, the holding arm being provided with suction means adapted to hold a patch to the lower surface of the arm when the arm is held in horizontal position, a patch feeder for feeding a single patch to the lower surface of the patch-holding arm when the arm is in its horizontal position, a heating element mounted so as to swing into a patch-heating position directly below a patch held by the holding arm, and holding arm operating means for moving the arm holding a heated patch downwardly into vertical position in contact with the inwardly folded end flaps and thus effecting sealing engagement of the heated adhesive-bearing surface of the patch with the carton end flaps.

---

2,774,205
WRAPPING AND FOLDING MACHINES
Leslie Gordon Forster, Ealing, London, England, assignor to Forsters Machine Company Limited, Hayes, England, a corporation of Great Britain
Application January 2, 1953, Serial No. 329,295
8 Claims. (Cl. 53—224)

1. Wrapping machine for covering flat or thin articles in succession with thin material comprising in combination, a bed inclined to the horizontal and having a longitudinal slot passing therethrough; fingers, extending through said slot, the operative face of each of said fingers extending above said bed being inclined backwards at an angle to the vertical to engage a flat face of said article; mechanism located below said bed and adapted to move said fingers lengthwise of the bed whereby each finger moves an article along the bed in opposition to a retarding force due to a component of the force of gravity and to frictional resistance between an edge of the article and the bed; means for feeding a strip of covering material towards said bed; means for cutting off a length of said material in front of said article; and means for carrying out tucking and folding operations thereafter.

---

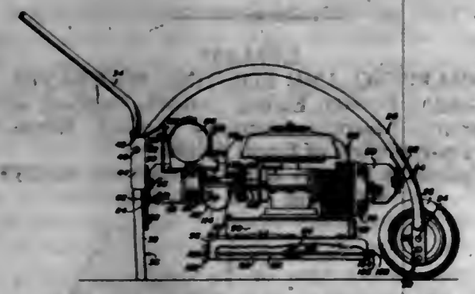
2,774,206
TANDEM DISC HARROW ARRANGEMENTS
Patrick Henry Lynch, Jr., Dunn, N. C.
Application March 11, 1953, Serial No. 341,672
7 Claims. (Cl. 55—30)

1. A tandem disc harrow arrangement for use with a tractor, said arrangement comprising a tongue, said tongue having means on its forward portion whereby it may be secured appropriately to the tractor to extend rearwardly therefrom, a forward cross support member, the last said member being secured to the tongue transversely thereto, said member serving to support at least one gang of disc harrows transversely to the tongue, a jaw bar, said jaw

bar being disposed to extend rearwardly in longitudinal alignment with and underlying a portion of the tongue, and said jaw bar being pivotally secured by its forward end to the said tongue to open away from said tongue upon being pivoted and to close against said tongue when

said jaw bar is moved upwardly, framing secured to said jaw bar toward the free end thereof, disc harrows mounted below said framing and means mounted on the free end of said tongue restraining the free end of said jaw bar from lateral movement with respect to the tongue.

---



2,774,207

## POWER MOWER WITH PIVOTAL CONNECTION BETWEEN CARBURETOR AND MOTOR

John G. Sedgwick, Houston, Tex.

Application July 2, 1953, Serial No. 365,637

4 Claims. (Cl. 56—25.4)

1. In an edging and trimming machine the combination comprising: a wheeled frame; an internal combustion engine including a mixture inlet; means for adjustably mounting said engine on said frame for pivotal movement about a substantially horizontal axis extending longitudinally of said frame, said means comprising locking means for retaining said engine in an adjusted position; a cutting blade drivingly connected to said engine for pivotal movement therewith and rotation thereby; a carburetor for said engine fixed to said frame and including a mixture outlet; and a swivel connection between the mixture outlet of said carburetor and the mixture inlet of said engine.

---

2,774,208

## COTTON PICKER

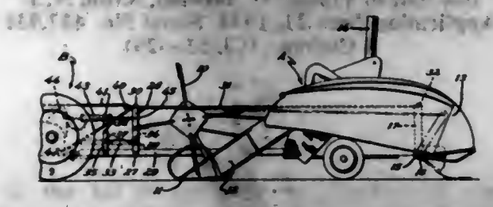
Frank R. Putnam, Odessa, Tex.

Application June 8, 1953, Serial No. 360,144

4 Claims. (Cl. 56—48)

1. In a cotton picker, the combination of at least one pair of picking cylinders mounted on vertical axes and having their peripheries spaced from each other, a vertical shaft parallel with and spaced from the axis of each said cylinder, spiders mounted on each said shaft and spaced one above the other, vertical fan blades connected between the arms of said spiders, brushes carried by said blades and having their bristles extending outwardly beyond the outer vertical edges of said fan blades, a substantially cylindrical housing around each said vertical shaft outwardly of the ends of the bristles of said brushes, and a discharge duct in each said housing.

---



2,774,209

## STRAW BUNCHING ATTACHMENT FOR COMBINES

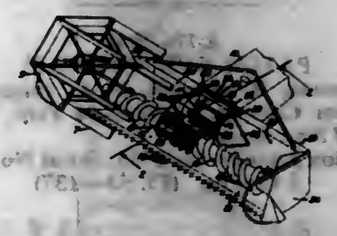
Fred R. Bauer, Durand, Wis., assignor of forty-nine percent to Norbert Benedict Bauer and Anna Mae Bauer, Durand, Wis.

Application June 30, 1951, Serial No. 234,529

8 Claims. (Cl. 56—122)

1. A waste collector attachment for a combine having a draw bar, a chaff and straw outlet, and a transverse shaft supported by the body of the combine forwardly of the shaft and straw outlet the attachment including in combination a chaff and straw collector having a plurality of aligned tines for collecting and dumping said chaff and straw in windrows pivotally supported by said transverse shaft beneath the straw outlet, said collector being pivotal between an elevated collecting position and an inclined dumping position a lever arm connecting to the collector for pivotal motion in unison therewith, a second lever pivotally supported upon the combine draw bar, means connecting said levers at points spaced from the pivot points thereof so that said levers move in unison, and latch means connected to said second lever for holding said levers in position to hold said collector elevated.

---



2,774,210

## GRAIN SAVING SHIELD FOR COMBINES

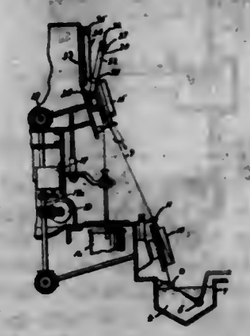
Reuben Kay, Blair, Nebr.

Application October 15, 1953, Serial No. 386,321

2 Claims. (Cl. 56—158)

1. In a combine having a frame, a transverse auger rotatably attached to said frame, a forwardly opening scoop attached to said frame and having a transversely disposed rearward wall, said rearward wall having an upper edge and having an opening therethrough, a grain conveyor disposed behind said auger and beneath the upper edge of said rearward wall and extending forwardly and rearwardly, the forward end of said conveyor extending into said opening in said rearward wall whereby grain escapes from said forward end of said conveyor; a shield having a rearward end pivotally connected to the upper edge of the rearward wall of said scoop and extending forwardly and downwardly over the exposed forward end of said conveyor and over the central portion of said auger and partially around the forward side of said auger to direct grain downwardly to said auger for the saving of grain and for protection of the operator against blowing chaff.

---



2,774,211

## MULTIPLE STRAND SPINNING MACHINE

Everett T. Sipsey, Drexel Hill, Pa., assignor to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware

Application October 8, 1951, Serial No. 250,241

7 Claims. (Cl. 57—34)

1. In a machine for spinning a plurality of strands, a separate receiver for collecting each strand into a separate package, two spaced sets of rotors, each rotor having a peripheral surface adapted to store a plurality of wraps of a strand, each set of rotors being disposed in a generally straight alignment parallel to the alignment of the other set whereby strands traveling from the rotors of one set to respective strand-receiving rotors of the other set traverse parallel substantially stationary paths and are discharged from the latter set of strand-receiving rotors toward said receivers, said rotors being arranged to advance each strand from a rotor of one set to a rotor of the other set in a single pass and one direction only along respective paths, means for driving said strand-receiving rotors at equal peripheral speeds; mechanism for severing the strands simultaneously comprising an elongate means extending in a direction generally parallel to the alignment of the sets of rotors and between the two sets in closely spaced lateral relationship with said paths, severing elements mounted on the elongate means, means for moving the elongate means to carry the elements substantially simultaneously through said paths, counting means connected in synchronism with the strand-receiving rotors for measuring the rotation thereof, and control means in connection with the counting means and the means for moving the elongate means, said control means being actuated by the counting means when a predetermined amount of rotation of the strand-receiving rotors has occurred.

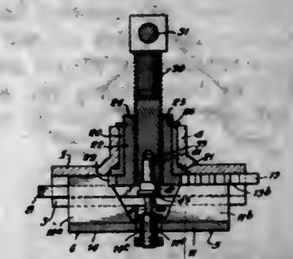
2,774,212



## CHAIN TOOL WITH SINGLE DRIVE MEANS FOR PUNCH AND CLAMP

Arthur W. Jacobs, Chicago, Ill.

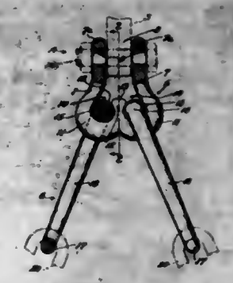
Application February 12, 1953, Serial No. 336,593

6 Claims. (Cl. 59—7)

1. A chain tool comprising a base member, guides on said base member, a pair of generally U-shaped chain gripping jaw members slidably mounted within said guides, a rotatable means on said base member between said guides, cooperating means on said rotatable member and said jaw members for causing said jaws to be moved towards and away from each other upon the rotation of said rotatable means, a rod in threaded engagement with said rotatable member, said rod being adapted for rotation through said rotatable member, said threaded engagement being effective to cause rotation of said rotatable means in response to rotation of said rod therethrough, a pin carried by said rod between said jaw-members and adapted, upon continued rotation of said rod, to contact the work between said jaw members the

power necessary to rotate said rod relative to said rotatable means being greater than the power necessary to rotate said rotatable means relative to said jaw-members whereby initial rotation of said rod is effective to cause rotation of said rotatable means.

---



2,774,213

## CLEVIS WITH TWO POSITIONED SPACED LINK

Ray D. Gantz, Columbus, Ohio, assignor to The Carroll Chain Company, Columbus, Ohio, a corporation of Ohio

Application September 28, 1955, Serial No. 537,093

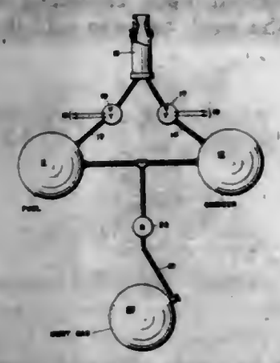
3 Claims. (Cl. 59—84)

3. As a new article of manufacture, a shackle for fastening chain, comprising: a generally U-shaped body symmetrical about a plane passing longitudinally and centrally therethrough; said shackle body being formed at one end thereof with a pair of relatively spaced side arms which terminate in transversely spaced apertured eyes defining a sole entrance for the positioning of end links in said shackle; said arms at the opposite end of the shackle merging into an integral arcuate loop; a lug having an enlarged outer end integrally formed with said loop; said lug projecting into said shackle and occupying a central longitudinal position therein; said lug forming in connection with the inner surfaces of said loop on opposite sides of the lug a pair of link-seating pockets, the latter having link entrances establishing communication between the interiors of said shackle and said pockets, the width of each of said entrances being less than the diameter of each pocket.

---

2,774,214

## ROCKET PROPULSION METHOD

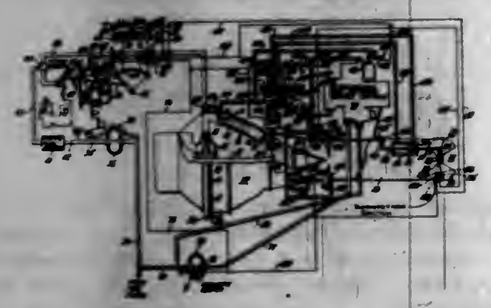


Frank J. Malina and John W. Parsons, Pasadena, Calif., assignors to Aerojet-General Corporation, Cincinnati, Ohio, a corporation of Ohio

Application September 1, 1950, Serial No. 182,742, which is a division of application Serial No. 486,236, May 8, 1943, now Patent No. 2,573,471, dated October 30, 1951. Divided and this application February 8, 1954, Serial No. 412,196

3 Claims. (Cl. 60—35.4)

1. The method of producing thrust which comprises ejecting, from a reaction chamber, the gaseous products produced by the spontaneous combustion of an oxidizer

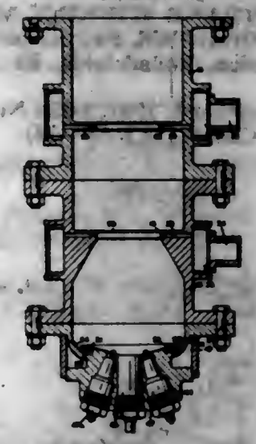


selected from the group consisting of red fuming nitric acid, white fuming nitric acid and nitrogen dioxide; and

a heterocyclic nitrogen compound selected from the group consisting of pyrrole and pyridine.

---

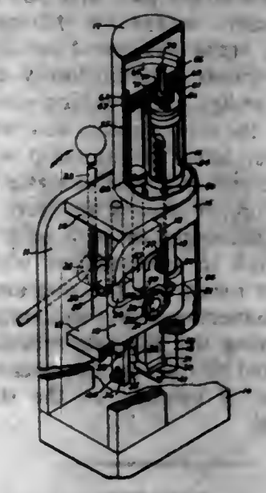
2,774,215
TAILPIPE OR AFTERBURNING CONTROL FOR TURBOJET ENGINES
Frank C. Mock and Thomas J. Thompson, South Bend, Ind., assignors to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application April 22, 1949, Serial No. 89,054
35 Claims. (Cl. 60—35.6)



18. In a thrust augmentation system for a turbojet engine having a compressor, a burner and a tailpipe chamber, means for regulating the flow of fuel to said tailpipe chamber including a fuel conduit having a feed restriction therein, a valve for regulating the flow of fuel through said restriction, a pressure-responsive device operatively connected to said valve, means for subjecting said device to a pressure varying as a function of compressor discharge pressure, and means operable as a function of a temperature which varies with variations in compressor inlet temperature for modifying the pressure to which said device is subjected, whereby the flow of fuel through said restriction to said tailpipe chamber varies as required.

---

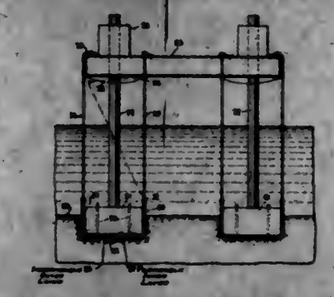
2,774,216
ROCKET MOTORS
Sidney Allen, Coventry, England, assignor to Armstrong Siddeley Motors Limited, Park Side, Coventry, England
Application November 12, 1952, Serial No. 319,832
Claims priority, application Great Britain January 21, 1952
3 Claims. (Cl. 60—35.6)



1. A rocket motor comprising a number of coaxial rings secured to one another and providing a preheating chamber upstream of the combustion chamber of the motor, the motor being designed to operate on a liquid fuel and a liquid oxidizer as propellent, a heating means at the upstream end of the preheating chamber including means for supplying a small portion of the fuel and the oxidizer and an igniter to ignite said small portions of fuel and oxidizer, a constriction provided by the walls of the preheating chamber downstream of the heating means, means for supplying a first portion of the rest of the oxidizer to spray holes in the wall providing the constriction, a further constriction in the preheating chamber

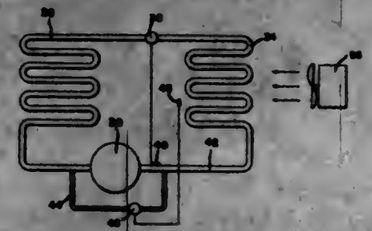
downstream of said first-mentioned constriction provided by a baffle, means for supplying the rest of the oxidizer to spray holes in said baffle, a burner at the upstream end of the combustion chamber, and means for supplying the rest of the fuel to said burner.

---



2,774,217
THRUST-PRODUCING APPARATUS SUCH AS PRESSES AND THE LIKE
Philip E. Ashton, Meriden, Conn.
Application July 5, 1950, Serial No. 172,159
26 Claims. (Cl. 60—54.5)

1. A thrust producing device comprising, in combination, a supporting frame, a thrust member mounted thereon for movement relative thereto, power-transmission means carried by said frame and movable relative thereto, said power-transmission means having a member in engagement with said thrust member for imparting an initial force thereto, thrust-multiplying means carried by said frame having a portion connected to, and operable by movement of, said power-transmission means to impart a multiplied thrust to said thrust member, said power-transmission means being moved by reaction of the said initial force imparted by said member to said thrust member whereby said thrust-multiplying means imparts a multiplied thrust to said thrust member.

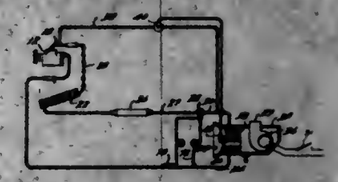


2,774,218
METHODS AND MEANS FOR FACILITATING REMOVAL OF OFFSHORE PLATFORM SUPPORTS FROM MUD
John T. Hazak, New York, N. Y., assignor to Raymond Concrete Pile Company, New York, N. Y., a corporation of New Jersey
Application November 18, 1955, Serial No. 547,809
13 Claims. (Cl. 61—46.5)

1. Apparatus for facilitating removal of the bottom end portion of a supporting member of a marine platform from contact with the mud on the ocean floor, which comprises a support end cover formed of flexible, water impermeable material adapted to receive such end portion of said supporting member, in combination with means to introduce fluid under pressure substantially uniformly over the space between said end portion and said cover, thereby substantially eliminating any suction forces existing therebetween when such end portion is being raised from the mud.

---

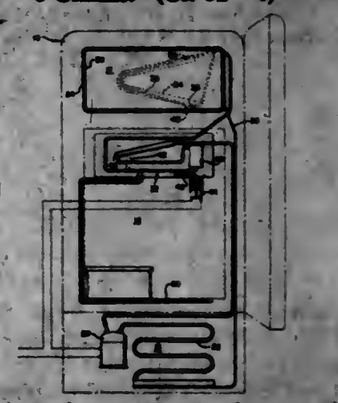
2,774,219
AUTOMOBILE REFRIGERATING APPARATUS
Curtis P. Kelley, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application October 27, 1954, Serial No. 465,094
7 Claims. (Cl. 62—3)



1. In an air conditioning system, a compressor, a condenser, an evaporator contacted by flowing air, refrigerant flow connections between said compressor, condenser, and evaporator, a thermostatic expansion valve in said connections adjacent the inlet of said evaporator, said thermostatic expansion valve including thermal means responsive to the temperature at the outlet of said evaporator for controlling the flow of refrigerant through said valve, means responsive to the temperature of the air flowing away from the evaporator for preventing operation of said evaporator whenever the evaporator is at a temperature below the freezing temperature of condensation which might form thereon, said last named means comprising means for applying heat to said thermal means sufficient to actuate said valve in response to a predetermined decrease in the temperature of air leaving said evaporator.

---

2,774,220
CONTROL FOR A REFRIGERATION SYSTEM
Raymond S. Heyn, Birmingham, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Application July 23, 1953, Serial No. 369,761
1 Claim. (Cl. 62—3)

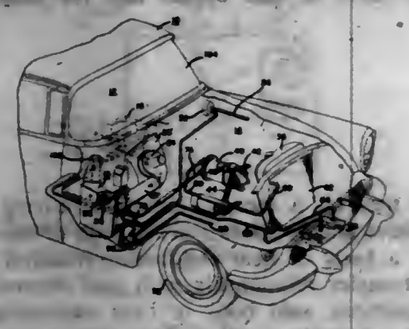


In a refrigerating system of the compressor, condenser and evaporator type having an air duct, said evaporator being positioned in said duct, air propelling means associated with said duct and operable to induce a circulation of air through said duct and over said evaporator, control means for selectively rendering said air propelling means operative and inoperative, an expansion valve interposed between the condenser and evaporator and a bypass line for delivering uncondensed refrigerant to a point in the circuit between the expansion valve and the evaporator, the combination of a thermal bulb responsive valve in said bypass line for controlling the

capacity thereof, a thermal bulb operatively connected to said valve and positioned in the path of the circulating air, and a body of heat conducting material positioned in heat transfer relationship with said thermal bulb and said evaporator, said body of heat conducting material having a relatively small surface area as compared to the surface area of said thermal bulb so that when said air propelling means is operating the air temperature is the controlling factor in determining the temperature of said thermal bulb.

---

2,774,221
TWO-TEMPERATURE REFRIGERATING SYSTEM
John H. Heldorn, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application July 14, 1953, Serial No. 367,867
6 Claims. (Cl. 62—4)



6. In a refrigerating system having a pair of evaporators connected in series wherein the last of said evaporators is adapted to be defrosted cyclically, means forming a pair of insulated compartments for separately enclosing said evaporators, an accumulator for momentarily storing overflow refrigerant from said first evaporator section before being supplied to said second evaporator section, said accumulator comprising an outer receptacle having an inlet connected to said first evaporator section, an outlet tube for conveying liquid refrigerant from said accumulator to said second evaporator section, said outlet tube being arranged to enter the upper end of said receptacle and extending downwardly into the lower end thereof and having a vent hole provided in its wall adjacent the upper end of said receptacle.

---

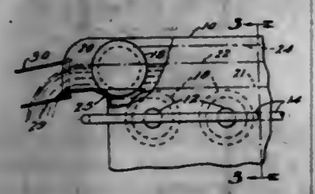
2,774,222
VEHICLE REFRIGERATING APPARATUS
James W. Jacobs and Daniel J. Barbolesco, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application May 19, 1954, Serial No. 430,890
7 Claims. (Cl. 62—4)

1. In combination with a vehicle having a passenger compartment and an engine compartment, an engine with-

in said engine compartment for propelling said vehicle, a windshield forming a portion of the front wall of said passenger compartment, a compressor, means for transmitting power from said engine to said compressor, a condenser, an evaporator, and refrigerant flow connections between said compressor, condenser, and evaporator, means for circulating air for said passenger compartment in thermal exchange relationship with said evaporator, an auxiliary air cooling unit for cooling air for one portion

of said passenger compartment, means for circulating a heat transfer liquid between said evaporator and said auxiliary air cooling unit, duct means for directing the air cooled by said evaporator into the forward portion of said passenger compartment, and air directing baffle means at the outlet of said duct means operable to selectively direct the outgoing air either onto said windshield or rearwardly away from the lower edge of said windshield.

---



2,774,223

## ICE MAKING METHOD AND APPARATUS

Glenn Muffly, Springfield, Ohio

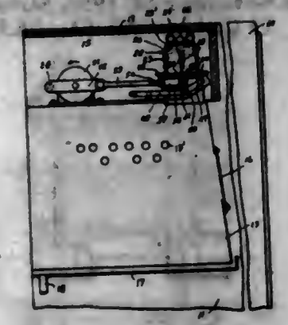
Application July 20, 1950, Serial No. 174,944

15 Claims. (Cl. 62—7)

1. The method of forming a plurality of relatively thick pieces of ice between adjacent wetted surfaces facing each other by cooling a plurality of small areas of each of said surfaces to form separate pieces of ice thereon, causing water to flow over the ice while forming on said cooled areas, continuing said cooling until the pieces of ice which have formed on a pair of opposed areas have increased in thickness until they have made contact with each other and frozen together at thicker sections of each piece to form a double-thickness solid piece of ice, and then releasing the last said piece of ice from said surfaces.

---

2,774,224



## ICE CUBE MAKING REFRIGERATOR

John R. Bayston, Encino, Calif., assignor to John R. Bayston, trustee, Icecrafter (Liquidating) Trust, Encino, Calif.

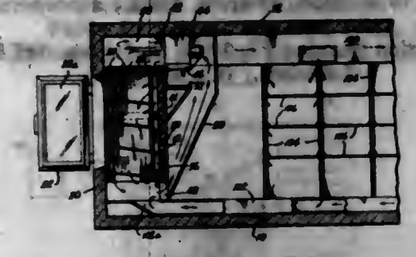
Application January 31, 1955, Serial No. 484,925

9 Claims. (Cl. 62—7)

1. A refrigerator having a food compartment and an ice bin located therein to receive ice cubes for refrigeration thereof, an evaporator including an inverted cell open at the bottom and positioned to discharge ice cubes into said bin, means controlled by the temperature to alternately generate a freezing cycle and a defrosting cycle in said evaporator, a header movable into and out of evaporator closing position having a water passage communicating with a nozzle orifice positioned centrally of said cell through which water is sprayed upwardly therein during the freezing cycle, said header having a return channel communicating with said cell for receiving unfrozen water, a water tank in said header connected with said return channel having a source of water supply, a motor driven pump mounted on said header having its

intake side connected with said tank for circulating water under pressure through said passage into said cell during the freezing cycle, a motor controlled by said means operably connected to said header for reciprocating it between evaporator opening and closing positions, and a guide for initially tilting said header downwardly and transversely free of said evaporator to opening position.

---



2,774,225

## REFRIGERATED FOOD DISPLAY CABINETS

Frank C. Grilley and Morris M. Smith, Tacoma, Wash., assignors to Room-Temp Lockers, Inc., Tacoma, Wash., a corporation of Washington

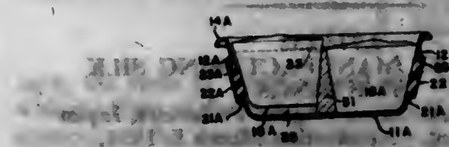
Application August 19, 1955, Serial No. 529,539

10 Claims. (Cl. 62—89.5)

1. A refrigerated article storage case comprising top, bottom, rear and opposite-end outer walls forming an insulating closure, said closure having a front wall including at least one access door therein permitting access into said closure, top, rear and opposite-end inner walls mounted in said closure at respective locations spaced inwardly thereof from the corresponding outer walls, thereby to form a storage compartment accessible through said door, and thereby also to form top, rear and opposite-end wall air ducts between corresponding outer and inner walls of said closure, said inner walls comprising rigid material panels of perforate form permitting passage of air freely therethrough over substantially their entire area adjoining said storage compartment, a plurality of perforate storage racks mounted generally horizontally in said storage compartment at successively different heights therewithin to support refrigerated articles thereon to be stored, means for introducing refrigerated air into the top wall duct and into the upper ends of the rear and opposite-end wall ducts, means to withdraw refrigerated air from the bottoms of said rear and opposite-end air ducts and from the bottom of said storage compartment, and baffle means extending generally horizontally across substantially the full widths respectively of said rear and opposite-end wall ducts generally intermediate the tops and bottoms thereof for blocking descent of refrigerated air therein, thereby to divert such air through said perforate rear and opposite-end inner walls into said storage compartment above said baffles and to

induce the withdrawing of refrigerated air into said rear and opposite-end wall air ducts below said baffles by said withdrawal means.

---



2,774,226

## FREEZING DEVICE

Edmund F. Schweller, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application December 6, 1954, Serial No. 473,107

2 Claims. (Cl. 62—108.5)

1. A freezing device comprising, an elongated sheet metal tray provided with a row of compartments in which water is to be frozen into separated ice blocks, said tray having an uninterrupted continuously flat bottom adapted to be supported on a freezing member whereby to retain the fast freezing characteristics of the metal tray, at least one wall of each of said compartments being inclined outwardly from said bottom of the tray to the top thereof, an upright side wall of said tray having spaced apart openings therein each opposed to the said one wall of said compartments, the edge portion of said tray side wall adjacent openings therein being flanged outwardly and forming a depression therein, a resilient membrane in each opening in said tray side wall and interlocked with said edge portion of said openings, said membranes filling said depressions and having their inner surface flush with the inner surface of said tray side wall, said membranes being exposed at a side of said tray, said membranes being manually flexed one at a time in succession throughout the length of said tray toward an inclined wall of a compartment to selectively pry a single ice block thereagainst, and said prying action shifting said single ice block in a straight line direction upwardly along said inclined wall to position a portion of said single ice block above a compartment wall while leaving other ice blocks in said device bonded to said tray.

2,774,227

## AIR CONDITIONING APPARATUS FOR BUSES AND THE LIKE

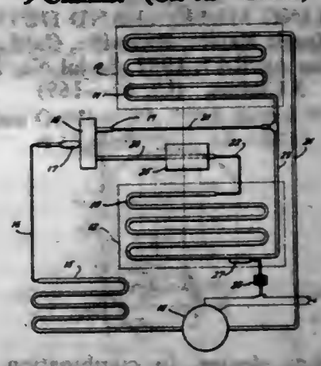
Hans O. Schjolin and Karl Schuster, Birmingham, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application July 23, 1953, Serial No. 369,910

10 Claims. (Cl. 62—117)

2. In combination, a passenger vehicle having a passenger compartment; means forming a machinery compartment adjacent said passenger compartment; air conditioning apparatus for cooling the air in said passenger compartment; said air conditioning apparatus including an evaporator, a compressor, a condenser and refrigerant flow connections between said evaporator, compressor and condenser; said compressor and condenser being mounted in said machinery compartment; means for supporting said condenser adjacent an outside wall of said vehicle; an engine for driving said compressor; said engine having a main crankshaft extending substantially parallel to the side wall of said vehicle; a power take-off shaft projecting from said engine at right angles to said shaft; a condenser cooling fan having a shaft arranged parallel to said power take-off shaft and perpendicular to said condenser; and means for drivingly connecting said shaft to said power take-off shaft, said condenser being mounted between the one side of said vehicle and said condenser fan; control means for said engine including a first ignition switch mounted in said machinery compartment and a second ignition switch mounted within said passenger compartment; a door for said machinery compartment; and means whereby closing of said door opens the first of said ignition switches.

---



2,774,228

## PLURAL TEMPERATURE REFRIGERATORS

Farough Farnam Farnsaien, Philadelphia, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania

Application October 30, 1953, Serial No. 389,430

9 Claims. (Cl. 62—117.3)

1. In a refrigerating system of the type including refrigerant circulating means, expansion means, evaporator means, and means defining a pair of alternative flow paths interconnecting said expansion means and said evaporator means, flow control apparatus effective to cause refrigerant to flow toward said evaporator means through one of said paths under one condition of operation, and effective to cause refrigerant to flow toward said evaporator means through the other of said paths under another condition of operation, said flow control means comprising: a body of material of relatively high thermal mass associated in heat exchange relation with one of said paths and being disposed to absorb heat from the ambient atmosphere during periods of idleness of said circulating means, the construction and arrangement being such that heat passes from said body to the path disposed in heat exchange relation therewith and is effective to evaporate liquid refrigerant flowing through the latter path whereby to vapor-block the same for the period of time, following initiation of operation of said circulating means, required to cause the temperature of said body closely to approach the temperature of the refrigerant flowing through the said path, whereby the flow of liquid refrigerant through the said path is delayed for a period of time which is a function of the quantity of heat contained in said body.

---

2,774,229

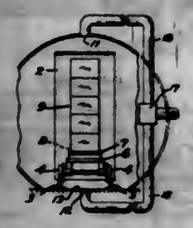
## DRAFT BEER DISPENSER

Karl Thaa, Towson, and August Kiel, Sr., Baltimore, Md., assignors to Kay-Tee Corporation, a corporation of Maryland

Application July 25, 1955, Serial No. 523,957

3 Claims. (Cl. 62—141)

1. A draft beer dispenser comprising a cabinet having an upper compartment and a lower compartment sep-



arated by a horizontal partition, a refrigeration unit having its compressor and condensing coil positioned in the upper compartment and its expansion coil positioned in the lower compartment, a high pressure carbon dioxide cylinder mounted within the cabinet, and extending through said horizontal partition, a reducing valve con-

nected to the outlet of said cylinder, a pipe leading from said reducing valve and adapted to be connected to a keg positioned in said lower compartment, a spigot mounted in said upper compartment and a pipe extending from said spigot into said lower compartment and adapted to be connected to said keg.

---

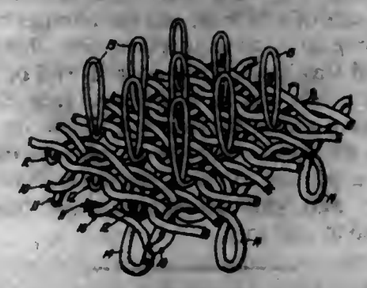
**2,774,230**
**COOLING METHOD AND DEVICE**
Morris Kaner, Roseville, Calif.
Application April 17, 1952, Serial No. 284,836
3 Claims. (Cl. 62—169)

1. In a cooling device, in combination, a stack of closed boxes containing a produce to be cooled and having vent openings arranged on opposite walls of said boxes for directing cross draft in said boxes, a vacuum chamber, a carriage to carry said stack or boxes into and out of said vacuum chamber, means on said carriage to permit access to the bottom of said stack of boxes, said vacuum chamber having ports at opposite walls thereof, and suction means to draw a vacuum in said chamber through said ports so as to produce a draft through said boxes and said produce for evaporating moisture present on said produce.

---

**2,774,231**
**MOUNTING HAVING A LARGE CENTRAL GEM OVERLYING ADJACENT SMALL GEMS**
Henry Petersen, New York, N. Y.
Application December 28, 1953, Serial No. 400,714
6 Claims. (Cl. 63—28)

1. A mounting for a diamond or the like, comprising a top plate having a relatively large opening formed therethrough at approximately its center and adapted to seat a relatively large diamond and means on the surface of said top plate for holding said diamond in place, said top plate having a plurality of relatively smaller openings formed therethrough, evenly, sparsely and circumferentially disposed around said larger central opening, each adapted to seat a diamond of relatively smaller size having a central flat top section, in position to have said smaller diamond underlie and abut the underside of said larger diamond, with said larger diamond overlying a part of said flat top section of each of said smaller diamonds, and means adjacent to each of said smaller openings for holding a smaller diamond in place therein, said top plate having a smooth, concaved, light reflecting surface extending radially inwardly toward said larger central opening and curving upwardly away from and surrounding and extending beyond each of said smaller openings and the smaller diamond set thereinto.



---

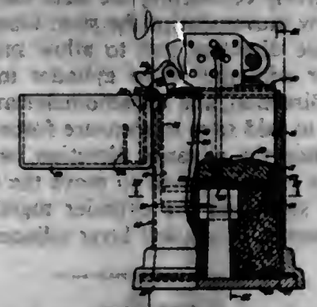
**2,774,232**
**METHOD OF MANUFACTURING SILK STOCKINGS**
Hisashi Kakizaki, Suwa, Nagano Prefecture, Japan
No Drawing. Application March 5, 1951, Serial No. 214,017
Claims priority, application Japan June 9, 1950
4 Claims. (Cl. 66—178)

1. The method of manufacturing hose substantially from raw silk fibers, comprising the steps of knitting raw silk fibers previously treated to fix sericin therein to thereby obtain a major part of said hose, and then knitting previously degummed raw silk fibers to attain the remainder of said hose, whereby said remainder of said hose presents elasticity and flexibility relatively higher than said major part of said hose.

---

**2,774,233**
**KNITTED TERRY FABRICS**
Vincent Lombardi, Miami, Fla.
Application July 12, 1952, Serial No. 298,565
12 Claims. (Cl. 66—191)

1. Knitted terry fabric comprising main yarn and wrap yarn and having a plural-wale and plural-course portion comprising said main yarn and said wrap yarn, and portions at the sides of the first-mentioned portion comprising said main yarn but not said wrap yarn, at least one of said yarns being knitted in the first-mentioned portion and said main yarn being knitted in the last mentioned portions, and at least one of said yarns being drawn into terry loops in said first-mentioned portion.



---

**2,774,234**
**TABLE LIGHTER**
George G. Blaisdell and Lester Flickinger, Bradford, Pa., assignors to Zippo Manufacturing Company, Bradford, Pa., a corporation of Pennsylvania
Application January 12, 1954, Serial No. 403,611
6 Claims. (Cl. 67—4.1)

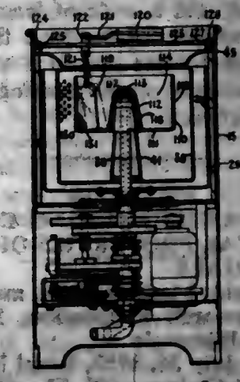
3. A table lighter of the type in which an insert body carrying the lighter mechanism is inserted in a table body having a fuel reservoir, the improvement which comprises: the table body having a top wall and side walls, a pair of inner partitions depending from the top wall, the partitions being spaced inwardly from the side walls of the table body to provide fuel reservoirs, and an insert body inserted between the inner partitions, the inner partitions being spaced apart such a distance as to closely engage the sides of the insert body, the insert body being

provided with a wick surrounded by absorbent material, and said fuel reservoirs being filled with an absorbent material, the table body having a U-shaped auxiliary

wick, the arms of which extend into the reservoirs, and with the bight of the U being in contact with the absorbent material of the insert body to make fuel from the body reservoirs available to the wick of the insert body.

---

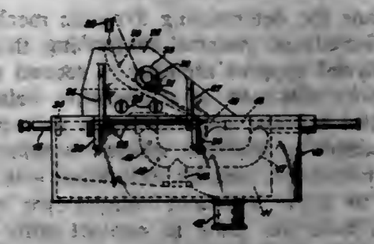
**2,774,235**
**BURNER FOR CIGARETTE-LIGHTERS AND CIGARETTE-LIGHTERS PROVIDED THEREWITH**
Theodor Raetz, Marstetten, Switzerland
Application December 19, 1955, Serial No. 554,014
Claims priority, application Switzerland June 27, 1955
12 Claims. (Cl. 67—53)



1. In a cigarette lighter provided with a fuel burner head and a tightly closed inner fuel reservoir for vaporizable fuels, the combination of a tubular member mounted inside said reservoir, lower and upper openings in said member, wick elements positioned in said lower openings with a tight fit therein, said elements having one end positioned in the fuel reservoir and extending through said tubular member to said upper opening, means mounted in said upper opening to retard the flow of fuel from said wick elements, said means forming the burner head, and means connecting said tubular member and fuel reservoir for transmitting to said wicks the pressure prevailing above the fuel level in said reservoir.

---

**2,774,236**
**FOOD MIXING ATTACHMENT FOR DOMESTIC WASHING MACHINE**
George Gill, Annie Kathleen Gill, and George Jeffrey Gill, Pudsey, near Leeds, England, assignors to Fisher & Ludlow Limited, Birmingham, England, a British company
Application April 21, 1954, Serial No. 424,664
2 Claims. (Cl. 68—4)



1. In a domestic washing machine of the type comprising a power driven driving element rotatable about a substantially vertical axis within an outer stationary open mouthed casing, the provision of a food mixing attachment comprising the combination of a food-stuffs containing bowl having a driving portion adapted for detachable engagement with said power driven driving element and a tool supporting member with a pair of differently arranged tools mounted on opposite sides of said tool supporting member, means being provided on opposite sides of said casing mouth for mounting said supporting member detachably on said casing in a position in which

said tool supporting member extends across said mouth and in two alternative positions in which one or the other of said tools depend from said supporting member into the interior of said bowl to co-act therewith.

---

**2,774,237**
**JET BOX**
Ernest J. Griset, Jr., Asheville, N. C., assignor to American Enka Corporation, Enka, N. C., a corporation of Delaware
Application October 27, 1954, Serial No. 465,019
4 Claims. (Cl. 68—181)

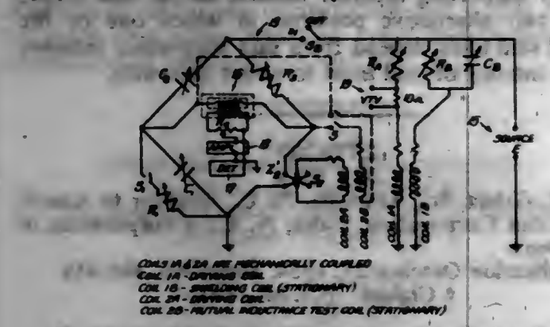
1. A spinning in unit for a tube spinning machine comprising a box, a transparent jet-tube unit, said tube having a yarn receiving mouth spaced from said jet, quick detachable means to support said unit within said box, a deflector having a yarn guiding groove therein and a hinged side wall of said box supporting said deflector for movement from a normal position above said unit with its groove leading to said mouth to a position affording visual and manual access to said unit.

---

**2,774,238**
**FREEZE-TESTER**
Larry L. Gerwig, Elmira Heights, N. Y., assignor to Bendix Aviation Corporation, Elmira Heights, N. Y., a corporation of Delaware
Application June 4, 1952, Serial No. 291,732
8 Claims. (Cl. 73—17)

1. In a freeze-tester for liquids, a metallic freezing rod, a transparent sheath mounted on the rod in spaced rela-

tion thereto with freedom for relative movement, a heat reservoir connected to one end of the rod, a source of cooling medium, means for bringing the cooling medium into intimate thermal contact with the other end of the rod, means for wetting the surface of the rod with the liquid to be tested, and a scale of length of the rod for determining the position of the frost line on the rod in relation to the ends of the rod; said transparent sheath being mounted coaxially on the freezing rod with a capillary space therebetween.



---

2,774,239

## TAILPIPE OR AFTERBURNING CONTROL FOR MECHANICAL PROPERTIES OF VISCOELASTIC MATERIALS

Edwin R. Fitzgerald, Madison, Wis., assignor to Wisconsin Alumni Research Foundation, Madison, Wis., a corporation of Wisconsin

Application July 26, 1952, Serial No. 301,061
24 Claims. (Cl. 73—67)

18. Means for determining dynamic mechanical properties of viscoelastic material comprising, in combination, a first material support member, a second material support member disposed in cooperative relation to said first material support member so as to receive therebetween a sample of material whose viscoelastic properties are to be measured, means cooperating with said support members to apply sufficient compressive stress to said sample to hold the same in contact with said support members without slipping when the same are oscillated relative to each other sufficiently to apply shearing stress to said sample, wire tension means individual to each of said support members for mounting the same for translatory movement in space substantially free of friction, means for translatorily moving said support members relative to each other to apply shearing stress to the sample of material, and means for measuring such movement.

---

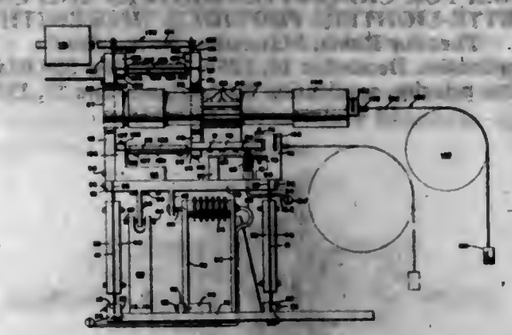
2,774,240

## SOIL TESTING APPARATUS

Hans Beat Fehlmann, Bern, Switzerland, assignor to A. G. für Grundwasserbauten, Bern, Switzerland

Application April 1, 1952, Serial No. 279,892
Claims priority, application Switzerland April 9, 1951
5 Claims. (Cl. 73—84)

1. An apparatus for the step-by-step determination of the skin resistance of a series of soil layers comprising a probe cylinder to be advanced into the soil, a stem of smaller diameter than said cylinder, means to drive the stem and cylinder into a soil layer, lost motion coupling means operatively connecting the stem and the probe cylinder to allow movement of the stem alone in other than in the advance direction and to allow movement of the stem together with the probe cylinder in other than in the advance direction, and dynamometer means operatively connected to said stem to measure forces applied thereto in other than the advance direction, whereby the difference in the force required to move the stem alone and to move the stem and the cylinder together determines the skin resistance of the soil layer adjacent the cylinder.



---

2,774,241

## WEIGHT MEASURING, THRUST DETERMINING APPARATUS

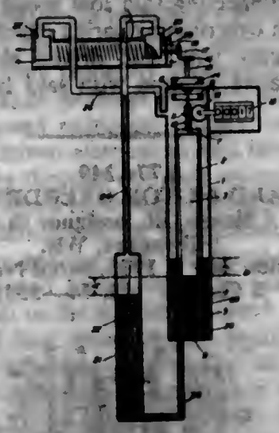
Lowell W. Bennett, Derwood, Md., assignor to the United States of America as represented by the Secretary of the Navy

Application October 4, 1954, Serial No. 460,288
2 Claims. (Cl. 73—116)

1. A weight measuring, thrust determining arrangement for simultaneously determining the loss of weight of a missile propellant as well as the thrust developed by the propellant during the burning thereof as a function of time, comprising, means including a plurality of leaf springs for supporting a missile motor having a propellant therein and for maintaining said missile motor substantially horizontally during burning of said propellant, means for sensing and indicating the horizontal displacement of said missile motor during burning of said propellant, means including a second plurality of leaf springs for vertically supporting said missile motor, and means for sensing and indicating the vertical displacement of said missile motor as a function of the burning of the propellant therein.

---

2,774,242



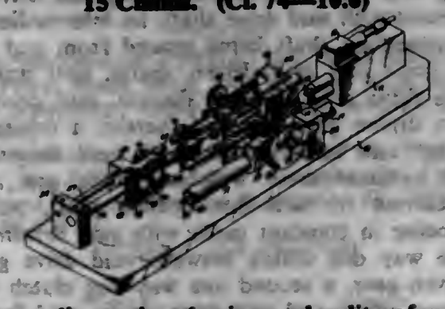
## CALORIMETER

Adam Wesp, Messenhausen, Germany, assignor to VDO Tachometer Werke, Adolf Schindling G. m. b. H., Frankfurt am Main, Germany, a corporation of Germany

Application June 17, 1954, Serial No. 437,423
Claims priority, application Germany June 17, 1953
12 Claims. (Cl. 73—193)

1. A calorimeter for central heating installations adapted to measure the product of the volume of the heat carrier flowing through such installation and the temperature difference between the inflow and the outflow of such installation, said calorimeter comprising a gas-filled chamber in the inflow and in the outflow portions of such installation, two interconnected closed vessels connected to said chambers, an inner and outer cylinder mounted for rotation within the first vessel, the outer cylinder having openings communicating with said first vessel, a liquid partially filling said first and second vessels and said outer cylinder, an impeller disposed in the inflow portion of such installation provided with means for driving said inner cylinder, said outer cylinder being actuated by the liquid coupling said cylinders and a counting mech-

anism connected to said outer cylinder upon which the revolutions of said outer cylinder are registered.



---

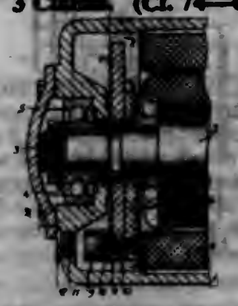
2,774,243

## TUNING MECHANISM FOR RADIO RECEIVERS

Frank J. Skwarek, Westbury, N. Y., assignor to Polarad Electronics Corporation, Brooklyn, N. Y., a corporation of New York

Application February 1, 1955, Serial No. 485,515
15 Claims. (Cl. 74—10.6)

1. In a radio receiver having a plurality of preselector stages, each stage having a reciprocable tuning element, in combination, a shaft, a cam mounted on said shaft, a reciprocable cam follower cooperating with said cam, said follower being mounted on a slide and spring-pressed against said cam, a block on said slide, rods connected to the tuning elements mounted in bores in said block, means mounted on said block and bearing against said rods to transmit movement of said block to the tuning elements simultaneously, and means for individually varying the movement of said transmitting means and of said rods.



---

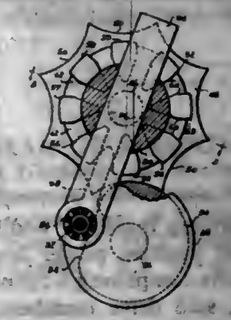
2,774,244

## VARIABLE AMPLITUDE VIBRATOR

Ernst Rune Bergström, Trollbacken, Nils Rune Fagerqvist, Kläston, and Åke Oskar Martin Norrman, Alvsjo, Sweden, assignors to Vibro-Plus Corp., Woodside, N. Y., a corporation of Delaware

Application June 2, 1954, Serial No. 434,026
3 Claims. (Cl. 74—61)

3. In a variable amplitude rotary vibrator the combination of a shaft, an eccentric mass secured to said shaft, a relatively adjustable eccentric mass rotatably mounted on said shaft for cooperation with said fixed eccentric mass, means axially movable to operative position for interlocking said eccentric masses, a casing housing said eccentric masses and accommodating said shaft, and an opening in said casing aligned with the axially movable interlocking means making said interlocking means accessible from the outside of the casing, said opening forming a socket adapated to receive a part of said interlocking means when the latter is axially moved to inoperative position to release said adjustable eccentric mass from said fixed eccentric mass, said interlocking means, when partly received in said socket, preventing relative rotation between said adjustable eccentric mass and said casing.



---

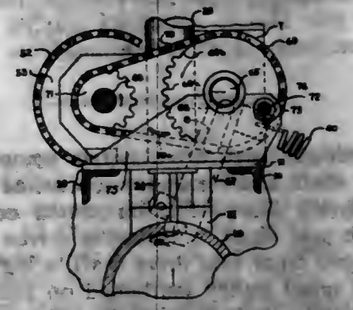
2,774,245

## INTERMITTENT MOTION DEVICE

Francis H. Shepard, Jr., Madison, N. J.

Application January 22, 1953, Serial No. 332,712
9 Claims. (Cl. 74—84)

1. In an intermittent motion device, a driving shaft, a driven shaft, means for mounting the shafts for rotation adjacent to each other, an inverted scallop wheel carried by the driven shaft for rotation therewith, a locking member formed with a circular periphery having a cutaway portion carried by the driving shaft for rotation therewith, the curvature of the periphery of the locking member corresponding to the curvature of each inverted scallop, a crankpin, means for mounting the crankpin on the driving shaft for rotation therewith, a driving member formed with a plurality of radially extending passageways carried by the driven shaft for rotation therewith, an elongated tooth having one end thereof rotatably carried by the crankpin and separate means for continuously orienting the axis of the elongated tooth to extend radially through the axis of rotation of said driving member.



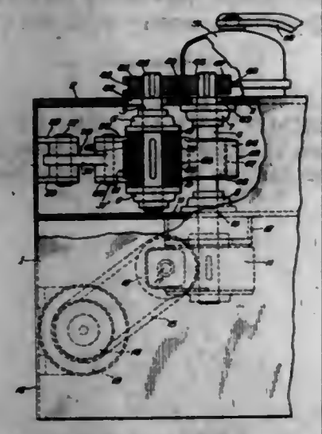
---

2,774,246

## INTERMITTENT DRIVE MECHANISM

Melvin J. Happe and Edwin B. Nolt, New Holland, Pa., assignors, by mesne assignments, to Sperry Rand Corporation, a corporation of Delaware

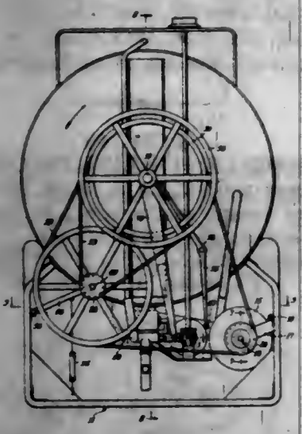
Application April 5, 1952, Serial No. 280,751
7 Claims. (Cl. 74—84)



1. Crusher roll release mechanism for a hay crusher comprising, a rotatably mounted shaft, a power drive mechanism including a drive chain, an incomplete sprocket wheel rotatable with said shaft, a portion of the pe-

riphery of said wheel being smooth and free of sprocket teeth, said drive chain being slidable disposed around said smooth portion of the wheel, releasable latch mechanism normally restraining said wheel against movement with said chain.

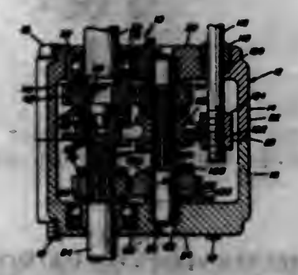
---



2,774,247
**DRIVE FOR METAL FORMING MACHINE**
Lloyd H. Knost, Carthage, Mo.
Application February 26, 1952, Serial No. 273,427
6 Claims. (Cl. 74—206)

1. In a metal forming machine, bodily movable forming roll shafts, and positive power transmission means connecting said shafts comprising a cylindrical drive member on each shaft, said drive members each having resilient cylindrical peripheral portions for direct face to face frictional driving contact, and said peripheral portions each being of a radial thickness greater than the maximum bodily movement of said shafts and radially distortable to permit said maximum relative bodily movement of said shafts toward and away from each other.

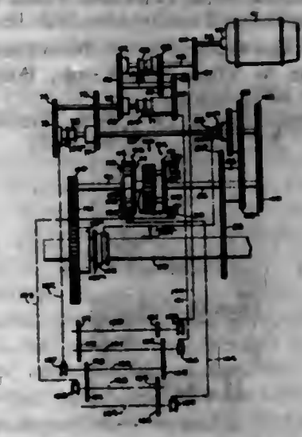
---



2,774,248
**MULTIPLE SPEED DRIVE SYSTEM**
Albert H. De Moss, Milwaukee, Wis.
Application May 7, 1953, Serial No. 353,490
12 Claims. (Cl. 74—217)

1. A multiple speed drive system comprising a rotatable drive shaft, a drive pulley journalled on said drive shaft, a spring biased friction clutch connecting said pulley with said shaft, a rotatable driven shaft parallel to and spaced from said drive shaft, a high speed pulley and a low speed pulley journalled on said driven shaft, an intermediate shaft parallel to and spaced from said drive and driven shafts, an intermediate high speed pulley and an intermediate low speed pulley ganged together and carried on said intermediate shaft, a belt connecting said drive pulley, said high speed pulley and said intermediate high speed pulley, a belt connecting said low speed pulley and said intermediate low speed pulley, an overrunning spring clutch connecting said low speed pulley with said driven shaft, an overrunning spring clutch connecting said high speed pulley with said driven shaft, and control means in operative relation with said last named spring clutch.

---

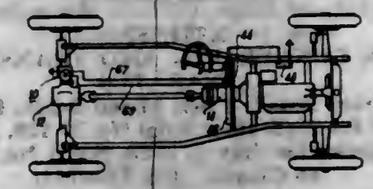


2,774,249
**OUTBOARD MOTOR OVERDRIVE UNIT**
Elliott Moline, Chicago, Ill., assignor to Frank L. Young, Milwaukee, Wis.
Application July 6, 1955, Serial No. 520,179
2 Claims. (Cl. 74—359)

1. An outboard motor overdrive unit having a drive shaft, with a reduced pilot on one end thereof a driven shaft, with a pilot hole in one end thereof, said pilot engaging said pilot hole and retaining said driven shaft in alignment with said drive shaft, an intermediate shaft, said intermediate shaft being spaced from and parallel to said drive and said driven shafts, said drive shaft having a drive gear attached thereto, said driven shaft having a driven gear attached thereto, a driven pinion carried by said intermediate shaft, said driven pinion being in constant mesh with said drive gear, a drive pinion carried by said intermediate shaft, said drive pinion being in constant mesh with said driven gear, a first one way dog clutch between said drive gear and said driven gear, a second one way dog clutch between said driven pinion and said drive pinion, said first clutch and said second clutch being positionable to selectively drive said driven shaft through said gears and through said gears and pinions, said clutches being interconnected and having a single operator.

---

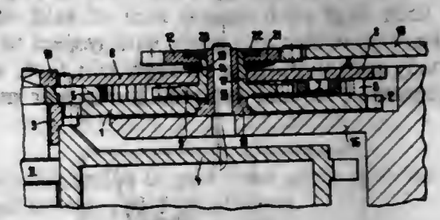
2,774,250
**MULTI-SPEED TRANSMISSION FOR MACHINE TOOLS**
Keith F. Gallimore, Fond du Lac, Wis., assignor to Giddings & Lewis Machine Tool Company, Fond du Lac, Wis., a corporation of Wisconsin
Application July 30, 1954, Serial No. 446,833
21 Claims. (Cl. 74—364)



1. In a machine tool, the combination of a multispeed transmission with a speed preselector device; said transmission comprising rotatable driving and driven elements, a fixed ratio speed reduction gearing, first and second speed change gearings each including a plurality of clutches shiftable between two positions to effect different speed change ratios, means tandemly connecting said first and second speed change gearings between said driving element and said speed reduction gearing, means drivingly connecting said driven element to said first speed change gearing optionally through (*a*) said second speed change gearing and said speed reduction gearing and (*b*) through said first speed change gearing independently of said second speed change gearing and said speed reduction gearing, the ratio of said speed reduction gearing being approximately equal to the maximum speed reduction ratio afforded by said first speed change gearing; and a preselector device including a plurality of rotatable and axially movable shifter shafts operatively connected with respective ones of said clutches to shift the latter upon axial movement of the former, and means for simultaneously and axially shifting those shifter shafts indexed to predetermined rotational positions according to a preselected pattern, whereby said driven element may have any one of a plurality of speeds when connected through said first speed gearing and a corresponding one of a plurality of speeds when connected through said speed reduction gearing, as determined by the preselected positional pattern of said clutches.

---

2,774,251
**TRANSMISSION OPERATING MECHANISM**
Earl R. Price, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Original application June 3, 1949, Serial No. 97,011, now Patent No. 2,695,983, dated November 30, 1954. Divided and this application September 16, 1954, Serial No. 456,430
5 Claims. (Cl. 74—365)



1. A power mechanism adapted to operate a change speed transmission of an automotive vehicle, said mechanism including an electric motor having a shaft, a casing, means within the casing comprising a worm gear and worm driving unit drivably connected to said shaft, a transmission operating rod, force transmitting means interconnecting the rod and worm gear including a disk directly connected to the rod and further including a spring interposed between the disk and the worm gear of said unit, said spring being energized when the motor is energized to effect an operation of the unit; cut off switch mechanism for in part controlling the operation of the motor, and means connected to the worm gear for operating the switch mechanism.

---

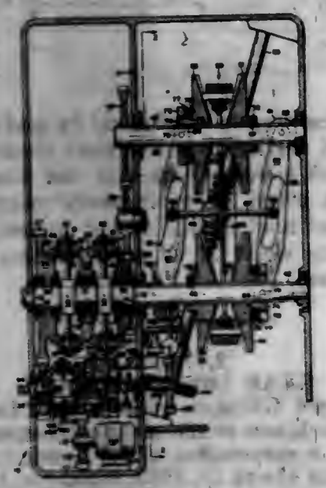
2,774,252
**DIFFERENTIAL GEAR**
Friedrich Meyer, Grenchen, Switzerland, assignor to Felsa S. A., Grenchen, Switzerland
Application July 26, 1955, Serial No. 524,342
Claims priority, application Switzerland September 4, 1954
3 Claims. (Cl. 74—674)

1. In a differential gear for timepiece movements, a first toothed transmission wheel having crown teeth extending laterally from the median plane of the wheel, a sleeve rigidly and coaxially connected with said first transmission wheel to extend towards the side of said crown teeth, a mover unit pivoted on said sleeve to be separated as a whole from said sleeve and comprising, a sun wheel axially supported by said first transmission wheel, a hub integral with said sun wheel, detachably pivoted on said sleeve and extending away from said first transmission wheel, a second toothed transmission wheel coaxially pivoted on said hub and held at a distance from

said first toothed transmission wheel by said crown teeth, a planet wheel carried by said second toothed transmission wheel and in mesh with said sun wheel and said crown teeth, a driven wheel coaxially mounted on said hub, and means holding said second transmission wheel and said driven wheel at an axial distance from each other on said hub.

---

2,774,253
**GEAR DIFFERENTIAL**
Everett S. Minard, Glendale, and Frederick Lenzen, Whittier, Calif., assignors to Librascope, Incorporated, Glendale, Calif., a corporation of California
Application March 26, 1953, Serial No. 344,810
5 Claims. (Cl. 74—675)

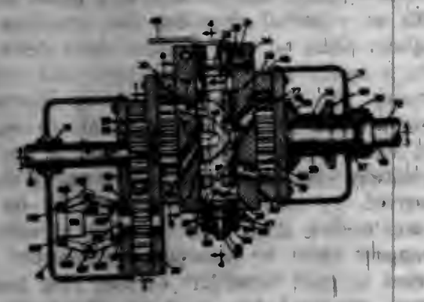


1. In a differential gear assembly of the character described, a hollow shaft having a resiliently deformable end portion provided with a plurality of symmetrically disposed slots, a differential gear assembly carried by said hollow shaft beyond the inner ends of said slots and comprising a pair of ring gears rotatably mounted on said hollow shaft, each of said ring gears being provided with an external shoulder for receiving a spur gear, a spider fixed to said hollow shaft between said ring gears, a spider gear meshing with said ring gears, clamp means for resiliently deforming inwardly the slotted end portion of said hollow shaft to secure the same to a support shaft passing through in any desired angular relation with respect to said support shaft, and means carried by said spider engageable by a tool whereby said hollow shaft may be adjusted with respect to said support shaft to facilitate engagement of spur gears carried by said shoulders of said ring gears with locked gears arranged for meshing relationship therewith.

---

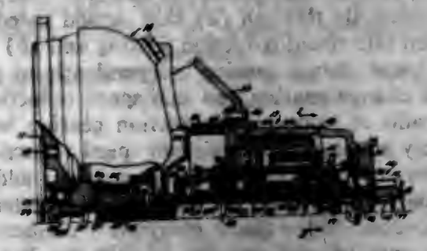
2,774,254
**AUTOMATIC CONSTANT SPEED DEVICE**
Walter J. Gerber, San Diego, Calif.
Application January 21, 1955, Serial No. 483,450
17 Claims. (Cl. 74—675)
(Granted under Title 35, U. S. Code (1952), sec. 266)

3. An automatic constant speed device which comprises a power input shaft, power differential means including at least one gear means rotatably fixed to said shaft, variable ratio transmission means having drive means and driven means, said drive means being rotatably fixed to said shaft, variable tooth gear means in engagement with said drive means and driven means,



said variable tooth gear comprising a substantially circular rigid body means, a plurality of gear tooth slats slidably disposed in said body means, means on certain of said slats for limiting sliding movement thereof, resilient means supported by said body means and engaging certain of said slats for biasing all of said slats in a tilted position such that each lateral face of said slat members is disposed at an acute angle with respect to a radius of said body means passing through said face, actuating means connected to said variable tooth gear means for

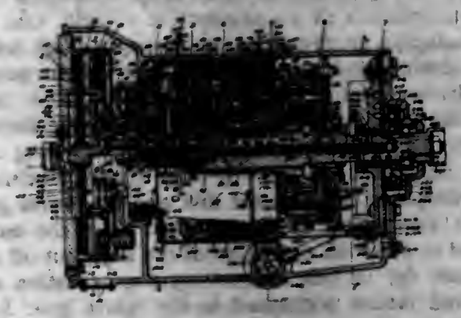
altering the position thereof relative to said drive means and said driven means, said driven means being connected to a portion of said power differential means, power output means connected to said power differential means, governor differential means having a member connected to a source of power producing a substantially constant speed, and means connecting the output of said governor differential means to said actuating means for controlling the ratio of said variable ratio transmission means.



---

**2,774,255**
**HYDRAULIC VARIABLE SPEED TRANSMISSION**
Frank A. Morris, Malvern, Ohio
Application January 11, 1954, Serial No. 403,094
14 Claims. (Cl. 74—687)

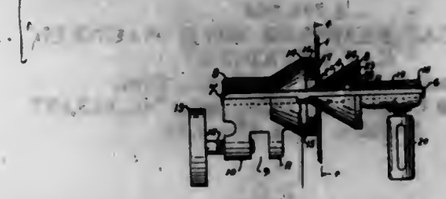
8. A hydraulic variable speed transmission including an oil pump, means for driving the pump, a pair of similar fluid motors, means connecting the pump to one of said motors for rotating said one motor, differential gear, means causing the other motor of said pair to counterrotate, means for throttling the incoming oil to that motor which may counterrotate, said last-named means including a variable orifice at the incoming side of said other motor and means providing communication between the pressure side of the pump and said variable orifice, and pressure oil means opposing rotation of the counterrotating motor and comprising means providing communication between the pressure side of the pump and the outgoing side of that motor which may counterrotate.



**2,774,256**
**AUTOMATIC OVERDRIVE AND TRANSMISSION SYSTEM**
Oscar H. Banker, Evanston, Ill., assignor to New Products Corporation, Chicago, Ill., a corporation of Delaware
Application September 8, 1951, Serial No. 245,721
16 Claims. (Cl. 74—740)

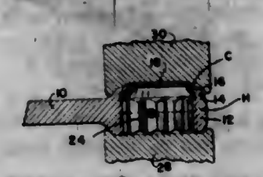
1. A transmission system comprising an engine driven coupling unit, a change speed unit and a manually controllable transmission unit drivingly connected to one another, an electrically energizable control unit operatively connected to said change speed unit to actuate the same for change speed action, and means controlling said control unit, including an engine driven governor, and an electrical circuit independent of the ignition circuit of said engine connected to said control unit and said governor and completed through the latter to energize the control unit, said circuit comprising a change speed unit energizing portion and a change speed unit holding portion, a switch in said energizing circuit portion operable to complete the same, a further switch in said holding circuit portion operable to complete and to overrule said holding portion notwithstanding uninterrupted ignition operation of said engine, and a manually actuable operating member common to and mechanically connected to said switches to control the latter in different positions of the member.

---



**2,774,257**
**MOTION CONVERTING AND TRANSMITTING APPARATUS**
Tracy Brooks Tyler, Miami Beach, Fla.
Substituted for application Serial No. 37,128, July 6, 1948.
This application July 7, 1950, Serial No. 172,599
46 Claims. (Cl. 74—752)

1. In a motion converting and transmitting device, in combination with driving and drivable elements, transmission means effectuable to establish a drive between said elements at relatively variable ratio including a primary drive ratio, automatic ratio changing means normally conditioned to effect the primary drive ratio and automatically variable to a different condition which defines a different ratio, means including automatic motivating and timing means to automatically vary the condition of said ratio changing means responsive to the elapse of a limited time interval, and means whereby said ratio changing means is operable to automatically select, initiate and effect the change from one drive ratio to the other responsive to the elapse of said limited time interval.

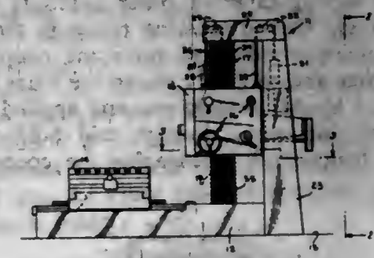


**2,774,258**
**HOLDER FOR DISC SAWS AND THE LIKE**
John B. Eagle, Los Angeles, Calif.
Application February 9, 1953, Serial No. 335,808
6 Claims. (Cl. 76—79)

2. Apparatus for rotating and holding a disc shaped saw blade during filing, grinding or setting of the teeth thereof, which comprises an elongated shaft, support means to support one end portion of said shaft, a clamping body having a generally conical recess, said clamping body encompassing said shaft at such a position that the axis of the wall of said recess is coaxial with said shaft, a cone element mounted on the other end portion of said shaft in sliding relationship, said cone element having an exterior conical surface coaxial with said shaft and adapted to enter said conical recess, said exterior conical surface being also adapted to enter a central opening in said saw blade and force said saw blade against stop means associated with said clamping body, means to lock said cone element at various longitudinal positions on said shaft, a first bearing race fixed in rotational position relative to said support means, a second bearing race adapted to rotate with said saw blade, and rolling elements mounted between said bearing races to permit substantially frictionless rotation of said saw blade relative to said support means.

---

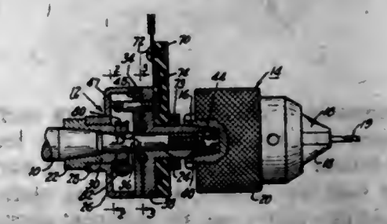
**2,774,259**
**METHOD OF MAKING BOX WRENCHES**
Frank T. Caulkins, Bryan, Ohio
Application July 11, 1955, Serial No. 521,235
3 Claims. (Cl. 76—114)



2. In a method for making box wrenches, the steps of forging a handle and a substantially cylindrical wrench head at one end thereof with a thick walled portion having a bore and a thin walled portion of greater internal diameter than said bore and less external diameter than said head, through-broaching said bore to other-than-round shape for engaging a nut or the like, and contracting the outer end of said thin walled portion by means of a forming die to form it into a perforated cap-like extension of said thick walled portion.

---

**2,774,260**
**HORIZONTAL BORING MACHINE WITH COLUMNAR GUIDES**
Willi Schraub, Wickrath (Niers), Germany, assignor to Scharmann & Co., G. m. b. H., a company with limited liabilities
Application February 16, 1954, Serial No. 410,477
Claims priority, application Germany February 25, 1953
4 Claims. (Cl. 77—3)

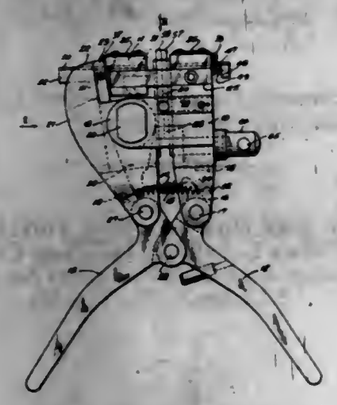


1. In a horizontal boring machine, having a bed and a spindle box vertically movable in opposite directions above said bed, in combination, two vertical columns supported on said bed guiding said spindle box vertically, an upright support adjacent said columns connected to said bed, a cross piece interconnecting the top of both columns and of the support to stabilize said columns,

and means connected to said cross piece and operable for raising and lowering said spindle box.

---

**2,774,261**
**CONTROL MECHANISM FOR DRILL PRESSES**
William E. Leibing, Pasadena, Calif.
Application April 20, 1956, Serial No. 579,536
3 Claims. (Cl. 77—55)



1. A torque switch for a drill press or the like having a spindle, comprising a shaft adapted to be operatively connected to the spindle and to rotate in unison therewith, a second shaft axially aligned with said first mentioned shaft and capable of rotating relative thereto for receiving a chuck, a disc-shaped member joined to said first mentioned shaft for rotation therewith and having an arcuate slot therein forming an abutment, a disc-shaped member joined to said second mentioned shaft for rotation therewith, a post seated in said second mentioned disc-shaped member and extending through said slot, a cup-shaped shell around said first mentioned shaft and joined thereto, a spring connected at one end to said post and at the other end to said shell for urging said post against said abutment, an electrical contact mounted on said first mentioned disc-shaped member and adapted to make electrical contact with said post when said shafts rotate relative to one another, an electrical non-conducting, nonrotating plate around said second mentioned shaft, an electrical conducting ring on said plate connected to a terminal on said plate and a means connecting said contact to said ring, and a means for adjusting the tension on said spring including a gear secured to said first mentioned shaft and a worm on said shell for rotating said shell relative to said first mentioned member, thereby to vary the amount of torque on the drill required to cause said second mentioned shaft to rotate relative to said first mentioned shaft.

---

**2,774,262**
**BUTT PRESSURE WELDING DEVICE**
Anthony Bagnold Sowter, Ickenham, England, assignor to The General Electric Company Limited, London, England, a British company
Application August 15, 1952, Serial No. 304,539
Claims priority, application Great Britain March 26, 1952
12 Claims. (Cl. 78—82)

3. Pressure welding apparatus for butt joining a pair of wires or the like of pressure weldable metal comprising a pair of holder members arranged for relative rectilinear movement and normally biased away from each other, welding pressure applying means for moving said members together, pairs of cooperating jaw plates associated with each holder member, each pair of jaw

plates being formed with a central bore having a diameter slightly less than the diameter of the wires to be joined and having tapering outer contours engaging a correspondingly shaped tapering recess in the associated holder member, whereby to force the cooperating jaw plates together and to firmly clamp the wires held in the bores thereof by the welding pressure applied to the butted ends of said wires through said holder members, means for temporarily disengaging the cooperating jaw

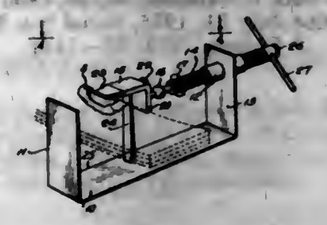
plates comprising a pin depending from each jaw plate and arranged to cam with a slot in the recess of the associated holder member, said slot being parallel to the contour of said jaw members, a sliding plate interposed between said jaw plates and the adjacent recess, said sliding plate having a pair of transverse slots each engaging one of said pins, and resilient means normally urging said sliding plate to a position to maintain said jaw plates in engaged position, and operating means for said sliding plate for temporarily disengaging said jaw plates.

---

2,774,263
ROLLING MILL
Axel Gustav Edvard Lenfven, Goteborg, Sweden, assignor to Aktiebolaget Svenska Kullagerfabriken, Goteborg, Sweden, a corporation of Sweden
Application August 7, 1952, Serial No. 303,045
Claims priority, application Sweden February 5, 1945
5 Claims. (Cl. 80—56)

1. A rolling mill comprising a pair of rolls and separate journal boxes therefor, a box for one roll being mounted on and being supported solely by the corresponding box for the other roll, preloadable bolt means for directly connecting the upper of the boxes with the lower box and constituting the sole means for positioning and supporting the upper box and for securing the upper box in position on the lower box in stressed position and thereby resisting the upward thrusts of the rolls tending to separate the boxes, and additional means operative while the boxes are in stressed condition for adjusting at least one of the rolls relative to its boxes to relatively adjust the rolls in both axial and radial directions.

---



2,774,264
BOTTLE CAP REMOVER WITH MAGNETIC CAP RETAINER
Stuart G. Bryant, San Pedro, Calif.
Application October 22, 1954, Serial No. 463,897
1 Claim. (Cl. 81—3.1)

A bottle opener comprising: a mounting plate, a flange on said plate, means in part on the flange and in part on said plate for removing a cap from a bottle, the part of said means that is on said flange comprising a bolt mounted on said flange, said bolt including a head having a dove-tail kerf therein and a permanent magnet provided with a dovetail slidably mounted in the kerf, said magnet having a portion which contacts the bottle cap while the cap is being removed from the bottle and which magnetically holds onto the cap after it is separated from the bottle.

---

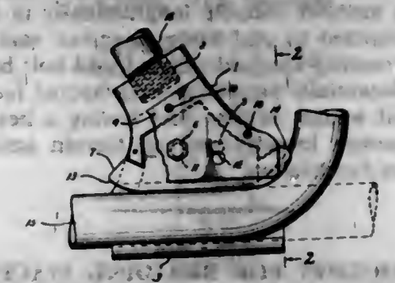
2,774,265
AUTOMOTIVE UNIT
Philip Feuer, Newark, N. J.
Application February 16, 1954, Serial No. 410,588
2 Claims. (Cl. 81—3.7)

1. An automotive device for separation of spring leaves comprising an elongated base member having a longitudinal edge, a flat guide member secured to and extending upwardly perpendicular to one end thereof and adapted to bear against and abut one of the side edges of the spring leaves to be separated, with the base member positioned below said leaves to be separated, a bearing on said base member, a bar member movably positioned in said bearing, complementary means on said bar member and bearing for controlled movement of said bar member toward and away from the guide member, a pointed separation finger, means to secure the finger to the end of said bar member for movement, on movement of the bar, intermediate the spring leaves to be separated, and arm means depending from the finger abutting a longitudinal edge of the base member to guide the finger for movement in a plane parallel to the axis of said longitudinal edge of the base member.

---

2,774,266
WATCH REPAIR TOOL
John C. Sheffield, Shreveport, La.
Application November 24, 1954, Serial No. 470,932
5 Claims. (Cl. 81—6)

1. A watchmaker's assembly tool comprising a base, a plunger mounted for vertical movement in said base, an adjusting rod mounted for horizontal movement in said base, the upper end of the plunger and the inner end of said adjusting rod being provided with aligning pins extending through a recess in the upper surface of said base



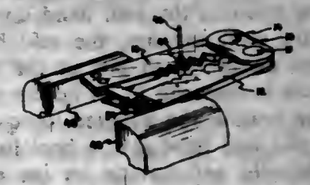
in spaced, parallel relationship, a pivoted lever member engaging a notched portion of the plunger for retracting the plunger pin, and a knob member threaded on the outer end of the adjusting rod for moving the adjusting rod pin toward and away from the plunger pin.

---

2,774,267
PIPE AND ROD BENDER
Charles B. Bostick, Houston, Tex.
Application March 14, 1955, Serial No. 494,004
5 Claims. (Cl. 81—15)

1. In a pipe bending tool, a shoe receiving member, one end of said member having an internally threaded handle receiving socket, and the other end of said member having pipe receiving means, a shoe adjustably mounted in said shoe receiving member between said socket and pipe receiving means and having a pair of transverse ports, a fulcrum pin selectively mounted in one of said ports and said shoe receiving member, said shoe having its extended end curved and a gradually deepening concave channel formed in the outer face of said shoe.

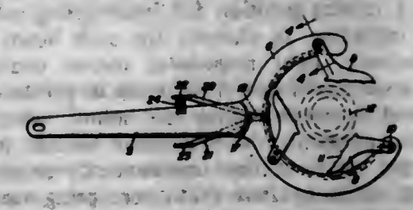
---



2,774,268
PLIER-LIKE TOOLS FOR USE WITH TOY RAILROAD TRACK
Abraham Kagan, East Orange, N. J., assignor to The Lionel Corporation, New York, N. Y., a corporation of New York
Application April 29, 1954, Serial No. 426,454
2 Claims. (Cl. 81—15)

1. A plier-like tool for use with a toy railroad track connecting pin having reduced diameter portions spaced from the ends thereof, and adapted to be inserted into the head of a sheet metal toy railroad track rail, said tool comprising crossed levers forming handles at one end and jaws at the other end, and wherein the jaws have clamping surfaces to hold the pin while it is being forced into the rail head, wherein the extreme outer end of the jaws have semicylindrical cut-outs parallel with the hinge axis for embracing the rail head, the jaws having opposite teeth projecting into the cut-outs and spaced from a side edge of the jaws an amount to enter one reduced diameter portion of a pin and gauge its insertion into the head, the opposed teeth also being positioned to crimp the rail head into the other reduced diameter portion to secure the pin in place.

---



2,774,269
CRIMPING TOOL
Henry W. Demler, Lebanon, and Martin L. Klingler, Hershey, Pa., assignors to Aircraft-Marine Products, Inc., Harrisburg, Pa.
Application March 2, 1955, Serial No. 491,682
5 Claims. (Cl. 81—15)

1. A crimping tool adapted to be operated by means of a pressing machine comprising a pair of levers of the second class having free ends adapted for insertion between compression-exerting elements of such pressing machine, means pivoting the levers together near their opposite ends, said free ends being swingable toward each other into a closed position and away from each other into an open position, said levers including closure-limiting means engaging each other along substantially the entire length of said levers when said levers are in their closed position to prevent further closure, opposed dies carried by said levers intermediate said pivot means and said free ends arranged to co-operate with each other as said levers are closed, and a pair of lateral guide members secured to one of said levers near its free end and adapted to overlap opposite sides of the other lever, said guide members having portions adapted to bear against opposite sides of said other lever when said levers are nearly in closed position.

---

2,774,270
PIPE WRENCH
Charles A. Daniel, Strykersville, N. Y.
Application March 7, 1955, Serial No. 492,378
3 Claims. (Cl. 81—53)

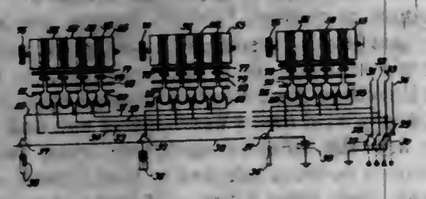
1. A wrench comprising a handle having a fixed crescent-shaped extension, a plurality of coacting jaws pivoted to the extension internally of the latter, an arcuate member positioned in side-by-side concentric relation with respect to the crescent-shaped extension and connecting the pivoted jaws to each other for simultaneously opening and closing movement, and manipulating means for the arcuate member, said manipulating means being supported by the handle and connected to the arcuate member for rotating the latter to effect an opening and closing movement of the pivoted jaws.

2,774,271

## LEVER-ACTUATED, SLIDABLE JAW WRENCH

Raphaël Lucien Mano, Paris, France, assignor to Société d'Etudes Mécaniques et d'Organisation Industrielle, Paris, France, a société anonyme of France

Application March 18, 1955, Serial No. 495,211
5 Claims. (Cl. 81—127)



1. An adjustable spanner having a fixed jaw, a shaft end rigidly secured to the said fixed jaw, a movable jaw slidably-mounted along the said shaft end, a control spring mounted on the said shaft end and adapted to urge the said movable jaw towards the said fixed jaw, an operating handle for the said spanner, the said handle being pivotally-mounted on the fixed jaw at the extremity of the said jaw which is opposite to its lip, an abutment on the said operating handle and adapted to co-operate with an abutment on the said fixed jaw, a heel formed on the said operating handle and having an incurved portion arranged opposite the rear part of the said movable jaw, the said incurved portion being hollowed-out in the form of a gutter so as to come into abutment by its base with the said movable jaw.

2,774,272

## PHOTOELECTRIC MUSICAL INSTRUMENT

Watson D. Harbaugh, Evanston, Ill.

Application November 23, 1951, Serial No. 257,731
14 Claims. (Cl. 84—1.18)

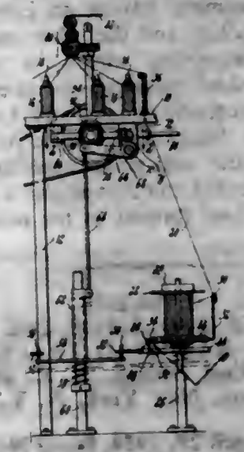
1. A system for producing a compound sound wave including a plurality of different complex sound waves of musical instruments comprising means for producing a plurality of light beams, each of said light beams varying in intensity in accordance with characteristics of a different musical instrument sound wave, means normally occupying a resting position for interrupting said beams selectively including an element for each beam of varying translucency, light responsive means energized by light beams selected by said elements to produce a compound sound wave including the sound waves of the light beams energizing the responsive means, means including finger actuated keys momentarily engaging said interrupting means to drive said interrupting means from their respective resting positions when moved in one direction for varying the positions of said elements to vary the magnitude of the intensity of the light beams energizing the responsive means to produce a compound sound wave of predetermined content, means for restoring said elements to beam interrupting positions at a predetermined speed to taper the compound sound proportionally throughout the range of its components including a continuously rotating member engaged by said interrupting means when driven from said resting positions and means controlled by said key for interrupting said engagement by said interrupting means when the key is moved in the opposite direction.

2,774,273

## ANCHOR BOLT HAVING WEDGE SHAPED EXPANDER MEMBER SECURED THERETO

Henry N. Olson, Milwaukee, Wis.

Application September 30, 1953, Serial No. 383,259
3 Claims. (Cl. 85—2.4)



1. In an anchor bolt, a bolt body member adapted for axial insertion into an opening in a support and having a lateral recess presenting a face tapered longitudinally of said member and further presenting a shoulder at the deeper end of said recess, said body member having formed longitudinally therein an aperture opening at said shoulder and provided with a restriction adjacent said shoulder, a wedge member cooperating with said tapered face and adapted for engagement with the walls of said opening for firmly securing the bolt in the opening, and a retaining member slidable longitudinally in said aperture and attached to said wedge member, said retaining member extending longitudinally of said bolt body member and substantially parallel to said tapered face and the path of said wedge member and having a head portion in said aperture loosely confined therein against withdrawal by said restriction.

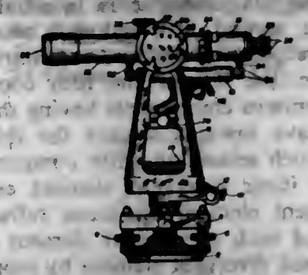
2,774,274

## STOP MOTION FOR BRAIDING MACHINES

Benjamin Hutnick, Malden, Mass.

Application June 12, 1953, Serial No. 361,171
2 Claims. (Cl. 87—18)

1. In a braiding machine having a main frame including an elevated circular platform, bobbin-carrying spindles in said platform a circular series of warp thread guides on said platform, a stand for a spool of warp thread under each said guide, and driving means for said spindles including a clutch and a lever operable to engage and disengage the clutch members; stop mechanism comprising a rod slidably mounted on said frame and attached to said lever, spring means on said rod biased to rock said lever to disengage the clutch, said rod having a notch in a side thereof, a bell-crank rockably mounted on said frame with an upright arm normally engaging in said notch to hold said rod against clutch opening movement, said bell-crank also having a horizontal arm, a link pivotally attached to said horizontal arm and extending downward therefrom, a vertically slidable member attached to the lower end of said link, spring means supporting the weight of said slidable member and link to maintain said bell-crank arm engaged in said notch,



a vertically slidable element carried by each said stand under the spool thereon, each said element having a portion overlapping a portion of said vertically slidable member, a rockable hook depending from each said stand and normally engaging the slidable element thereunder to hold said element against downward movement, spring means on each said stand pressing the corresponding slidable element thereon downward, and an elongated trigger operatively connected to said hook and normally engaged by a warp thread from the spool to hold said hook in engagement with said slidable element, the parts being so arranged that when the trigger is released from the warp thread, the trigger rocks to disengage the hook, releasing the slidable element which depresses the slidable member, rocking the bell-crank clear of the notch so that the spring means on the rod disengages the clutch members and stops the machine.

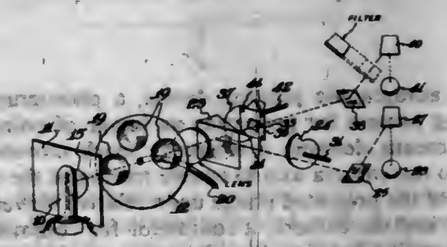
2,774,275

## OPTICAL INSTRUMENT

William G. Keller, Summit, N. J., assignor to Kouffel & Esser Company, Hoboken, N. J., a corporation of New Jersey

Application May 1, 1952, Serial No. 285,510
1 Claim. (Cl. 88—2.2)

An instrument for locating points in a plane perpendicular to an optical line of sight comprising a telescope, an axle carrying said telescope, means for adjusting the line of sight of said telescope perpendicular to the axis of said axle, bearings supporting said axle for rotation about its axis, an adjustable standard supporting said bearings, an element having a plane reflecting surface mounted on said axle so that the plane of the reflecting surface is perpendicular to the axis of the axle and thereby parallel to the plane generated by the line of sight of the telescope as the telescope is rotated on its axle, mounting means for the element having a plane reflecting surface for positioning the plane reflecting surface of said element perpendicular to the axis of said axle, the perpendicularity of the plane reflecting surface to the axis of the axle being determinable by rotating the axle while observing through another optical instrument an image reflected from said plane reflecting surface so that any necessary adjustment to secure perpendicularity can be made, whereby points may be located in a plane perpendicular to the optical line of sight of another optical instrument by adjusting said standard to make the axis of said axle parallel to the optical line of sight of the optical instrument as determined by an image on the line of sight of the optical instrument being reflected from said plane reflecting surface backward into the optical instrument and sighting through said telescope carried on said axle while said instrument is so adjusted.



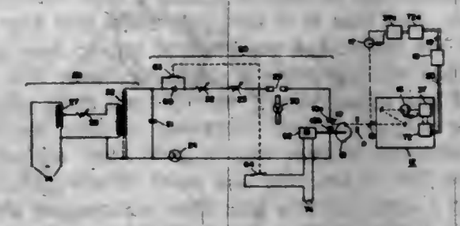
2,774,276

## COLORIMETER

Leo G. Glasser and Daniel J. Troy, Jr., Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

Application August 28, 1951, Serial No. 243,936
7 Claims. (Cl. 88—14)

1. A colorimeter comprising a light source and in optical alignment therewith a light filter, a convergent lens producing a real image of said light source and a semi-transparent mirror directing the light from said convergent lens along two distinct paths, the first of said two paths being provided with a light regulator having an adjustable control means and a color sample support disposed past said light regulator, the second of said paths being provided with a linear light transmitting mask-light regulator assembly having an adjustment means calibrated so as to permit determination of color values and a reference color support disposed past said mask-light regulator assembly, said convergent lens, said semi-transparent mirror, said light regulator and said mask-light regulator assembly being all disposed in close



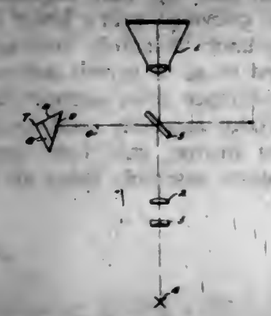
proximity one to another, a pair of vacuum phototubes, on viewing the sample and the other the reference disposed out of the line of sample and reference specular reflection with respect to said color sample support and said reference color support, connected in a light ratio-responsive series-aiding electrical bridge circuit provided with a direct current voltage source, an electrometer tube having a grid element in electrical connection with said bridge circuit between said phototubes and an associated plate element in circuit with a direct current power source, and an indicating meter in electrical connection with the output side of said electrometer tube adapted to sense the electrical unbalance between said phototubes.

2,774,277

## SYSTEMS FOR SPECTROCHEMICAL ANALYSIS

Raymond C. Machler, Philadelphia, Pa., assignor to Leeds and Northrup Company, Philadelphia, Pa., a corporation of Pennsylvania

Application November 5, 1952, Serial No. 318,807
9 Claims. (Cl. 88—14)



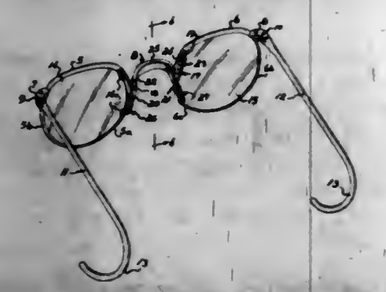
1. In combination, a spectrometer system having a source of radiant energy operable over a range of selected repetition rates and a phototube responsive to a selected band of the spectrum of said radiant energy for producing radiant-energy pulses at a selected repetition rate, an amplifier having an input circuit including said phototube and an output circuit in which there appears an output signal including amplified pulses corresponding with those applied to said input circuit, a synchronous rectifier in said output circuit, means for applying to said input circuit radiant-energy pulses during alternate half cycles only of an alternating-current reference voltage to insure unipolarity of the rectified amplified pulses throughout said range of selected repetition rates, and means including said reference voltage for operating said synchronous rectifier to produce switching operations at a predetermined time in the cycle of said reference voltage.

2,774,278

## AUTOGRAPH PHOTOGRAMMETRIC PLOTTING DEVICES BASED ON THE DEVILLE PRINCIPLE

Umberto Nistri, Rome, Italy

Application June 2, 1953, Serial No. 359,177
1 Claim. (Cl. 88—24)



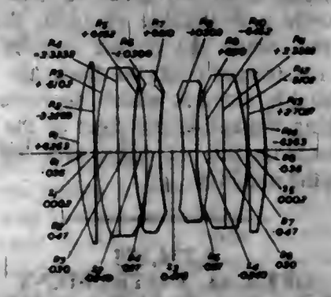
In an autographic plotting device, a photogrammetric projecting camera for projecting an image of points to be plotted, means defining a reference mark movable with respect to the camera axis to enable tracing of the contour features of the projected image upon relative movement of the mark and the camera, a collimator for collimating the rays proceeding from said mark, a plane semi-transparent reflector mounted between said camera and the reference mark and oriented so as to reflect a part of the rays from the camera and a part of the rays from the mark in opposite directions along substantially a common axis, and a trihedral reflector prism disposed on said common axis for reflecting said part of the rays from the mark back along said common axis to merge for observation with the part of the camera rays reflected by said reflector; the entry face of said trihedral prism being tilted with respect to said common axis through an angle at least equal to half the angle of the semi-field of the observing system, whereby fused images of the camera rays and of the mark are visible along said common axis free from secondary reflections.

2,774,279

## SPECTACLES FOR ATHLETIC COMPETITORS

Marshall S. Olson and Richard C. Lindmark, Minneapolis, Minn., assignors to N. P. Benson Optical Company, Inc., Minneapolis, Minn., a corporation of Minnesota

Application February 9, 1953, Serial No. 335,664
6 Claims. (Cl. 88—43)



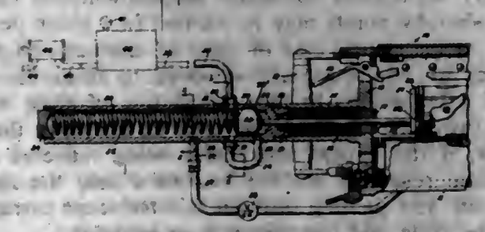
1. An ophthalmic assembly including in combination an eye wire having a nasal and a temporal side, a lens mounted within said eye wire and having a nasal side with a recess formed in the peripheral portions thereof, a bridge member rigidly connected with said eye wire and supporting the same, and a soft, resilient and tough arch encasing said bridge member and having portions thereof extending through the recess of said lens and encircling the nasal side of said eye wire to preclude rotation of said lens and more firmly affix said arch to said bridge member and said eye wire, said arch being shaped to conform to the bridge of a nose of a human and functioning to protect the wearer from said eye wire and said bridge member in the event of a sharp concussion received thereagainst and to simultaneously protect said eye wire from deformation and consequent ejection of its lens.

2,774,280

## OPTICAL OBJECTIVES COMPRISING SIX AIR SPACED COMPONENTS IN AXIAL ALIGNMENT

Gordon Henry Cook, Leicester, England, assignor to Taylor, Taylor & Hobson Limited, Leicester, England, a British company

Application May 11, 1953, Serial No. 354,270
Claims priority, application Great Britain May 14, 1952
12 Claims. (Cl. 88—57)



1. An optical objective for photographic and other purposes corrected (at least for a substantial portion of the visible spectrum) for spherical and chromatic aberrations, coma, astigmatism, field curvature and distortion, and comprising six components in axial alignment of which the first, second, fifth and sixth counting from the front are convergent and the third and fourth are divergent and biconcave, the second and fifth components being compound meniscus components having their air-exposed surfaces concave inwards toward the third and fourth components, such second and fifth components each consisting of an inner divergent element cemented to an outer convergent element the mean refractive index of the material of such convergent element exceeding that of the associated divergent element by more than .05, the arithmetic mean of the equivalent focal lengths of the first and sixth components lying between 1.8L and 2.7L, that of the second and fifth components between 3L and 10L, and that of the third and fourth components between —2.2L and —1.5L, where L is the overall axial length of the objective from the front surface of the first component to the rear surface of the sixth component and wherein the said overall axial length (L) is substantially 0.373 times the equivalent focal length (F) of the whole objective.

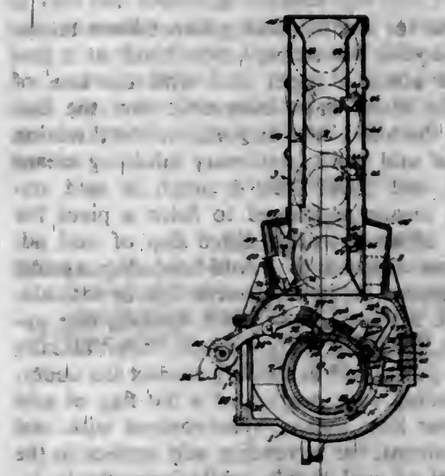
2,774,281

## INJECTOR PUMP FOR BREECH COOLING OF GUNS

George A. Hawkins, West Lafayette, Ind., assignor to Purdue University, Lafayette, Ind.

Application September 19, 1945, Serial No. 617,374
2 Claims. (Cl. 89—1)

1. In an injector pump for cooling a gun having a receiver body, a barrel, a reciprocating bolt and a bolt buffer assembly, comprising, a pump cylinder, closed at its rearward end and provided with a reduced, axially bored, threaded forward head portion, said cylinder adapted to be threadably secured in coaxial relation to the rearward end of said bolt buffer assembly, a piston rod connected at its forward end to said reciprocating bolt and extending axially and rearwardly through said bolt buffer assembly, said axial bore in head portion on said pump cylinder and into the forward portion of said pump cylinder, a piston secured on the rearward end of said piston rod and slidable in said pump cylinder, a spring in said pump cylinder normally biasing said piston in a forward direction, an annular channel surrounding said pump cylinder, a first pipe connecting said annular channel with a source of liquid coolant, a series of radial ports in said cylinder wall communicating between said annular channel and said pump cylinder, a second pipe communicating between said annular channel and the forward portion of said pump cylinder immediately forward of said piston when said piston is at its full forward position in said pump cylinder, a third pipe communicating between said pump cylinder at a point substantially rearward of said piston, when said piston is in said full forward position, and a barrel on said gun, said piston acting upon recoil to move in a rearward direction to force said liquid coolant into said barrel of said gun and a pressure regulating valve on said third pipe.

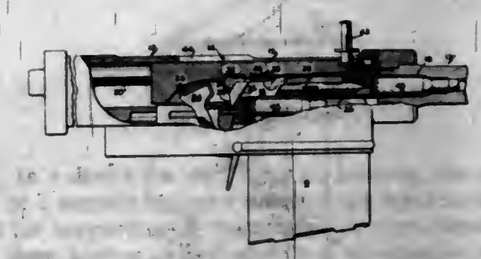


2,774,282

## REPEATING ROCKET LAUNCHER

Andrew Ballash, Los Angeles, Stephen A. Stam, Glendale, and Paul E. Anderson, Torrance, Calif., assignors to the United States of America as represented by the Secretary of the Army

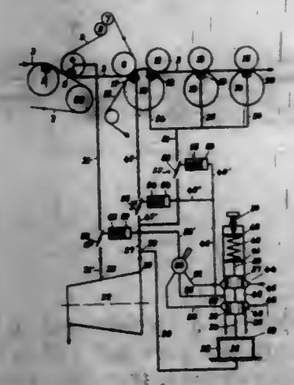
Application February 8, 1951, Serial No. 210,026
21 Claims. (Cl. 89—1.7)



7. In a repeater rocket launcher, a main body, forward and rear open aligned bearings carried by said body, a launching tube assembly including a semi-cylindrical tube portion having coaxial bearing sleeves at its ends, each sleeve being journaled in a respective one of said bearings, said assembly also including first and second quarter-cylindrical doors, each hinged along one edge to a respective edge of said tube portion, said doors being pivotable from a first closed position forming with said tube portion a complete launching tube, to a second open position in which a rocket may be loaded laterally into said tube portion, said doors having flanges along their free edges which meet when in first position, a clamp member hinged to said second door and pivotable from an open position free of said flanges to a clamping position holding said flanges in gas-tight relation, cam means carried by said main body, follower means carried by said doors and clamp member, all said follower means engaging said cam means and effective, in response to rotation of said launching tube assembly as a unit in said bearings, to move said doors and clamp member from open positions when said tube portion is in upwardly-facing position, to closed and clamping positions, respectively, when said assembly has been rotated through a predetermined angle, and means carried by said main body to rotate said assembly.

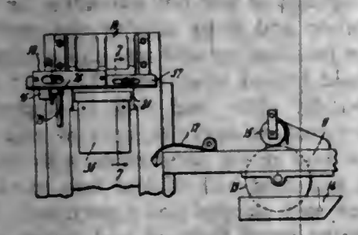
2,774,283

## BREECH MECHANISM FOR A FIREARM



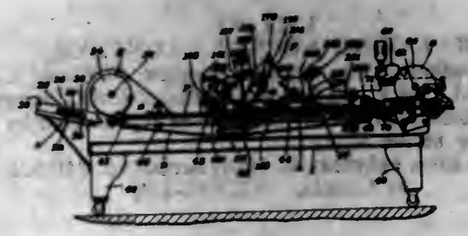
Earle M. Harvey, Agawam, Mass., assignor to the United States of America as represented by the Secretary of the Army

Application June 14, 1954, Serial No. 436,749
1 Claim. (Cl. 89—194)
(Granted under Title 35, U. S. Code (1952), sec. 266)



In a firearm having a receiver and a barrel with a chamber for a cartridge provided with a projectile and a case rearwardly projectable from the chamber when the cartridge is fired, a carrier slidably mounted in the receiver for reciprocation between a battery and a recoil position, said carrier being provided with a longitudinal recess in the underside of the front portion thereof and oppositely disposed holes extending laterally from said recess adjacent the front end thereof, a guide rotatably mounted in each one of said holes and having a tongue portion on the inner end thereof, a bolt received by said recess for longitudinal movement therein, longitudinal recessed guideways in opposite sides of said bolt and adjacent the front portion thereof for slidably receiving said tongue portions to slidably support the front end of said bolt and to mount said bolt for pivotal movement of the rear end thereof between a downward locked position and an upward unlocked position, a head portion in said bolt for rearwardly abutting the base of the case to transfer the recoil force of the case to said bolt for rearward movement thereof, means for transferring the rearward movement of said bolt simultaneously to said carrier for acceleration thereof from said battery position to said recoil position, a heel portion extending downwardly from the rear end of said bolt, a rear portion on said heel portion engageable with a lock abutment in the receiver for stopping said bolt when said bolt is in said lock position and when said carrier is energized sufficiently for movement to said recoil position, a transverse rib extending downwardly from the top side of said recess and having an underside and an upwardly and forwardly sloping surface on the front side, a cam portion extending upwardly and forwardly from said rear end of said bolt for engageable cooperation with said sloping surface to cam said rear end of said bolt downwardly to said lock position for engagement of said rear end portion on said heel portion with said locked abutment, a stepped-down portion on the top side of said bolt extending forwardly from said cam portion and being slidably engageable with said underside for maintaining said rear end portion in engagement with said locked abutment while said carrier continues rearwardly after said bolt is stopped, inclining shoulders disposed on opposite sides of said bolt, inclining ledges in said recess cooperable with said shoulders for pivoting said rear end of said bolt to said unlocked position when said stepped-down portion is free of said underside during recoil flight of said carrier for engaging said bolt to said carrier for rearward movement therewith after the projectile has left the barrel and for supporting said rear end of said bolt in said unlocked position during movement of said bolt and said carrier together to said recoil position and resilient means for returning said carrier to said battery position.

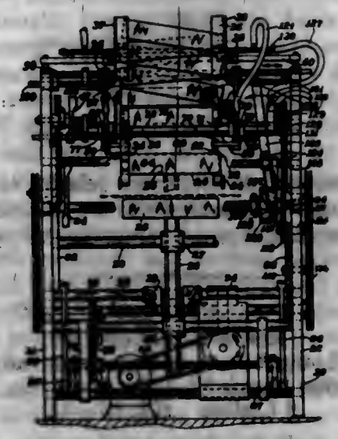
**2,774,284**
**MACHINE FOR MAKING LENGTHS OF PAPER OR CELLULOSE**
Kurt Feer, Winterthur, Switzerland, assignor to Sulzer Freres, Societe Anonyme, Winterthur, Switzerland, a corporation of Switzerland
Application March 21, 1955, Serial No. 495,612
Claims priority, application Switzerland March 23, 1954
5 Claims. (Cl. 92—44)



1. A paper making machine comprising a wire at the wet end of the machine, a felt ribbon for taking over the paper mat from the wire, a roll over which said felt ribbon is laid, a suction box placed inside of said roll for normally drawing the paper mat from said wire to said felt ribbon, a plurality of rolls guiding the moving paper mat after it has been taken over by said felt ribbon, vacuum boxes individually connected with said last mentioned rolls for removing moisture from the paper mat, a turbocompressor, a conduit connecting said turbocompressor with said suction box and conduit means connecting said turbocompressor with said vacuum boxes for producing a vacuum in said boxes, a control mechanism responsive to the pressure in at least one of said vacuum boxes, a valve in the conduit connecting said turbocompressor with said suction box, and a manually operable device including means for selectively manually operating said valve and for connecting said control mechanism with said valve when said valve is not manually operated for automatic actuation of said valve by said control mechanism according to the pressure in at least one of said vacuum boxes.

**2,774,285**
**AUTOMATIC ACTUATING MEANS FOR BOX SETTING-UP MACHINES**
Clarence Lloyd Claff and Carl A. Moeller, Randolph, Mass., assignors, by mesne assignments, to M. B. Claff & Sons, Inc., Randolph, Mass., a corporation of Massachusetts
Original application February 26, 1947, Serial No. 731,064, now Patent No. 2,658,433. Divided and this application November 26, 1952, Serial No. 322,752
6 Claims. (Cl. 93—36.3)

1. In a box setting-up machine, the combination with blank gluing and folding mechanism, of a pair of pressure members movable relatively toward and from one another, power means for causing such movement, devices for rendering said power means operative, a contact member positioned to be engaged by the blank to actuate said devices while the blank is being held and advanced to the pressure members, a wiper plate upon one of the pressure members having a slot extending in the direction of the path of advance of the blank through which slot the contact member extends, and means for adjustably mounting the contact member upon the rear face of the wiper plate to permit the contact member to be positioned nearer to or further from the pressure members to vary the time of rendering the power means operative with respect to the movement of the blank.



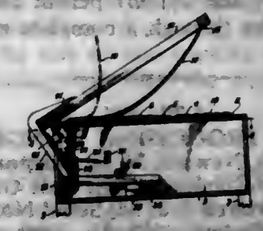
**2,774,286**
**MACHINE AND METHOD FOR FOLDING BOX BLANKS**
Leon E. La Bombard, Nashua, N. H., assignor to International Paper Box Machine Company, Nashua, N. H., a corporation of New Hampshire
Application March 18, 1952, Serial No. 277,242
10 Claims. (Cl. 93—49)

1. In a machine for use in making knockdown boxes; means for continuously advancing a box blank at a predetermined speed along a paper line with the line of articulation of the blank flaps transverse, and the line of articulation of the blank tabs diagonal, to the direction of advancement of said blank; stationary infolding means positioned above said paper line; a notch in said stationary infolding means positioned to form a pivot for the leading edge of an upwardly lifted flap of said advancing blank and adapted to infold said flap against the main body thereof on its transverse line of articulation as said blank advances thereunder; leading flap uplifting mechanism, including a rigid, plane, longitudinally extending surface positioned to slidably contact the undersurface of the leading edge portion of a flat flap of said blank, at the paper line; means, synchronized with said blank advancing means, for advancing said surface in the direction of travel of said blanks while increasingly inclining said surface, thereby guiding the leading edge of each successive leading flap upwardly above the paper line into engagement in the notch of said stationary infolding means; and a stationary longitudinally extending folder bar positioned above the path of a triangular tab, adjacent said infolding means and uplifting mechanism, said folder bar being arranged to fold said tab in the opposite direction to that of said infolded leading flap.

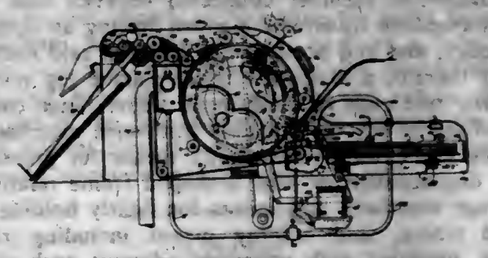
**2,774,287**
**SUCTION STRIPPING AND STACKING APPARATUS**
Harold J. Goss, Nashua, N. H., assignor to The International Paper Box Machine Company, Nashua, N. H., a corporation of New Hampshire
Application March 31, 1955, Serial No. 498,261
12 Claims. (Cl. 93—51)

1. In a machine for making boxes said machine having a box forming channel with an exit end, box forming means reciprocable in said forming channel and a box receiving channel with an entrance end, said channels being coaxial and facing each other with said ends spaced apart, suction gripper means facing toward said box forming channel and adapted to secure a grip on a box positioned bottom foremost at the exit end thereof, means for moving said suction gripper means up to said entrance end along a predetermined path located in the space between said ends and moving said suction gripper means back to said exit end along a predetermined path at least partly located beyond the space between said ends, said moving means being cooperable with said box forming means to remove each successive box therefrom and advance the box bottom foremost into the entrance end of the box receiving channel; suction means

operably connected to said gripper means, including mechanism for releasing suction in said suction gripper means to disengage a box therefrom at the entrance end of said box receiving channel and box pusher means on, and movable with, said suction gripper means, said pusher means facing toward said box receiving channel and being adapted to push further into said channel, each successive box released at the entrance end thereof on the previous path circuit of said suction gripper means.



**2,774,288**
**LENS STANDARD**
Nikolaus Karpf, Munich, Germany, assignor to Valentin Linhof, Munich, Germany, a German company
Application April 11, 1952, Serial No. 281,817
Claims priority, application Germany April 13, 1951
1 Claim. (Cl. 95—50)



Adjustment means for a lens standard of a camera having a carriage; comprising a socket mounted centrally of said carriage, a knob provided with a peripheral groove and rotatably engaging said socket, interengaging means on said knob and said socket to move said knob axially upon rotation of said knob, said socket being provided with a slot extending in the direction of axial movement of said knob, and a member including a hinge connection to said standard and extending from the latter through said slot into said groove, said hinge connection being located below said lens standard and forming the tilting axis thereof, whereby rotative movement of said knob is translated into tilting movement of said standard about said tilting axis, said slot being defined by an inclined wall forming a stop against which said member abuts in predetermined position of said knob groove relative to said socket, said member and said stop when engaged with each other ensuring retention of said knob in said socket, and resilient means coacting with said carriage and said member to bias said member in one direction.

**2,774,289**
**PRINTING DEVICE**
Carroll B. Collins, Pittsburgh, Pa., assignor to Peerless Photo Products, Inc., Shoreham, N. Y., a corporation of New York
Application January 9, 1952, Serial No. 265,556
5 Claims. (Cl. 95—76)

1. In a device for photographic printing, the combination of a support having a substantially horizontal surface area for supporting the material to be reproduced, a flexible sheet having an operative area coextensive with said surface area and having its rear portion connected to the rear portion of said surface area, a frame member having connected to its front portion the front portion of the sheet, means pivotally connecting the rear portion of said frame member to the support on an axis located behind the rear end of said surface area and substantially below the level of said surface area whereby when the frame member moves from a vertical position to a horizontal position a sagging portion of the sheet will move progressively into contact with substantially the whole area of said surface until the frame member reaches fully closed position on said surface area.

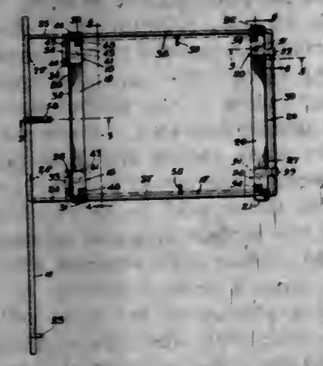
**2,774,290**
**AUTOMATIC COPYING MACHINES**
Jackson F. Mormann, Audubon, N. J.
Application April 10, 1952, Serial No. 281,617
3 Claims. (Cl. 95—77.5)

1. In an automatic duplicating machine for making prints from translucent originals, comprising an automatic feed mechanism, a revolving cylinder, manual control means and a driving mechanism; said cylinder having a transparent closure in the peripheral surface thereof; clamping means pivotally mounted on the peripheral surface of said cylinder and positioned adjacent the leading edge of said transparent closure, said clamping means having extending fingers to receive and grip the leading edge of said translucent original; said manual control means being operatively and selectively connectible to said cylinder, said driving mechanism and said clamping means; said manual control means having a first, second and third position, said manual control means manually moved to said first position to connect said driving mechanism to said revolving cylinder, said manual control means disconnecting said driving mechanism from said revolving cylinder when said manual control means is moved to said third and said second position; means operatively connected to said control means to move said manual control means to said second position following a complete revolution of said revolving cylinder, said manual control means operatively connected to said clamping means only when said control means is in said third position to thereby render said

**2,774,291**
**MACHINE FOR MAKING CORRUGATED PAPER BOARD**
Ernest Wilson Sykes, Bromley, England, assignor to Bryant & May Limited, London, England, a British company
Application March 31, 1953, Serial No. 345,966
Claims priority, application Great Britain April 4, 1952
3 Claims. (Cl. 93—53)

1. In a machine for making corrugated paper board, the combination of a pair of corrugating rolls, a pair of feed rolls for feeding a web of paper to said corrugating rolls, a pair of pressure rolls for feeding a web of paper to said corrugating rolls, a pair of pressure rolls for feeding a web of paper to said corrugating rolls in contact with the corrugated face of the web of paper passing between

clamping means ineffective to grip the leading edge of said translucent original; said machine having automatic duplicating operation from a single translucent original when said manual operating means is maintained in said first position; speed adjusting means operatively connected to said driving means to regulate the speed of said driving means and thereby permit continuous rotation of said cylinder through a complete cycle and from cycle to cycle.



---

**2,774,291**

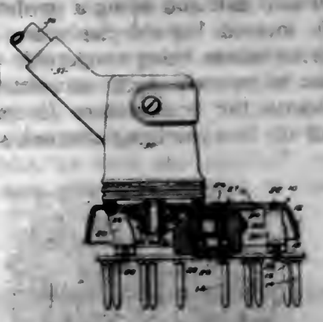
## FILM PROCESSING HANGER

Michael Domenech, Newark, N. J., assignor of twenty-five percent to Samuel Jules Lustig, East Orange, N. J.

Application March 5, 1954, Serial No. 414,313
5 Claims. (Cl. 95—100)

1. A film processing hanger comprising a main frame having a channel section hanger member, two laterally spaced parallel rod members secured to said hanger member and depending downwardly therefrom, a lower transverse member connected between the lower ends of said rod members, said lower transverse member having an upturned lower edge and turned up flexible ends secured to the outer side of said rods, and an intermediate transverse member connected between said rods, said intermediate transverse member having an upturned upper edge, and end portions rolled about said rods and secured thereto, a U-shaped frame having leg portions with their free ends inwardly bent, sleeve hinge connections affixed to the intermediate transverse member and receiving said inwardly bent ends, means for preventing lateral displacement of said U-shaped frame relative to said hinge members, and means for tightly holding film in said frame, said holding means including raised mounds, provided with openings, adjacent each corner of the main frame and pin members at each corner of the U-shaped frame adapted to enter the openings in said raised mounds.

---



**2,774,292**

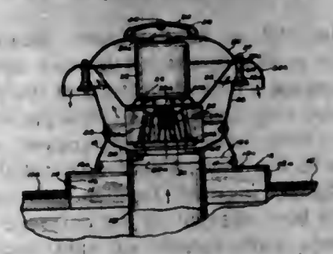
## EARTH CONDITIONING DEVICE

Eric Hartmann, Syracuse, N. Y., assignor to The Porter-Cable Machine Company, Syracuse, N. Y., a corporation of New York

Application April 28, 1954, Serial No. 426,212
7 Claims. (Cl. 97—43)

1. A manually supported and manipulable power operated earth conditioning device comprising a body including a motor housing, and an upwardly extending handle for manipulating the device, a motor mounted in said housing, a frame mounted on the under side of the body, frame supporting means carried by the body for suspending said frame for horizontal movement relative to the body, a plurality of vertically disposed earth engaging prong members fixedly mounted on said frame, said prong members depending from said frame in a non-linear group pattern distributed over an area of substantial lateral and longitudinal extent, some of said prongs being at the perimeter of said area and some of said prongs being in the mid-portion of said area, motion transmitting means journalled in the body and being operatively connected to said motor and said frame, said motion transmitting means

effecting movement of the frame relative to the body in a positively controlled orbital path of predetermined magnitude in a horizontal plane perpendicular to said prongs.



---

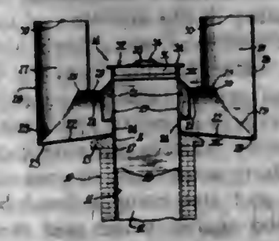
**2,774,293**

## ROOF EXHAUSTER

Louis J. Jonas, Indianapolis, Ind.

Application March 27, 1953, Serial No. 345,030
8 Claims. (Cl. 98—43)

1. In a roof exhauster adapted to be supported by the roof of a building or a curb extending upwardly from said roof having in combination, an annular member extending upwardly and outwardly, a conduit connected to the lower end of said annular member and extending downwardly into said building means for supporting said annular member from said roof or curb, a second annular member extending upwardly and outwardly from said first mentioned annular member and supported thereby, a third annular member spaced from said second annular member supported therefrom, extending downwardly therein and forming therewith an upwardly extending passage for air from said conduit said third annular member having a bottom with an opening therein, a motor supported on said bottom and closing the same, said motor having a depending driveshaft and a fan disposed above said conduit and secured to said shaft for forcing air upwardly through said passage.



---

**2,774,294**

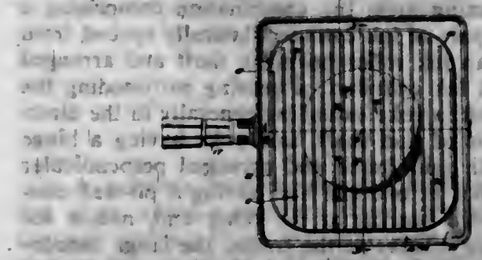
## RAIN COVER FOR CHIMNEYS

Max O. K. Kahle, Chicago, Ill.

Application October 6, 1954, Serial No. 460,556
4 Claims. (Cl. 98—76)

1. A rain cover for a chimney comprising means providing a first duct disposed on a vertical axis and having side walls adapted to be inserted into a chimney opening, said side walls having a pair of oppositely disposed openings formed therein, each opening having in register

therewith means providing a second duct disposed on a generally horizontal axis and having side walls integrated with said side walls of said first duct, the bottom portion of said side walls of each said second duct depending downwardly to prescribe an acute angle with the subjacent side walls of said first duct and forming an angularly inclined bottom drain directed outwardly away from said first duct, each said bottom portion having a drain aperture formed therein at the lowermost extremity thereof to gravitationally release all liquid fluids from said second duct, each said second duct terminating at its outer end in means providing a third duct disposed on a vertical axis substantially laterally displaced from said vertical axis of said first duct and having side walls integrated with said side walls of said second duct, each said third duct having a top opening forming an outlet for the chimney, means forming a baffle between said third duct and the upper portion of said second duct, an upright baffle adjacent said bottom portion of each said second duct between said first duct and said second duct and extending across the lowermost portion of said second duct to prevent liquid fluids from passing through said second duct into said first duct, said side walls of each said second duct being angularly offset to taper outwardly in diverging relation at the area of integration with said side walls of said first duct, thereby to increase the open cross-sectional area between said second ducts and said first duct in compensation for the cross-sectional area closed by each said baffle, the total cross-sectional area of both said second ducts and of both said third ducts being in excess of the open cross-sectional area of said first duct, said first duct having a top opening formed therein above the level of intersection of said second ducts with said first duct, and a removable cover seated in and closing said top opening, whereby flue gases from the chimney will pass through said first duct outwardly through said second ducts and said third ducts.



---

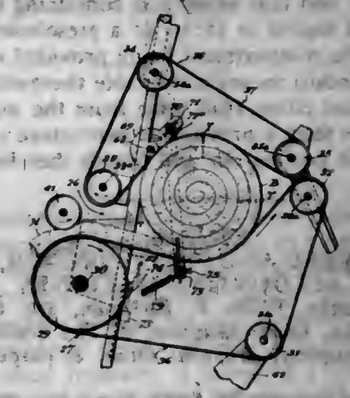
**2,774,295**

## RIBBED GRILL

William B. Watkins, Evanston, Ill., assignor to The Wm. B. Watkins Co., a corporation of Illinois

Application December 13, 1952, Serial No. 325,853
1 Claim. (Cl. 99—425)

A cooking utensil, comprising an upstanding outer peripheral wall joined to an inwardly extending base wall and an elevated, generally rectangular, food receiving cooking member having a depending peripheral wall joined integrally to said base wall to define a peripheral grease receiving cavity, said cooking member having a level peripheral area portion of uniform thickness and a generally circular central portion within said peripheral area of progressively greater thickness providing an upper surface sloping downwardly from generally the center of the utensil to said level peripheral area portion, said level peripheral area portion being of varying width around the central portion and both of said portions having a width to receive and hold food to be cooked, a plurality of generally parallel spaced ribs extending across the food receiving cooking member in raised relation to said upper surface, some of said ribs extending across the portion of uniform thickness without intersecting the central portion having the downwardly sloping surface, said ribs being arranged for supporting food to be cooked at least partially above said upper surface, said sloping and level surface portions between the ribs providing for drainage of food exuded liquids to said cavity, said sloping surface portions between the ribs having varying downward gradients whereby said drainage occurs at relatively different rates and provides areas on the cooking surface for selective rates and conditions of cooking, and a substantially flat surface on the side of said cooking member opposite said ribs for cooking food when the utensil is inverted.



---

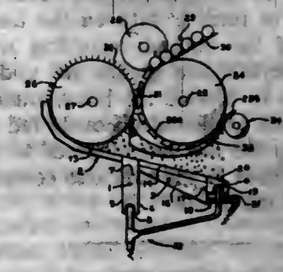
**2,774,296**

## TWINELESS STITCHER FOR ROTARY BALER

Werner W. Martinmaas, Jr., Miller, S. Dak., assignor to Inland Incorporated, a corporation of South Dakota

Application December 30, 1953, Serial No. 401,104
13 Claims. (Cl. 100—5)

1. A twineless stitcher for a rotary hay baler, comprising, in combination: long, reciprocable needle means adapted to move in and out of a rolled bale of hay to puncture several layers of the bale to form a hole along a line which extends generally along a chord through the bale and to tuck strands of hay from the outer layers of the bale into layers therebeneath to from a bale-tying stitch in said hole; and mechanism for simultaneously moving said bale and reciprocating said needle means in and out of the bale along a chord through the bale to form several stitches which are spaced both longitudinally and circumferentially about the bale.



---

**2,774,297**

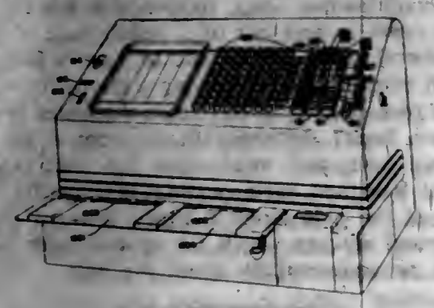
## OIL SEPARATING, CITRUS JUICE RECEIVING PAN ADAPTED FOR COOPERATION WITH A CITRUS JUICE EXTRACTOR

Charles Hall, Los Angeles, Calif.

Application October 3, 1950, Serial No. 188,154
2 Claims. (Cl. 100—105)

1. An extracted juice receiving pan for receiving juices from three separate portions of a juice expressing machine comprising: a three division, three compartment receiving pan means cooperable with the citrus fruit juice expressing machine in receiving position below the juice expressing region of the citrus fruit juice expressing machine, said receiving pan means including a front compartment, a middle compartment and a rear compartment physically relatively positioned with respect to each other

and with respect to the citrus fruit juice expressing machine when in cooperative relation with respect thereto whereby said front compartment of said receiving pan means will be cooperatively positioned to receive virtually all of the citrus fruit peeling oil produced from a front zone as a result of the severing and impaling of the citrus fruit peeling, and whereby said middle compartment will be cooperably positioned to receive expressed citrus fruit juice from a middle zone and having less than a preselected percentage of citrus fruit peeling oils and liquids therein, and whereby said rear compartment of said receiving pan means will be cooperatively positioned to receive citrus fruit peeling oil and liquids expressed from the citrus fruit peelings in a rear zone of greatest compression and damage thereto; said front and rear compartments being provided with outlet conduit means cooperable therewith to drain off the citrus fruit juice from the front and rear zones and containing citrus fruit peeling oil and liquids in excess of a preselected percentage; said middle compartment being provided with a separate outlet conduit means cooperable therewith to drain off the expressed citrus fruit juice from the middle zone and having less than a preselected percentage of undesirable citrus fruit peeling oils and liquids therein.



---

**2,774,298**

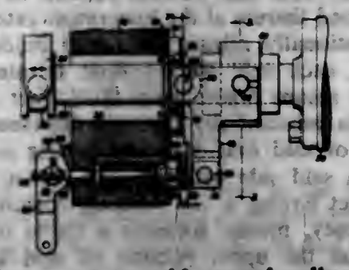
## SELECTIVE FEED AND PRINT CONTROL MEANS IN ACCOUNTING MACHINES

Everett H. Placke, Willis E. Eickman, and Charles S. Nagy, Dayton, Ohio, assignors to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland

Application January 28, 1955, Serial No. 484,709
53 Claims. (Cl. 101—93)

1. In a machine of the class decribed, the combination of a plurality of means to record data in columns on a plurality of record materials, one recording means being provided for each column, line-spacing means to line-space the record materials, sensing means coacting with the record materials, means controlled by the sensing means when one of the plurality of record materials is fed into position to receive data on the last line thereof to disable one of the column-recording means for the other record material; and means set under control of the sensing means to disable the last-named means when the record materials are simultaneously fed into positions to receive data on the last lines thereof to thereby cause the data to be printed in the said one column on the last lines of the record materials.

---



**2,774,299**

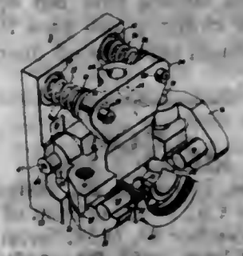
## SOCKET FOR INK CYLINDER

Cornon Walter Chase, Oak Park, Ill., assignor to The Goss Printing Press Company, Chicago, Ill., a corporation of Illinois

Application February 18, 1955, Serial No. 489,091
7 Claims. (Cl. 101—348)

7. In a printing press, the combination comprising a side frame, a pair of ink transferring rollers spaced from one another, an ink cylinder having a shaft and arranged to engage said ink rollers, a bearing including a bushing surrounding the end of said shaft, a yoke having spaced arms extending along the axis of said shaft, said yoke having a transverse pivot connection with said bushing at its inner end and having a pivot connection with the press frame at its outer end, said pivot connections being parallel to one another and in the region of the axis of said shaft so that the cylinder is guided for movement

centrally with respect to said spaced rollers, said yoke having a cross member interconnecting said arms for maintaining them spaced apart a greater distance than the outer diameter of said bushing so that the bushing is free to move sideways between said arms over a limited range, thereby to enable said cylinder to assume a precisely centered condition relative to said spaced rollers, and means for biasing said yoke toward said rollers.



---

**2,774,300**

## SOCKET FOR INK ROLLER

Cornon Walter Chase, Oak Park, Ill., assignor to The Goss Printing Press Company, Chicago, Ill., a corporation of Illinois

Application February 18, 1955, Serial No. 489,099
13 Claims. (Cl. 101—348)

1. In a printing press the combination comprising a side frame, a pair of ink cylinders laterally spaced from one another, an ink roller having a shaft and arranged to engage said ink cylinders, a bearing surrounding the end of said shaft, a yoke extending generally in the direction of the axis of said shaft, said yoke having a hinge connection with said frame and arranged perpendicular to the roller axis at one end and having a pivoted connection with said bearing at the other end, means for biasing the yoke relative to the frame, the hinge connection between the frame and the yoke having provision for changing the direction of the hinge axis with respect to the axis of the roller to vary the direction of the force applied to the roller by the yoke so as to proportion the forces applied by the roller to the individual ink cylinders.

---

**2,774,301**

## INK ROLLER MOUNTING FOR PRINTING MACHINES

Emory W. Worthington, Dobbs Ferry, N. Y., assignor to R. Hoe & Co., Inc., New York, N. Y., a corporation of New York

Application May 13, 1953, Serial No. 354,709
13 Claims. (Cl. 101—352)

1. An ink motion roller mounting for printing machines comprising, in combination, a roller supporting member, means movably mounting the said member on a machine frame for movement toward and away from a printing machine element cooperating with the roller, and means for resiliently urging the roller supporting member toward the cooperating element, comprising a flexible gas container, means for maintaining gas at a predetermined

pressure therein, and means fixed to the machine frame supporting the said container in pressure sustaining relation to the said roller supporting member.

---

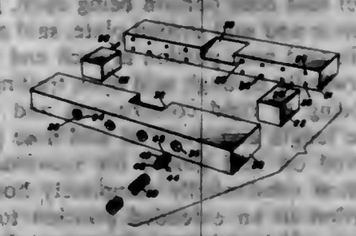
**2,774,302**

## FLEXIBLE PRINTING PLATE

Reidar Strömme, Boston, Oslo, Norway

Application June 8, 1954, Serial No. 435,258
Claims priority, application Sweden June 15, 1953
4 Claims. (Cl. 101—378)

1. Flexible printing plate means for attachment to a curved printing bed having magnetic means, said printing plate means comprising a flexible, non-magnetic printing plate in combination with a substantially continuous layer of elements of magnetizable material fastened to the rear face of the plate in such an arrangement that the printing plate retains its flexibility for disposal around a printing cylinder.



---

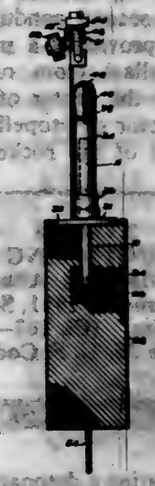
**2,774,303**

## LOCKING DEVICE FOR LINE SLUGS

Clarence A. Kelley, Lake Villa, and Jerome S. Jervan, Waukegan, Ill.

Application August 17, 1954, Serial No. 450,451
5 Claims. (Cl. 101—392)

1. A printing form holder for holding a group of line slugs within a printer's chase, comprising a holding and locking frame for said slugs, consisting of a backing bar provided with spaced attaching means, exchangeable spacer blocks, selected from a group of blocks of varying lengths and provided with means for detachably attaching them to the attaching means of the backing bar, two of said spacer blocks the length of which corresponds to the number of line slugs to be held, being attached to the backing bar in positions so spaced on the said backing bar that the distance at which they are attached corresponds to the length of the line slugs, a pressure bar applied against said spacer blocks, chase filling elements within the printer's chase applying pressure against the pressure bar, said pressure bar carrying spring pressed pressure pins, projecting from said pressure bar, the line slugs after insertion into the space between the spacer blocks and the backing and pressure bars, being resiliently held in one direction between the backing bar and the pressure bar by the spring pressed pressure pins projecting from the pressure bar while the slugs are laterally held against longitudinal displacement by the spacer blocks held on the backing bar.



**2,774,304**

## BOTTOM FIRING DETONATOR

John L. Wornel, Palisades, N. Y., assignor to the United States of America as represented by the Secretary of the Navy

Application March 12, 1953, Serial No. 341,867
1 Claim. (Cl. 102—7)

In combination with a casing containing an explosive, a bomb arming mechanism comprising, an elongated hollow element in said casing, said elongated element having a portion protruding through said casing, percussive material within said hollow element, said element being adapted to collapse suddenly upon exposure to pressure exceeding a predetermined intensity, a frangible envelope enclosing said protruding portion and isolating said portion from ambient pressures, a pivoted arm mounted in a position to strike said frangible envelope, resilient means exerting a force upon said arm, latch means for preventing said arm from striking said envelope, and inertial means for unlatching said arm.

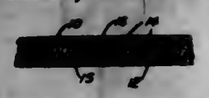
---

**2,774,305**

## ROCKET STEERING SYSTEM

Thomas W. Fitzgerald, Kenmore, and Robert W. Farren, Williamsville, N. Y., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Application July 9, 1952, Serial No. 297,936
1 Claim. (Cl. 102—49)



A system for steering rocket-propelled vehicles in space by shifting the center of mass of the vehicle with respect to the vector of propelling thrust by controlled movement of liquid ballast comprising, a pencil-shaped rocket having a propelling means producing thrust directed rearwardly along the longitudinal centerline of the rocket, said rocket including a housing, four radially-positioned walled liquid storage compartments within the housing and defined by radial partitions located at 45°, 135°, 225°, and 315° with respect to the longitudinal centerline of the rocket, a common cylindrical outer wall and a common cylindrical inner wall for the compartments with each cylindrical wall being concentric with the centerline of the rocket, a first conduit situated so as to pass through the 315° and 45° partitions in order to establish communication between compartments joining the 315° and 45° partitions, a second conduit situated so as to pass through the 315° and 225° partitions in

order to establish communication between compartments joining the 315° and 225° partitions, a first pump means located in the compartment bounded by the 315° and 45° partitions and operatively engaged to the first conduit, and a second pump means located in the compartment bounded by the 315° and 225° partitions and operatively engaged to the second conduit, the arrangement of the first and second conduits and the first and second pump means providing a means for selectively transferring liquid ballast from one compartment to another so as to shift the center of mass of the rocket with respect to the vector of propelling thrust to control the direction of flight of the rocket.

---

2,774,306
MEANS FOR INITIATING EXPLOSION
Norman A. MacLeod, Altadena, Calif.
Application November 6, 1951, Serial No. 255,129
1 Claim. (Cl. 102—70)
(Granted under Title 35, U. S. Code (1952), sec. 266)

A device for propagating a detonation wave, comprising a sheet formed of spaced sheaths of flexible plastic, spacing members between said sheaths forming a network of interconnecting interstices, and flexible explosive material filling said interstices and forming a plurality of separate paths interconnected at a plurality of points along their length for propagation of a wave front.

---

2,774,307
ROTARY PUMP
Emil Zepp, Mannesbeim, Kreis Bruchsal, Germany, assignor of one-half to Heinrich Schiez, Mannheim, Germany
Application December 3, 1952, Serial No. 323,743
Claims priority, application Austria February 19, 1952
5 Claims. (Cl. 103—93)

1. A rotary pump for gases and for liquids comprising a rotatable shaft, a pump wheel having a hub portion mounted on said shaft and having a peripheral portion, a plurality of blades mounted on and extending outwardly from said peripheral portion substantially radially of the rotation axis of said shaft and affording flow of the medium to be pumped in a direction substantially parallel to the rotation axis of said shaft, said blades having leading edges positioned in an imaginary plane which is at a right angle to the rotation axis of said shaft, said blades having trailing edges positioned in an imaginary plane which is at a right angle to the rotation axis of said shaft and spaced from the plane in which said leading edges are positioned, and a pump casing surrounding said pump wheel, said casing having a cylindrical outer wall portion whose interior surface is adjacent to said blades, said casing having interior wall portions individually opposed to said leading edges and to said trailing edges and being individually wound around the rotation axis of said shaft in helixes whose generatrices are at a right angle to the interior surface of said cylindrical wall portion for forming an inlet channel and an outlet channel for the medium pumped by said pump wheel.

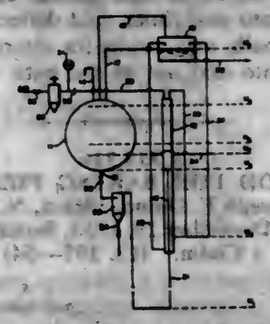
2,774,308
RADIAL FLOW IMPELLERS
Per Helge Nathanael Ulander, London, England, and William Hepples Johnston, Glasgow, Scotland
Application April 22, 1952, Serial No. 283,534
5 Claims. (Cl. 103—97)

1. A centrifugal impeller comprising a back plate, an annular shroud plate disposed co-axially with and spaced from said back plate, a plurality of blades each backwardly inclined with respect to the direction of rotation of said impeller, each blade including a nose portion and a tail portion, said nose portion comprising a rigid, hollow structure of airfoil cross section extending between said back plate and said shroud plate and fixed thereto, the trailing edge of said nose portion being open, guides fixed to said back plate and said shroud plate, said guides being disposed within said nose portion at each end thereof and extending rearwardly through said open trailing edge, said tail portion being of rigid construction and of substantially the same length and width as said nose portion and slidably received on said guides for movement from a retracted position substantially completely housed within said nose portion to an extended position to provide a blade having a width substantially twice the width of said nose portion and means to secure said tail portion in adjusted position.

---

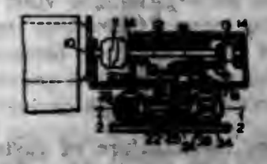
2,774,309
PUMP
Ludwig T. Stoyke and Oliver W. Schadlow, Rockford, Ill., assignors to Sundstrand Machine Tool Co., a corporation of Illinois
Application August 14, 1953, Serial No. 374,252
3 Claims. (Cl. 103—126)



1. A gear pump comprising, a casing having a cylindrical pumping chamber with inlet and outlet ports, an internal ring gear rotatably mounted in the chamber, a pinion of the same thickness as and meshing with said ring

gear, a shaft supported eccentrically of said chamber and carrying said pinion gear, said pinion gear having an external diameter less than the internal diameter of the ring gear to provide an arcuate space therebetween, a member of substantially the same thickness as the gear and pinion fixed in said chamber and located in said space, said member being tapered at each end to give the member substantially the shape of a crescent with said ends being located adjacent the inlet and outlet ports of the chamber, a plate closing one end of the chamber and contacting one suface of the gear and pinion in sealing relationship, said member having a bevelled portion extending from side to side of said member along one surface thereof beginning near the center of said surface and terminating short of the outlet end of said member to provide a passage sealed from said outlet port and defined between said member and said plate, said bevelled portion increasing in depth from adjacent said outlet end to said beginning whereby said passage gradually decreases in volume from its beginning toward the outlet port, a passageway connecting said passage with the outlet port, said passage establishing communication between the outlet port and a plurality of gear spaces in the ring and pinion gears immediately preceding the outlet port to introduce into said gear spaces a gradually decreasing volume of oil at substantially outlet port pressure.

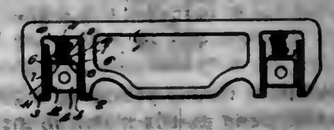
---



2,774,310
PUMP
James C. Ward, Jr., Phillips, Tex., assignor to Phillips Petroleum Company, a corporation of Delaware
Application February 20, 1953, Serial No. 338,069
6 Claims. (Cl. 103—234)

1. A gas powered pump comprising, in combination, a storage tank; a vent conduit in the upper end portion of said storage tank; a liquid outlet in the lower end portion of said storage tank; a sludge pot below said storage tank, a conduit connecting the liquid outlet of said tank and said sludge pot; means defining a feed chamber positioned beside said storage tank, the top of said feed chamber being at approximately the level of the top of said storage tank and the bottom of said feed chamber being below the bottom of said storage tank; a constant level device located at a level above said storage tank; a vapor return conduit extending from the upper end of said constant level device to the upper portion of said storage tank; a liquid overflow line extending from the central portion of said constant level device to said storage tank; a conduit extending from said constant level device to a point of consumption; a conduit extending from the lower end portion of said feed chamber to said constant level device; a first U-shaped conduit comprising a first leg communicating with the upper end portion of said feed chamber and a second leg communicating with said constant level device, the bottom of said first U-shaped conduit being at a level above the lower end portion of said feed chamber, means in addition to said conduit extending from the lower end portion of said feed chamber to said constant level device to supply liquid being pumped from said feed chamber to said first U-shaped conduit; a second U-shaped conduit extending from the upper end portion of said sludge pot up into the said feed chamber, the end of said conduit in said feed chamber being at a level approximately equal to the lower end portion of said supply tank and the distance between the upper end of the conduit extending into said feed chamber and the lower portion of said second U-shaped conduit being greater than the length of the second leg of said first U-shaped conduit; and a gas supply conduit communicating with the upper end portion of said feed chamber for introducing gas thereto.

---



2,774,311
CONSTRUCTION OF TOY LOCOMOTIVE
Jack H. Berry, Chicago, Ill.
Application July 29, 1953, Serial No. 370,980
3 Claims. (Cl. 105—99)

1. A toy locomotive traction truck comprising a unitary bolster and hollow king pin, the bolster portion being hollow, having end walls and formed by an upper member and a lower member meeting along a horizontal plane passing through the midportion of the bolster, a freely rotating vertical shaft passing through the king pin and terminating within the interior of the bolster, the bolster being provided with a horizontal opening in either end wall centered on the said horizontal plane and surrounded with protruding collar members having enlarged portions in spaced relationship with the bolster end walls, a rotatable horizontal unitary shaft mounted in the said horizontal plane within the bolster and extending through and beyond the said end wall holes, the vertical shaft being connected by gear means to the horizontal shaft, hollow gear boxes having end walls formed by an upper member and a lower member joined along a horizontal plane in their midportion, the gear boxes further provided with openings centered on the said horizontal plane and in the end walls, said openings being adapted to interlock with the said bolster collars forming a rotatable mounting, axles mounted within the gear boxes extending beyond the sides thereof and centered on the said horizontal plane, the horizontal shaft being connected by gear means to the axles, whereby rotary motion induced in the vertical shaft may be transferred to the axles independently of rotation of the bolster about the axis of the king pin and independently of rotation of the axles about a horizontal axis at right angles to the said axles.

---

2,774,312
PEDESTAL GUIDE ASSEMBLY
William T. Rossell, New York, N. Y., assignor to Transit Research Corporation, New York, N. Y., a corporation of New York
Application July 29, 1952, Serial No. 301,570
5 Claims. (Cl. 105—224)

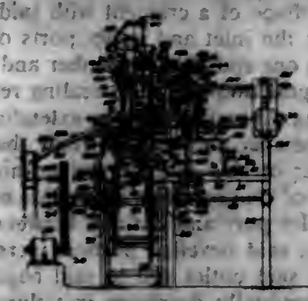
1. In a rail truck, a truck frame having pairs of pedestal guides, a journal bearing positioned between the members of each pair of said guides, spring means supporting said frame from said bearings and providing for relative vertical movements therebetween, a friction plate interposed between said spring means and each of said

journal bearings, said pedestal guides limiting the movements of said journal bearings and said plates longitudinally of said frame, said spring means urging said plate constantly against one of its guides, said bearing being movable longitudinally of said frame against the friction of said plate as permitted by the spacing of the members constituting said guides.

---

2,774,313
**RAVIOLI MACHINE**
Louis G. Lombi, West Englewood, N. J., assignor to Ezio L. Lombi, West Englewood, N. J.
Application November 14, 1955, Serial No. 546,538
3 Claims. (Cl. 107—1)

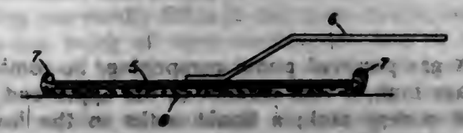
1. Machine for manufacture of ravioli and the like comprising a die roll having mold cavities in the surface of the same, means for imparting rotative movement to said die roll, means for applying a first layer of material over the top of the die roll, a nozzle for depositing filling material over said first layer of material on the die roll, means for sucking the applied layer of material into the die cavities as they reach a position beneath said filling material nozzle, means for applying a layer of cover material over said first layer and the deposited filling material and means for applying fluid pressure to the mold cavities as they reach a position at the bottom of the roll, said filling material nozzle being shaped to the approximate curvature of the die roll and being shiftable toward and away from the layer of material overlying the top of the die roll.



---

2,774,314
**VARIEGATORS**
Frank T. Moser, Easton, Pa., assignor to American Food Laboratories, Inc., Brooklyn, N. Y., a corporation of New York
Application May 26, 1954, Serial No. 432,383
16 Claims. (Cl. 107—1)

1. In combination, means providing a passageway for an edible flowable pasty matrix material, means for introducing at least one stream of an edible flowable variegating material into the matrix material flowing through said passageway, and stationary branching means located in the path of travel of said stream of variegating material for dividing said stream of variegating material into continuously flowing outwardly displaced smaller streams.



2,774,315
**AUTOMATIC CONE MAKING MACHINE WITH STATIONARY ROLLER UNIT**
Albert A. Heyman, Baltimore, Md., assignor to The Maryland Baking Company, Baltimore, Md., a corporation of Maryland
Application July 14, 1952, Serial No. 298,875
8 Claims. (Cl. 107—4)

1. An automatic cone making machine comprising a movable chain of waffle irons for baking wafers to be rolled into cones, said waffle irons comprising each a base member and a hinged cover member, a stationary unit adjacent said chain for rolling said wafers into cones, said unit comprising a stationary hollow inverted cone mold and a cooperating spinner core, said mold having a slotted inlet for the wafers and a scraper member adjacent said inlet, means for intermittently inserting said spinner core in and removing it from said mold, means for rotating said core during its insertion in said mold, means for arresting the rotation of said core and stripping cones therefrom upon removal thereof from the mold, a chute for receiving said stripped cones, a deflector in the path of movement of said spinner core for deflecting stripped cones into said chute, said deflector being removable from said path, and means for intermittently moving said deflector into and out of the path of movement of said core.

---

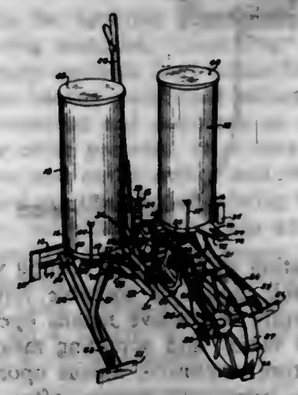
2,774,316
**METHOD FOR BAKING PIZZA PIE**
Joseph F. Daino, Ithaca, N. Y.
Application December 29, 1953, Serial No. 400,891
1 Claim. (Cl. 107—54)

The method of preparing a pizza shell which consists in taking a flat proofed sheet of pizza dough of the general peripheral contour desired and placing on its central area a flat control plate of heat conducting material having a similar peripheral contour but of sufficiently smaller diameter to leave an upwardly exposed border around the rim of the dough, the dough is then given a preliminary baking during which it is restrained from rising in its central area by the downward pressure of the inherent weight of said control plate applied thereover with the effect that a shallow pizza shell is formed due to the greater vertical rise of the unrestrained rim portion, the preliminary baking being terminated after the pizza shell is definitely formed in its final contour but before it is finally browned, whereby a fully formed pizza shell may be manufactured as a brown-and-serve dish.

---

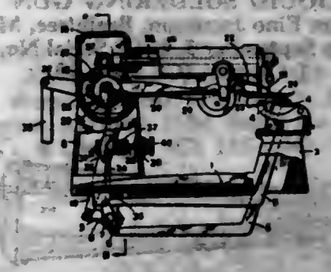
2,774,317
**BOILER BASE**
Marvin E. King, Cambra, Pa.
Application March 4, 1952, Serial No. 274,708
9 Claims. (Cl. 110—96)

1. A firebox-providing boiler base section providing a boiler-supporting seat adjacent its top and having open-



ings at a plurality of lateral sides, interchangeable closure plates for said openings, means detachably securing said closure plates to said base over said openings, a door carried by one of said closure plates and affording access to the firebox interior, and a burner unit for disposition

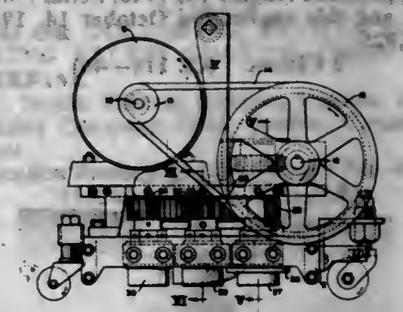
within said base through a selected one of said openings, said burner unit incorporating one of said plates as a closure for said openings and positionable over a selected one of the latter when the burner is in operative position within said base.



---

2,774,318
**SIDE DRESSING FERTILIZER SPREADER**
Clarence J. Johnson, Helenon, Wis.
Application December 10, 1952, Serial No. 325,119
2 Claims. (Cl. 111—59)

1. In a fertilizer spreader, a transportable frame, a pair of laterally spaced fertilizer receptacles fixedly mounted upon said frame and each having a rear lower outlet, a rearwardly and downwardly inclined fertilizer distributing trough suspended from said frame beneath each of said receptacles and each having its trailing lower end formed to travel beneath the ground to produce a shallow trench, means for effecting lateral adjustment of each of said troughs relative to the adjacent receptacle to vary the distance between the troughs, a flexible fertilizer conducting conduit connecting each receptacle outlet with the lower end portion of the adjacent trough for distribution of the fertilizer within said trenches, a plow blade carried directly by the trailing end of each trough for promptly covering the fertilizer deposited within said trenches, a rotary disk within each of said receptacles for controlling the flow of fertilizer through the said outlets, a transverse shaft journalled on said frame and connected by bevel gearing to both of said disks, a pair of laterally spaced rearwardly extending rigid beams having their front ends swingably suspended from said shaft between said receptacles, a ground engaging wheel journalled on the rear ends of said beams and propelled along the ground during the forward advancement of the frame, a drive for imparting rotary motion from said wheel to said shaft, a lever secured to at least one of said beams for elevating said wheel from the ground, and a spring coacting with said frame and with a medial portion of one of said beams for constantly urging said wheel toward ground engaging position.



2,774,319
**BLIND STITCH SEWING MACHINES**
Edward Franklin, Alwoodley, Leeds, and Norman Adamson, Oakwood, Leeds, England
Application July 23, 1953, Serial No. 369,845
3 Claims. (Cl. 112—176)

1. In a blind stitch sewing machine, the combination of a stationary body portion, a work support having at least one plunger, said work support arranged to be stationary during normal operation of the machine, an elongated head extending forwardly from said machine body at right angles thereto and in a direction parallel to the line of feed and carrying at its forward outer end a needle plate, needle, looper and feeder and their operating connections, said head having its rear end pivotally mounted on said machine body behind said work support so that when its forward outer end is raised angularly the widest part of the gap for insertion and removal of the work is nearest to the operator, and a manually operable means connected to said pivoted head for enabling the operator to lower and raise the forward outer end of said head with its associated parts towards and away from said stationary support to allow insertion and removal of the work.

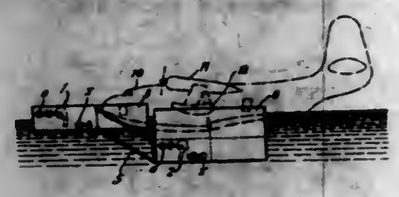
---

2,774,320
**METAL ROOF SEAM FORMING MACHINE**
Thomas J. Boyd, Cross Creek District, W. Va., assignor, by mesne assignments, to Charles H. Manion, Wellsburg, W. Va., and Thomas J. Boyd, Cross Creek District, W. Va.
Application November 15, 1952, Serial No. 320,747
2 Claims. (Cl. 113—55)

1. A metal roof seam forming machine comprising a body, wheels carried by the body for rolling the machine along a roof, a series of means carried by the body aligned generally in the direction of movement of the machine along the roof for progressively turning projecting edges of metal roofing material to form a seam upon movement of the machine along the roof, each of said means comprising a roll mounted in the body for rotation about a fixed axis and a portion movable transversely of the body in opposed relationship to the roll, two of said transversely movable portions each comprising a roll and a support in which the roll is journaled for rotation, the body having guide means for each of such supports guiding the same in a fixed transverse path, a third such transversely movable portion comprising a deflector adapted for sliding action against the edges being formed into a seam and being disposed between and guidingly mounted in said supports, and means resiliently urging

each of the supports and the deflector toward the roll mounted in the body for rotation about a fixed axis which cooperates therewith.

---

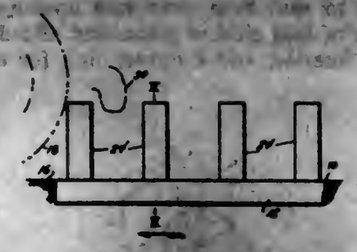


2,774,321
LIQUID SOLDERING GUN
William Elmo Jacobsen, Braintree, Mass.
Application September 5, 1952, Serial No. 308,837
1 Claim. (Cl. 113—93)

In a soldering tool, an elongated casing having forward and rear ends, a tubular solder reservoir within said casing, said reservoir having a rear end, means closing the rear end of the reservoir, said reservoir having a forward end portion projecting forwardly beyond the forward end of said casing, said forward end portion having a longitudinal eccentric passage extending therethrough, transverse rod means on said end portion, said rod means having ends projecting beyond opposite sides of said end portion, a tip having a socket rotatably receiving said end portion, said tip having circumferentially spaced slots receiving the ends of the rod means, said slots being wider than the ends of the rod means, said tip having a longitudinal eccentric passage therethrough registrable with the passage in the reservoir end portion in one position of rotation of the tip relative to the reservoir.

---

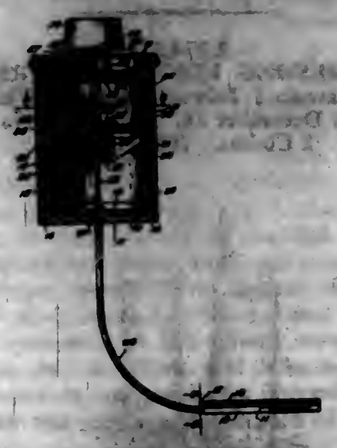
2,774,322
WATER-BORNE AIRPLANE TERMINAL
Frederic R. Harris, deceased, late of New York, N. Y., by Florence R. Downe, Michael S. Lobenthal, and Monroe Percy Bloch, executors, all of New York, N. Y., assignors to Frederic R. Harris, Inc., New York, N. Y., a corporation of New York
Original application August 14, 1946, Serial No. 610,749. Divided and this application October 14, 1953, Serial No. 386,825
3 Claims. (Cl. 114—46)



1. A marine terminal for seaplanes comprising a pontoon having a hull having a bottom and a deck with elevated walls at its sides, a second pontoon having a recess in one end of full depth opening through the deck and bottom presented to the first pontoon, and beams in said recess at the sides thereof pivotally linked to both pontoons to permit up and down movement of one with respect to the other.

---

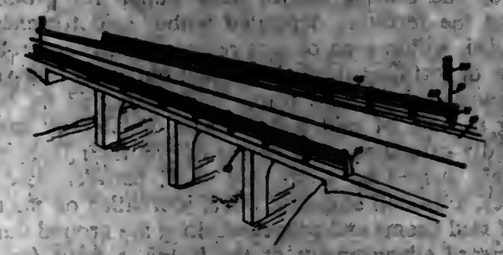
2,774,323
AUDIO ROAD SIGNAL
Everett S. Kirk, Lima, Ohio
Application May 18, 1956, Serial No. 589,139
6 Claims. (Cl. 116—63)



1. In a device for imparting an audio signal to the occupant of a vehicle moving along a highway, a base element longitudinally extending along and affixed to the highway, said base element provided with a series of seats therealong, a compressible body interlocked in each seat

and an integral flexible finger upwardly extending from said body.

---

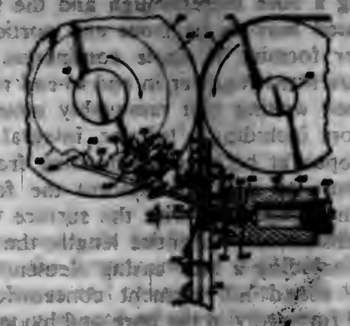


2,774,324
SIGNALLING DEVICE
Lawrence H. James, Glen Ellyn, Ill.
Application April 1, 1953, Serial No. 346,138
11 Claims. (Cl. 116—109)

1. In combination with a liquid heating vessel adapted to boil a wettable liquid, a wettable liquid contained therein, temperature responsive means operatively associated with said vessel, and actuating means responsive to said temperature responsive means upon exposure of said temperature responsive means, after immersion in the wettable liquid, to the area immediately adjacent the top surface of boiling wettable liquid and the drop in temperature of the surface of the temperature responsive means upon evaporation of the last liquid therefrom, said actuating means serving to actuate indicator means which serves to indicate when the liquid level of boiling wettable liquid falls below a predetermined level.

---

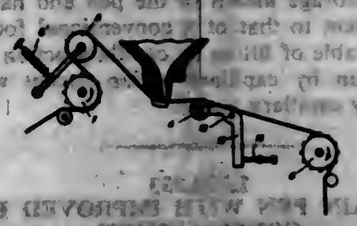
2,774,325
BRIDGE WARNING DEVICE
Charles H. Budde, St. Louis, Mo.
Application August 8, 1952, Serial No. 303,688
5 Claims. (Cl. 116—114)



1. A warning device for a bridge to indicate washout, said device comprising a cable extending the full length of the bridge, means anchoring one end of said cable, a housing in which the opposite end of said cable is disposed, a warning device having a part and movable to a position across at least one lane of the bridge, means piv-

otally connecting said post to said housing, a movable stop in said housing and contacted by said post to hold said post erect, frangible means connecting said stop to said cable in order to prevent said cable from applying excessive force to said movable stop but transmitting sufficient force from said cable to said top to actuate the latter, and resilient means reacting on said stop and said housing constantly urging said stop in a direction to engage and hold said post.

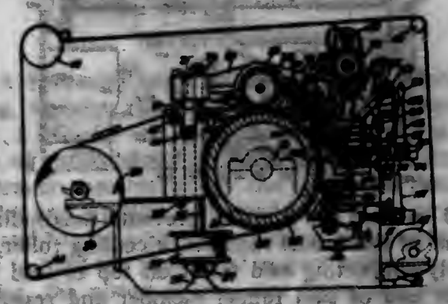
---



2,774,326
AUTOMATIC GLUE APPLYING APPARATUS
Victor A. Nelson, Portland, Oreg.
Application July 18, 1950, Serial No. 522,561
6 Claims. (Cl. 118—12)

1. Apparatus for applying glue intermittently to continuously moving material, comprising, in combination with continuously movable feed means for said material, glue applicator means positioned adjacent the outfeed path of said material and including an outlet orifice, a source of glue under pressure, valve means interconnecting said source and outlet orifice and movable between open and closed positions for regulating the flow of glue to said orifice, valve actuating means connected to said valve means, and timed operating means connected to the actuator means and driven by the moving feed means for actuating said valve means to open and closed positions intermittently on a predetermined cycle during continuous movement of the feed means.

---



2,774,327
APPARATUS FOR PRODUCTION OF COATED TAPE
Albert Barbier, Saint-Ouen-les-Paris, Paris, France
Application June 28, 1952, Serial No. 296,111
Claims priority, application France July 19, 1951
9 Claims. (Cl. 118—33)

1. An apparatus for depositing a sound track on a flexible film, comprising a nozzle a part of which is shaped externally according to a cylindrical surface, and provided with at least one slit along a part of said cylindrical surface, the upstream edge of said slit being substantially coincident with the generatrix of said cylindrical surface situated at a location where said film leaves said cylindrical surface tangentially thereto, while the downstream edge of said slit is constituted by the lower edge of a scraper situated on the extension of said cylindrical surface at a predetermined distance from the line from which said film leaves said cylindrical part, so that said lower edge of said scraper is situated at a level above the path of travel followed by said film from the line at which said film leaves said cylindrical part, means for advancing the film past the nozzle, and means for causing the film to pass over and in contact with a substantial portion of the cylindrical surface immediately upstream of the slit.

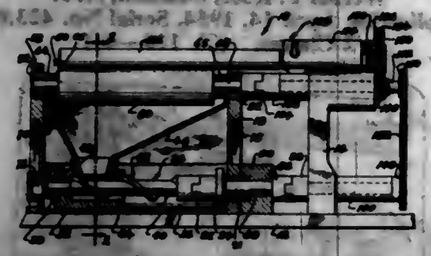
---

2,774,328
TIPPING ATTACHMENT FOR CLOTH EMBOSSING MACHINES
Werner P. Rees, Oakland, N. J.
Application April 14, 1954, Serial No. 423,099
2 Claims. (Cl. 118—44)

2. A combined cloth embossing and ink tipping machine comprising an engraved embossing press roll and a backing roll having a complementary raised pattern, a tipping attachment having a tipping roll with recesses therein to escape the tipping of certain of the embossed portions of the cloth, a second tipping attachment spaced from the first tipping attachment and having recesses therein for permitting the escape of the projections tipped by the first attachment and effecting the tipping of the remaining projections, said backing roll having a large gear thereon, one of the said tipping attachments having a gear meshing with the large gear to be driven by the same and the other of said tipping attachments having an adjustable gear meshing with the large gear whereby adjustment of the tipping roll of one machine can be effected relative to the recessed tipping roll of the other attachment.

---

2,774,329
WIPING OR DOCTORING DEVICES FOR REMOVING EXCESS COATING FROM SHEET MATERIAL
Roland V. Smith, Ottawa, Ontario, Canada, assignor to E. B. Eddy Company, Hull, Quebec, Canada, a body corporate
Application January 25, 1954, Serial No. 405,909
11 Claims. (Cl. 118—118)



1. A wiping device for doctoring coated sheet material comprising a wiping rod of magnetic material rotatable about its longitudinal axis, a seat for said rod and magnetic means holding said rod in said seat.

---

2,774,330
COATING MACHINE
Charles F. Schaefer, Stratford, Conn.
Application March 30, 1954, Serial No. 419,827
15 Claims. (Cl. 118—259)

1. A coating machine comprising a base, a tank for coating solution removably mounted on said base and

having a laterally extending well at the bottom thereof, a pump housing seating in said well and removable upwardly from the latter, said housing having an outlet at the top thereof and accommodating a pumping member operative to propel coating solution from said well through said outlet, an upwardly opening funnel member fitting removably in said tank and held against lateral displacement by the latter, said funnel member seating at its lower end in said outlet of the pump housing thereby to prevent lateral displacement of said housing in the

well and so that the housing prevents longitudinal displacement of the funnel member, a coating roller, means removably supporting said roller on top of said tank in the upper end of said funnel member and resisting upward movement of the latter relative to said tank, and means for driving said roller and said pumping member so that coating solution is pumped by the latter from said tank through said housing and funnel member to said coating roller and spills over the top of said funnel member to mix with the remainder of the coating solution in said tank.

---

2,774,331

## MARKING ELEMENT AND DISPENSING MEANS THEREFOR

John Sherman Smith, Atlanta, Ga., assignor to Scripto, Inc., a corporation of Georgia

Application June 24, 1953, Serial No. 363,769
3 Claims. (Cl. 120—13)

1. A marking element dispensing means comprising a housing having axially aligned rear and forward tubular portions separated by an inwardly extending annular flange and communicating through said flange, a feed mechanism arranged in said rear housing portion and incorporating a plunger extensible from said rear portion through said forward portion by operation of said feed mechanism at the rear end of said housing, a protective sleeve incasing a marking element supply retained by said housing in said forward portion, said protective sleeve being of a uniform interior diameter and being formed interiorly with longitudinal ridges extending throughout the length thereof, a flexible collar slidably disposed interiorly of said protective sleeve at the rear end thereof, a tubular assembly sleeve removably fixed within said forward tubular portion and surrounding said protective sleeve, the rear face of said assembly sleeve being spaced from said annular housing flange and said protective sleeve being formed with an outwardly extending flange at its rear end for retaining engagement with said housing between said assembly sleeve rear face and annular housing flange and overlying said assembly sleeve rear face, both said marking element supply and said flexible collar being of substantially the same diameter as the interior diameter of said protective sleeve and being gripped therein by said ridges while remaining free for sliding along said ridges within said protective sleeve, and said flexible collar frictionally gripping the forward end of said plunger for dispensing the marking element supply from said protective sleeve by said flexible collar and plunger through operation of said feed mechanism.

2,774,332

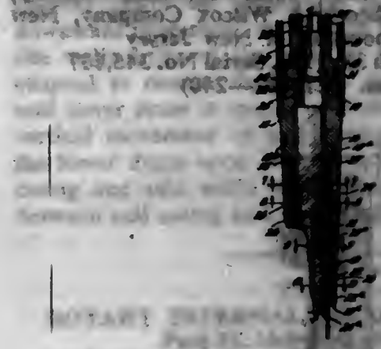
## FOUNTAIN PENS

Ivan D. Toft, Janesville, Wis., assignor to The Parker Pen Company, Janesville, Wis., a corporation of Wisconsin

Application January 9, 1952, Serial No. 265,649
3 Claims. (Cl. 120—50)

1. A capillary fountain pen comprising a pen body including a front section and a rear section, the front section having a bore therethrough and the rear section having a vented bore in its front end portion, the two bores together forming a single continuous bore when the sections are fitted together in end-to-end relation, and a self-contained writing unit removably mounted in the continuous bore including a tubular, integral casing and nib element open at both ends extending from the rear end of the bore to a point adjacent the forward end thereof and in engagement with the surface of the bore throughout substantially its entire length, the casing and nib element including a rear casing element and a forward arcuate slitted nib element concentric therewith and extending forwardly in the bore and having a tapered writing point, the casing and nib element forming a tube of uniform diameter and opening through each end at full-diameter dimension and the casing element being substantially longer than the nib element, said nib element being contained within said bore except its writing point which projects forwardly of the pen body, the casing element having a threaded portion intermediate its ends and the body sections having interior threaded portions engaged with the threaded portion on the casing element operative for securing the body sections together and mounting the writing unit in the body, and a unitary, substantially cylindrical, resilient capillary filler-and-reservoir element in and confined by said casing and nib element with a portion in capillary ink feeding relation with said nib element throughout substantially the entire arcuate dimension of the latter and substantially the entire longitudinal extent of the portion of the nib element disposed inwardly of the extreme forward end of the pen body, said filler-and-reservoir element being substantially longer than said nib element and substantially filling the casing and having capillary spaces distributed through its volume, said filler-and-reservoir element constituting the sole ink storage means in the pen and having a capacity equivalent to that of a conventional fountain pen and being capable of filling by capillary action and holding ink therein by capillary action except when it is written out by capillary action.

---



2,774,333

## FOUNTAIN PEN WITH IMPROVED FEED CONSTRUCTION

David Kahn, Englewood, N. J., assignor to David Kahn, Inc., North Bergen Township, N. J., a corporation of New Jersey

Application December 19, 1950, Serial No. 201,625
2 Claims. (Cl. 120—52)

2. In a writing instrument, a barrel, a nozzle having an upper tubular end seated in the lower end of said barrel, a shoulder arranged on said nozzle and abutting the lower end of said barrel, said nozzle being provided with a surface to prevent rotation of the nozzle in the barrel, said nozzle tapering downwardly so that it gradually decreases in diameter, a hood extending from the lower end of said nozzle and provided with a longitudinally extending arcuate groove for partially surrounding a nib having an aperture therein, a rib extending longitudinally along said groove and provided with a flat surface, said nozzle being provided with a longitudinally extending bore, a feed bar seated in said bore and provided with a capillary groove extending longitudinally therethrough and arranged in confronting relation with respect to said rib, the flat surface of said rib and capillary groove being arranged on opposite sides of said nib, the upper end of said nozzle being reduced

in diameter, said rib having its inner ends merging into the nozzle, the lower end of said rib terminating adjacent the lower end of said nozzle, said capillary groove terminating in spaced relation from the end of said feed bar, the bore in said nozzle including a plurality of aligned sections of increasing diameter, and a shoulder arranged on said nozzle between adjacent sections and defining a space around said feed bar to catch any overflow of ink.

---

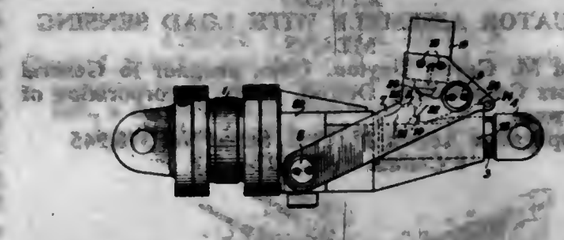
2,774,334

## RECIPROCATING PRIME MOVER

William H. Cline, Jr., Houston, Tex., assignor to Hughes Tool Company, Houston, Tex., a corporation of Delaware

Application May 1, 1953, Serial No. 352,544
14 Claims. (Cl. 121—28)

1. In a reciprocatory prime mover the combination comprising, a housing having an inlet at one end thereof for the admission of pressure fluid to the interior of the housing, an annular piston slidably mounted within the housing and having an end thereof peripherally reduced, a depending sleeve at the inlet to the housing forming with the housing an annular chamber, an end portion of the piston slidably fitting within said chamber, there being a passage between said chamber and the exterior of the housing, spaced seals between the piston and housing, and means for alternately confining pressure fluid within the piston and diverting the pressure fluid to the exterior of the piston between said seals to advance and retract the piston within the housing.



2,774,335

## HYDRAULIC LATCHES

David G. Loomis, Newark, N. J.

Application October 4, 1955, Serial No. 538,374
7 Claims. (Cl. 121—40)

1. A hydraulic latch of the character described comprising, a piston rod provided with a latch bar having a recess, a cylinder out of which the piston rod is extended, a pair of parallel links pivotally mounted on the cylinder, a hydraulic ram carried by the links, said ram having a cylinder and a piston, a pivoted latch pawl carried by the links and having a part for latching engagement with the recess to hold the piston rod against extension out of the cylinder, the piston of the ram being operative against the latch pawl to cause the cylinder of the ram to be moved to pivot the links and the latch to an extent to cause disengagement of the latch pawl from the recess under axial movement of the piston rod.

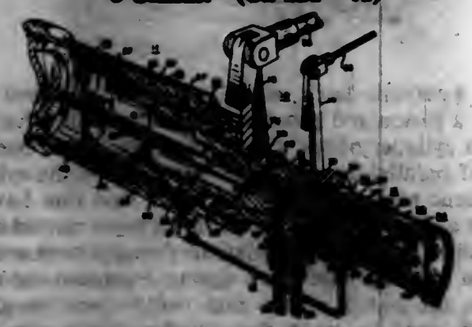
## LOCKING MEANS FOR FLUID MOTOR OR THE LIKE

Howard M. Geyer, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

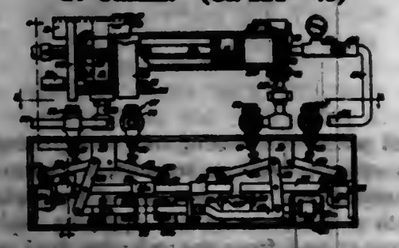
Continuation of abandoned application Serial No. 78,412, February 25, 1949. This application November 27, 1953, Serial No. 394,669
9 Claims. (Cl. 121—40)



1. A fluid pressure actuating unit, comprising in combination, a cylinder with a support, a piston movable therein, a piston rod movable along the cylinder and connected to a load, means for applying and draining fluid pressure to and from the cylinder, lock means cooperable with the cylinder and piston for maintaining an assumed position of the piston against movement by the load, including a screw threaded in the piston and extending along a central bore of the piston rod, a head member of the screw journalled in one end of the cylinder, a brake disc driven by the screw head and supported for axial movement thereof, a friction surface provided by the cylinder adjacent the disc and adapted to be engaged thereby, spring means supported by the head member of said screw normally effecting engagement between the disc and the friction surface, and means oper-

able coincident with application of fluid pressure to the said cylinder for disengaging the brake disc and friction surface.

---



2,774,337
**ACTUATOR ASSEMBLY WITH LOAD SENSING MEANS**
Howard M. Geyer, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application August 27, 1953, Serial No. 376,945
8 Claims. (Cl. 121—41)

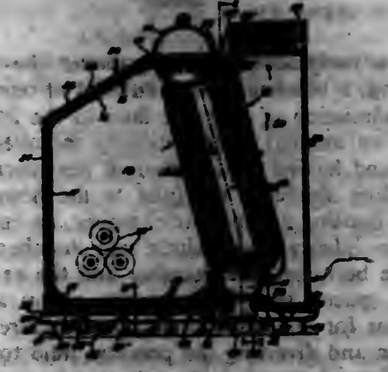
1. An actuator assembly including in combination, a fluid pressure operated power actuator comprising a cylinder having disposed therein a reciprocable piston capable of fluid pressure actuation in either direction, a manually operable actuator comprising a cylinder having disposed therein a reciprocable piston capable of manual actuation in either direction and a member operatively connected to said manually actuated piston so as to be rotated upon piston movement, and valve means disposed between the actuators and operatively associated with said actuators for controlling the application of pressure fluid to said power actuator, said valve means including a valve element integral with the rotatable member of said manually operable actuator so that movement of said manually operable actuator piston controls the application of pressure fluid to said power actuator, the construction and arrangement being such that the force required to actuate the manually operable actuator is proportional, percentagewise, to the force exerted by the power operable actuator.

---

2,774,338
**ELECTRO-MECHANICAL VALVE CONTROL MECHANISM**
Jesse J. Shackelford, Fairmont, W. Va., assignor to Fairmont Box Company, Consolidated, N. Y., a corporation of New York
Application June 3, 1953, Serial No. 359,245
10 Claims. (Cl. 121—45)

1. A piston control device comprising, a piston, a cylinder, a source of fluid under pressure communicating with the cylinder adjacent each end thereof, intake valves for controlling the admission of fluid, exhaust valves communicating with the cylinder adjacent each end thereof, a frame, a pair of longitudinal shafts mounted for oscillatable movement in said frame, said shafts being disposed in end to end relation and in the same horizontal and vertical planes, a plurality of spaced cams carried by said shafts for operating said intake and exhaust valves responsive to movement of the shafts, electrically operable means for oscillating said shafts for opening and closing the intake valves and the exhaust valves in pairs and switch means for actuating said electrically operable means in predetermined timed relation, thereby controlling the length of the piston stroke.

---

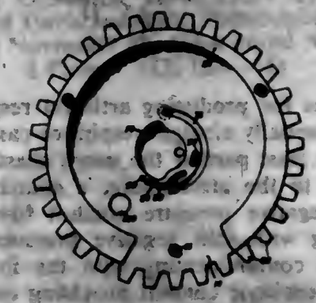


2,774,339
**FLUID HEATER FURNACE**
Wolfgang Jenkenmann, Oberhausen, Rhineland, Germany, assignor to The Babcock & Wilcox Company, New York, N. Y., a corporation of New Jersey
Application March 31, 1953, Serial No. 345,887
6 Claims. (Cl. 122—240)

1. A furnace unit having a pair of upright outer walls forming opposing lateral boundaries of a furnace chamber, upright partitions inwardly spaced from said lateral boundaries and respectively defining therewith separate gas receiving compartments, said partitions defining an interior well space arranged to receive heating gases from said compartments, and through which space said gases are directed, said furnace chamber having a bottom wall common to said compartments and said well space, and furnaces in which the combustion of ring-forming solid fuel particles is effected, said furnaces having outlets through which gases of combustion from separate furnaces are discharged into the separate compartments against the respective partitions and deflected downwardly thereby toward said bottom wall, said partitions having lower ends upwardly spaced from said bottom wall at elevations lower than said furnace outlets and defining therewith areas through which said gases flow into a lower portion of said well space.

---

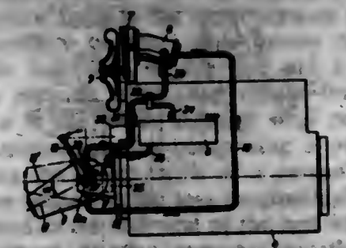
2,774,340
**VAPOR GENERATOR**
Henry J. Jankowski, North Plainfield, N. J., assignor to Foster Wheeler Corporation, New York, N. Y., a corporation of New York
Application March 15, 1954, Serial No. 416,283
6 Claims. (Cl. 122—510)



1. A vapor generator comprising two pairs of oppositely disposed walls, a roof and a floor, a casing enclosing

said walls, roof and floor, means forming a furnace chamber having a combustion gas outlet for discharging combustion gases from said chamber, firing means in said chamber for producing gases of combustion, an upper drum and a lower drum, a plurality of tubular members in communication with and extending between said drums and in heat exchange relationship with gases of combustion flowing to said gas outlet, said casing being secured to said upper drum, a foundation for supporting the casing, support means for supporting said lower drum against downward movement, said casing and a pair of said opposite walls adjacent the ends of said lower drum being adapted to receive therein the opposite end portions of said lower drum in spaced relationship thereto to provide vertical movement of said casing and walls relative to the lower drum upon expansion and contraction of said casing and said walls, and an expansion joint arranged between said casing and said foundation.

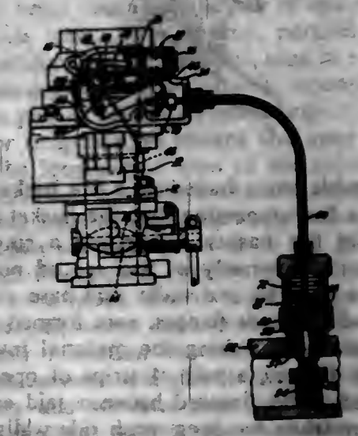
---



2,774,341
**ROTARY INTERNAL COMBUSTION ENGINE**
Paul M. Moore, Carlinville, Ill.
Application November 22, 1954, Serial No. 470,332
6 Claims. (Cl. 123—44)

1. A rotary internal combustion engine comprising a stator having a chamber therein, a rotor journaled in said chamber, a reaction member journaled in said chamber and having a circular ring surrounding said rotor, pairs of circumferentially spaced, radially disposed compressor and power cylinders in said rotor, pistons slidable in each cylinder and having their outer ends abutting said circular ring, said ring and said rotor having parallel axes of rotation, said stator having an end wall, means for supplying a combustible mixture to said compressor cylinders, means for transferring compressed combustible mixture from the compressor cylinders to the power cylinders, means for igniting combustible mixtures in the power cylinders, means for discharging exhaust products from the power cylinders each of said means including cooperating passages in said end wall and in said rotor.

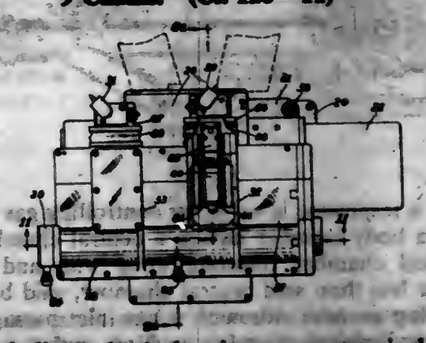
---



2,774,342
**INTERNAL COMBUSTION ENGINE**
Otto Schilling, Stuttgart-Untertürkheim, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany
Application January 18, 1955, Serial No. 482,943
Claims priority, application Germany January 9, 1954
16 Claims. (Cl. 123—119)

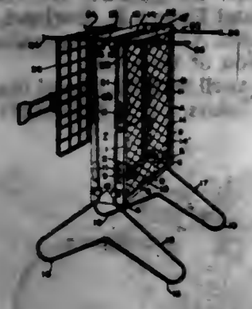
1. In an internal combustion engine, the combination comprising a supercharger, and a hydrostatic torque converter transmission for driving said supercharger, said hydrostatic torque converter transmission being provided with piston elements.

---



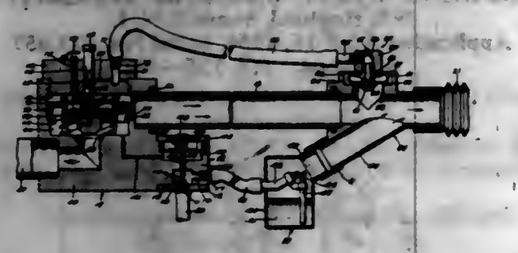
2,774,343
**CHOKE CONTROL DEVICE**
David J. Schaffer and Robert R. Dorland, Detroit, Mich., assignors to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application April 9, 1952, Serial No. 281,422
4 Claims. (Cl. 123—119)

1. In a choke control device of a carburetor for an engine having an induction passage with a choke valve mounted on a shaft therein: a vacuum responsive member operatively connected to said shaft for urging said valve toward opened position, a lever on said shaft, a spring connected to said lever, a link connected to said spring, resilient means having a one-way connection with said link adapted to constantly urge said choke valve toward closed position, a temperature responsive element having a one-way connection with said link adapted to oppose said resilient means.



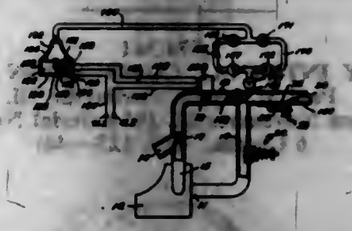
---

2,774,344
**GRINDING WHEEL DRESSING APPARATUS**
Nils Hoglund, Summit, N. J.
Application April 16, 1954, Serial No. 423,657
9 Claims. (Cl. 125—11)



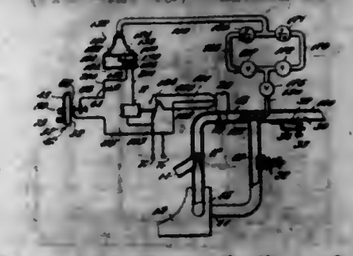
1. A grinding wheel dressing apparatus including a base, a frame slidably mounted on said base for movement in one direction, a dressing tool mounted on said frame and movable normally to said one direction, a first slide on said frame movable parallel to the movement of said frame, a second slide on said frame movable parallel to the movement of said tool, connections between said base and said second slide, connections between said tool and said first slide, and means connected between said first and second slides whereby movement of said one slide causes movement of said frame relative to said base while said tool remains stationary relative to said frame or causes relative movement of said tool with respect to said frame while said frame remains stationary with respect to said base.

2,774,345
**PORTABLE STOVE**
Stephen C. Peplin, Lakewood, Ohio, assignor to Lakewood Manufacturing Company, Westlake, Ohio, a corporation of Ohio
Application August 15, 1955, Serial No. 528,224
4 Claims. (Cl. 126—25)



1. A portable stove including a fire basket and a pair of main legs for supporting said fire basket in a vertical position, said fire basket comprising a single sheet of material bent transversely at two spaced points to constitute a base and two end walls, said base and end walls being formed with side flanges, ears formed in said base and end walls by punching the material inwardly adjacent the side flanges, a pair of strips of open mesh material adapted to be disposed between said ears and side flanges to constitute the open mesh side walls of said fire basket, horizontally extending ears formed near the bottom of each end wall by punching the material outwardly to engage and removably clamp the main legs, transversely extending brackets rigid with the upper ends of said main legs, vertically extending ears near the upper ends of said end walls to engage and clamp the center portions of said brackets.

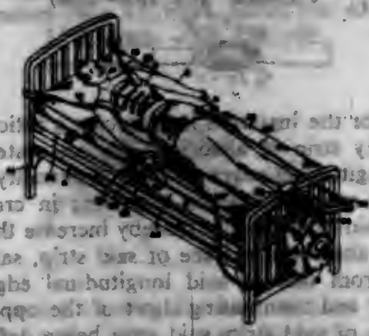
2,774,346
**RESPIRATOR**
Erle Palmer Halliburton, Corpus Christi, Tex., assignor to Dorothy L. Bischof, Los Angeles, Calif.
Application July 13, 1953, Serial No. 367,511
26 Claims. (Cl. 128—29)



1. In a respirator, a valve for controlling gas flow comprising a body member having a central chamber, and a cylindrical chamber communicating with and having a diameter less than said central chamber, said body member having an inlet side with a gas inlet passage leading to said cylindrical chamber and an outlet side with a gas oulet passage leading from said central chamber; a valve seat formed in said body member and surrounding said inlet passage; and a valve member mounted for reciprocation in said cylindrical chamber, said valve member including a seating portion adapted to contact said seat to close said gas inlet passage, said seating portion having a surface exposed to gas pressure in said inlet passage acting in a direction to unseat said valve, and a body member having a surface adapted to be exposed to said gas pressure when said valve member is unseated, the area of said body member surface being substantially greater than the area of said seating portion surface, whereby the pressure differential existing between the inlet and outlet sides of said valve required to unseat said valve member is substantially greater than the pressure differential required to maintain said valve member in the open position, the body member of said valve having a flange with a cylindrical skirt member depending from the periphery thereof, said skirt member having a port therein and cooperating with said cylindrical chamber walls to confine gas under pressure within said cylindrical chamber during substantial movement of said valve member from said seat, whereupon, upon further movement of said valve member, communication between said chambers is established through said port.

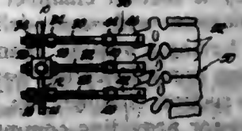
2,774,347
**APPARATUS FOR PRODUCING ARTIFICIAL RESPIRATION**
John H. Emerson, Arlington, Mass.
Application March 17, 1954, Serial No. 416,858
24 Claims. (Cl. 128—30)

1. Apparatus for producing artificial respiration comprising a substantially air-tight respirator casing to receive and enclose at least part of the user's chest but with his head exposed to the atmosphere, a source of negative pressure, a negative pressure conduit having one end communicating with said negative pressure source and the other end communicating with the interior of the casing, an atmospheric conduit providing communication between the interior of the casing and the atmosphere, a valve in the atmospheric conduit movable to open and closed position and which, when in open position, admits gas from the atmosphere through the atmospheric conduit to the casing to assist the user's exhalation and substantially to neutralize the negative pressure created in the casing by said source of negative pressure during each period of inhalation, electrically operated means to actuate said valve, a pneumatically operated switch for controlling said electrically operated means, a transfer conduit providing communication between said pneumatically operated switch and the interior of the casing, and a check valve in said conduit which is moved to open position by negative pressure in the transfer conduit and to closed position by at least substantially atmospheric pressure in the conduit whereby said switch is moved in one direction by negative pressure in said transfer circuit by said means for continuously creating negative pressure.



2,774,348
**ARTIFICIAL RESPIRATOR**
John H. Emerson, Arlington, Mass.
Application May 31, 1952, Serial No. 290,856
23 Claims. (Cl. 128—30)

20. A valve apparatus for cyclically producing alternating negative and positive or atmospheric pressures in apparatus for treating users comprising, delivery conduit means, a source of positive or atmospheric pressure, a source of negative pressure less than the pressure of the surrounding atmosphere, a conduit system affording communication between said negative and positive or atmospheric sources of pressure and said delivery conduit means, valve means in said conduit system to alternately afford operative communication between said delivery conduit means and said positive or atmospheric pressure source and between said delivery conduit means and said negative pressure source, whereby said pressures are alternately delivered to said delivery conduit means, pneumatic means responsive to initiation of each inhalation by the user for operating said valve means without further effort on the part of the user through a time cycle comprising two alternating periods, during one of which periods said valve means is actuated to provide operative communication between said delivery conduit means and said source of positive or atmospheric pressure and during the other of said periods said valve means is actuated to provide operative communication between said delivery conduit means and said source of negative pressure.



2,774,349
**BED WITH LUMBAR TRACTION APPARATUS**
Bernard Davis Judovich, Philadelphia, Pa.
Application November 12, 1954, Serial No. 468,222
1 Claim. (Cl. 128—71)

A bed wherein a patient is treated for lesion of the spine comprising a frame supported by legs at the head and foot end, said frame having means thereon for elevation of the head and foot portion, a fixed half-section secured upon the upper surface of said frame adjacent the head end thereof and being adapted to support the upper segment of a person's body, and a mobile half section borne upon the upper surface of said frame adjacent the foot end thereof and being adapted to support the lower segment of a person's body, said mobile half-section having a plurality of rollers, each rotatably supported about a horizontal axis and riding upon a track on the upper surface of said frame, and a plurality of guide wheels each rotatably supported about a vertical axis upon the lower portion of said mobile half-section, said guide wheels being positioned against vertical guide rails on said frame whereby said mobile half-section is adapted to move rectilinearly between said fixed half-section and the foot end of the bed, means for applying a counter traction force to the upper segment of a person's body, said counter traction force means having straps affixed to the head end of the bed and a harness for embracing a person's chest, and means for applying a traction force to the lower segment of a person's body, said last mentioned means comprising a pelvic harness for embracing the lower trunk of a person's body, said pelvic harness being secured to a longitudinally oscillating bracket secured to the foot end of the bed whereby maximum intermittent traction may be directly applied to the region of the person's body overlying the area between said fixed and mobile half-sections.

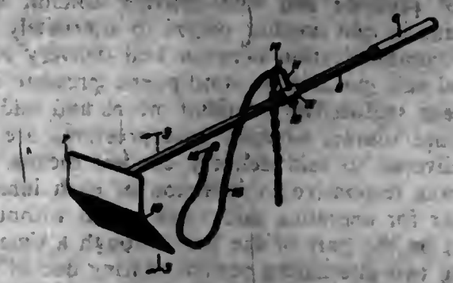
2,774,350
**SPINAL CLAMP OR SPLINT**
Carl S. Cleveland, Jr., Kansas City, Mo.
Application September 8, 1952, Serial No. 308,337
4 Claims. (Cl. 128—92)

1. A spinal brace comprising a pair of spaced, parallel, elongated guide rods; three spaced, parallel, elongated cross-heads having their longitudinal axes in substantially coplanar relationship; means shiftably mounting each of the outermost pair of said cross-heads respectively on the guide rods for reciprocation toward and away from each other along the longitudinal axes of the guide rods with the longitudinal axes of the cross-heads perpendicular to the longitudinal axes of the guide rods; means releasably holding said pair of cross-heads upon the guide rods to maintain a predetermined relative positioning between said pair of cross-heads and to hold the guide rods in spaced parallelism; means rigid to each guide rod respectively, shiftably mounting the remaining cross-head on the guide rods between said pair of cross-heads for reciprocation along and rotation about its longitudinal axis with the longitudinal axis of the remaining cross-head perpendicular to the longitudinal axes of the guide rods; an elongated member for each cross-head respectively; means mounting each member on a corresponding cross-head between said guide rods in perpendicularly extending relationship to its cross-head for reciprocation of the member along and rotation about its longitudinal axis; and structure on each member respectively for releasably holding the spinous process of a vertebra.

2,774,351
**FLAME ARRESTORS FOR ANAESTHETIC EQUIPMENT**
Howard M. Wiles, Waukesha, Wis.
Application April 18, 1955, Serial No. 501,925
2 Claims. (Cl. 128—188)

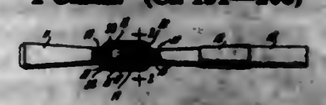
1. A flame arrester for anaesthetic equipment comprising a tubular shell, multi-apertured end couplings thereon, a wafer valve on the plural apertures of one coupling element, and a plurality of segmented alternated plates adapted to pass gas in radial directions therethrough.

2,774,352
**BREATHING ASSISTOR VALVE**
John H. Emerson, Arlington, Mass.
Application March 28, 1952, Serial No. 279,105
5 Claims. (Cl. 128—203)



1. A breathing assistor valve for providing positive pressure substantially throughout each period of inhalation of a user comprising a delivery chamber having a delivery port, means for operably connecting said de-

livery port with an airway to the user's lungs, a positive pressure gas inlet port adapted to provide communication with a source of gas under positive pressure, a closure member for said positive pressure gas inlet port, a conduit providing communication between the positive pressure gas inlet port and the delivery chamber, said conduit being defined in part by a suction chamber which is in continuous communication with said delivery chamber, a control chamber having a suction chamber passage continuously providing communication between the control chamber and the suction chamber, an atmospheric pressure gas inlet port for providing communication between the suction chamber and a source of gas under atmospheric pressure, a check valve for said atmospheric pressure gas inlet port adapted to open in response to reduced pressure of a predetermined amount in the control chamber, said conduit being also defined in part by means for aspirating gas out of said control chamber through said suction chamber passage and into said suction chamber in response to the flow of gas from said souce of gas under positive pressure through said gas inlet port and said conduit and consequently through said aspirating means and suction chamber, said aspirating means being defined in part by said suction chamber, means for normally urging said closure member into a substantially closed position, means, responsive to the negative pressure transmitted through said delivery chamber, suction chamber and suction chamber passage to said control chamber upon the initiation of each inhalation by the user, to open said closure member and initiate a substantial flow of gas



through said conduit and aspirating means, said pressure responsive means being also responsive to the negative pressure created in said control chamber by the aspiration of gas therefrom by said aspirating means in response to said initiated flow of gas through said conduit and said aspirating means, to further open said closure member and increase the flow of gas through said conduit and the pressure in said delivery chamber sufficiently to automatically complete said inhalation with no further effort on the part of the user, said pressure responsive means also being responsive to pressure in said control chamber created by the resistance of the user's lungs to further flow of gas thereinto to automatically close said closure member and means effective during at least a part of the time that said closure member is closed for relieving positive pressure in said conduit and delivery chamber, whereby when the closure member for the positive pressure inlet port is opened responsive to negative pressure created in the control chamber through the delivery chamber, suction chamber and suction chamber passage by a slight inspiratory effort of the user gas flows under positive pressure through said conduit and consequently through said aspirating means and said suction chamber and the aspirating action of said aspirating means in response to said flow of said gas therethrough draws gas from the control chamber though said suction chamber passage into the suction chamber further reducing the pressure in the control chamber and further opening the closure member for the positive pressure gas inlet port, thereby producing positive pressure at said delivery port.

2,774,353
**CALF DELIVERING INSTRUMENT**
Harvey L. Quist, St. Croix Falls, Wis.
Application April 14, 1955, Serial No. 501,354
3 Claims. (Cl. 128—352)

1. A calf delivering instrument of the character described comprising: a lever, a handle on one end of said lever, a bearing plate on the other end of the lever, an arm mounted for sliding and rotary adjustment on the lever, a hook on the outer end of said arm, and a chain, for connection with a calf to be delivered, adjustably engaged with said hook.

2,774,354
**CHLOROPHYL IMPREGNATED FILTER MEANS FOR TOBACCO PRODUCTS**
Irving Florman, New York, N. Y.
Application May 21, 1952, Serial No. 289,123
1 Claim. (Cl. 131—206)

A filter for the insertion in a smoker's article comprising a lengthy strip of absorbent fibrous material having opposite longitudinal edges and with a plurality of parallel and equally spaced incisions extending in cross-wise direction of said filter strip to thereby increase the effectiveness of the absorbent surface of said strip, said incisions extending from one of said longitudinal edges of said strip toward and terminating short of the opposite longitudinal edge of said strip, said strip being deformable to thereby expose the incised edge thereof in the direction from which the smoke is to be first received, said fibrous material consisting essentially of compressed asbestos fibers impregnated with a deodorizing agent in the form of menthol flavored chlorophyl compound.

2,774,355
**PERMANENT HAIR WAVING NEUTRALIZATION BY MONOPERSULFATE**
Thomas E. Bell, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application March 23, 1955, Serial No. 496,335
3 Claims. (Cl. 132—7)

1. The process of restoring disulfide linkages to hair in which the linkages have been disrupted by reduction comprising treating said hair with an aqueous solution containing between about 500 and 2000 p. p. m. of active oxygen bound in the form of the monopersulfate of an alkali metal, said treatment being carried out at a pH of about 2–3 and a temperature of about 20–40° C. for not more than about 5 minutes.

2,774,356
**HAIR DRESS HAIRCUT**
Irving Del D'Lowe, New York, N. Y.
Application June 24, 1954, Serial No. 438,966
3 Claims. (Cl. 132—7)

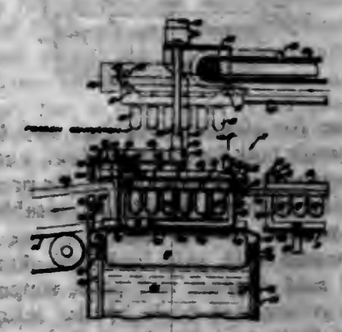
1. A method of simultaneously cutting and setting hair which consists of cutting, shortening, thinning and

shaping the hair to the contour of the head whereby to provide the basic haircut of the hair, forming and securing moist ringlets of the hair on one side of the head and positioning a heat device to direct heat upon the ringlets to set them, and while heating the ringlets on the one side of the head, forming and securing moist ringlets on the other side of the head and then positioning the heat device to direct heat upon these ringlets and while heating these ringlets on the other side of the head, combing out the ringlets on the one side of the head and finish cutting the hair on the one side and thereafter removing the heat device from the other side of the head and combing out the ringlets and finish cutting and shaping the hair on the other side of the head.

2,774,357
**DEVICE FOR DYEING HUMAN HAIR**
Jacob Glitin, New York, N. Y.
Application May 17, 1954, Serial No. 430,158
17 Claims. (Cl. 132—9)

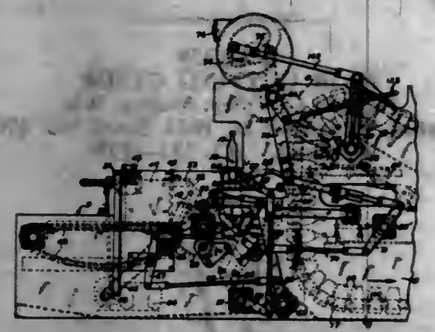
1. A device for treating the hair with an agent while protecting the scalp from contact therewith, comprising a pack of parallel leaves of absorbent material loosely joined together, each leaf having a lower scalp-contacting edge treated with a waterproofing substance both on the edge and on the sides of the leaf immediately thereadjacent and said lower edges being recessed so that the pack will snugly fit the contour of the scalp; a frame to support the pack; connecting means for supporting the leaves in the frame; and clamp means on the frame for compressing the leaves together to bring the hair into contact therewith.

2,774,358
**HAIR TREATING DEVICE**
Alexis Zachary, New York, N. Y.
Application December 4, 1951, Serial No. 259,785
3 Claims. (Cl. 132—34)



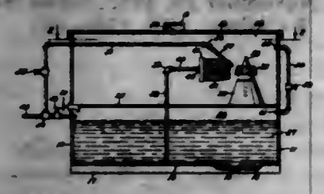
1. A hair treating device comprising a hollow bar having one end closed, a head slidably mounted on the bar adjacent said end, a stem affixed to the head and extending along said bar towards the other end thereof, said stem tapering in thickness transversely of said bar, and a spring in said bar seated against said closed end for holding said head with the outer extremity of said stem adjacent said other end of the bar, said stem being thinnest at said extremity, said bar having longitudinal ribs on its outer surface, one of said ribs having a groove open to the interior of the bar, said stem having a projection slidably disposed in said groove abutting the spring.

2,774,359
**HAIR CUTTING GUIDE**
Richard G. Foley, Mellen, Wis.
Application November 22, 1954, Serial No. 470,334
4 Claims. (Cl. 132—129)



1. A hair cutting guide comprising a head-contacting member conforming to the contour of the head of a person, and a row of teeth carried by said member in spaced-apart parallel relation to each other and positioned laterally with respect to the member and adapted for placing under the hair to hold the same outwardly from the head, said row of teeth including a stationary group of teeth and a movable group of teeth movable inwardly and outwardly relative to the head and both groups of teeth being arranged in a continuous row, and said stationary group of teeth being of gradually decreased diameter in a direction away from the movable teeth.

2,774,360
**AUTOMATIC MOLD DEFROSTER**
Max Hughes, West Sacramento, Calif.
Application November 30, 1953, Serial No. 394,938
8 Claims. (Cl. 134—46)



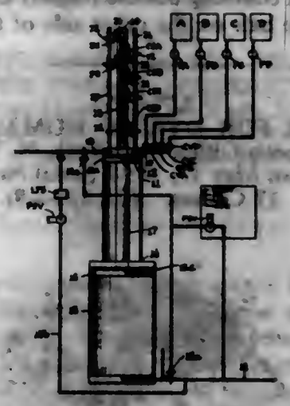
1. A mold defroster comprising a vertically acting plunger, a mold carrier on said plunger including a pair of arms engageable on the upper sides thereof with a frozen confection stick holder and on the lower sides thereof with a frozen confection mold, a defrosting tank disposed below said mold carrier, means for lowering said plunger and said mold carrier whereby said stick holder and said mold are immersed in said defrosting tank for a predetermined length of time, means for raising said plunger and said mold carrier whereby said stick holder is elevated to a predetermined vertical position, and a conveyor disposed substantially at said predetermined vertical position for disengagement of said stick holder from said mold carrier.

2,774,361
BOTTLE WASHER
Archie E. Ladewig, Waukesha, Wis., assignor to Archie Ladewig Co., Waukesha, Wis., a corporation of Wisconsin
Application March 7, 1955, Serial No. 492,501
16 Claims. (Cl. 134—74)

1. In a bottle washer, a casing having therein means for dividing the casing into a lower chemical solution bottle soaking basin and a succession of upper chemical solution and fresh water bottle washing zones segregated from said basin, a conveyor for transporting bottles successively in upright position while immersed within chemical solution through said lower basin and in inverted position while subjected to washing sprays through said upper zones, means for heating the chemical solution in said basin, means for circulating a portion of the hot chemical solution from said basin directly through said chemical solution bottle washing zone, and means for pre-heating the water delivered to said fresh water bottle washing zone with another portion of the hot chemical solution passing through said circulating means.

2,774,362
DEVICE FOR WASHING AND DRYING BEARINGS AND THE LIKE
James R. Nordling, Portland, Oreg.
Application November 8, 1952, Serial No. 319,453
4 Claims. (Cl. 134—99)

1. A device for cleaning bearings and the like comprising a reservoir tank for cleaning fluid, a compressed air supply pipe connected with said tank for pressurizing said fluid, a washing chamber having a rotatable support for parts to be washed, nozzle means at one side of said support connected with said tank and directed tangentially toward said support and parts supported thereby to wash and rotate said parts by the action of jets of cleaning fluid from said nozzle means, and a nozzle at one side of said support connected with said air supply pipe and directed tangentially toward said support and parts supported thereby to dry and rotate said parts by the action of an air jet from said nozzle.

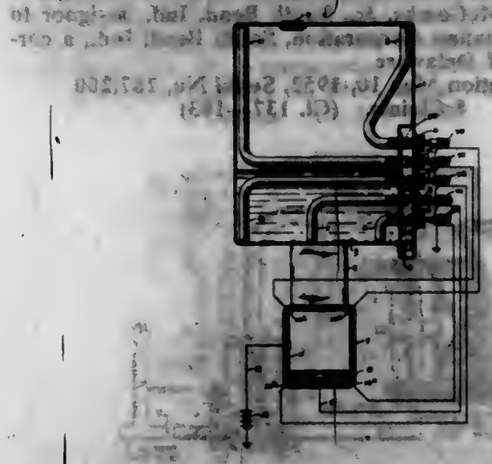


2,774,363
VALVE OPERATION
Fritz Emil Paul Bezzies, South Orange, N. J., assignor to Colgate-Palmolive Company, a corporation of Delaware
Application February 28, 1952, Serial No. 273,982
9 Claims. (Cl. 137—1)

6. The method of maintaining a rotatable plug valve against freezing due to crystallization or caking of line fluid during periods when the valve is closed which comprises introducing into the space between the seating surfaces of the plug and valve body a solvent liquid for

crystallized or caked line fluid material under sufficient substantially constant pressure for continuously seeping said solvent liquid through said space for maintaining said surfaces constantly moistened.

2,774,364
PROPORTIONING AND DISPENSING MEANS
Carl K. Brobeil, Oxford, Conn.; Olga S. Brobeil, administratrix of said Carl K. Brobeil, deceased
Application March 17, 1954, Serial No. 416,796
19 Claims. (Cl. 137—3)



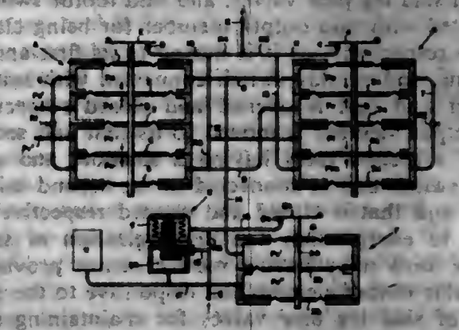
1. An apparatus for proportioning and dispensing fluid materials comprising a plurality of supply stations for the materials; feed means connected to each of the stations to feed material therefrom to a common vessel; means selectively controlling the starting and stopping of each of the feed means in accordance with the predetermined volume of material fed into the vessel; and emptying means feeding the mixed materials from the vessel to a receiver therefor.

2,774,365
WITHDRAWAL OR VENTING SYSTEM FOR TANKS CONTAINING LIQUIDS
Ronald Bryson Stewart, York Township, York County, Ontario, and Ronald Greville Dennys, Brampton, Ontario, Canada, assignors to A. V. Roe Canada Limited, Peel, Ontario, Canada, a corporation
Application May 26, 1954, Serial No. 431,247
7 Claims. (Cl. 137—44)

1. In combination, a first tank containing liquid and having a plurality of outlets at different locations in the tank, valves controlling the outlets, each valve having an outlet opening position and an outlet closing position, a second tank similar to and in fixed relationship to the first tank, a plurality of electrical terminals in the second tank and insulated therefrom, the terminals corresponding in position to the outlets in the first tank, an electrically conductive liquid partially filling the second tank the conductive liquid contacting different terminals at different positions of the second tank, means imparting an electrical potential to the conductive liquid whereby a terminal contacted by the conductive liquid assumes the potential of the conductive liquid, and a control for each valve, each valve control including an electrical device, different ones of the electrical devices

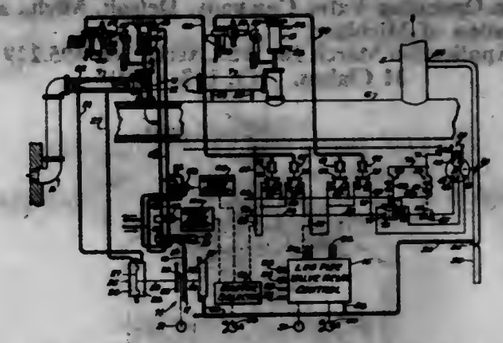
being connected to different ones of the terminals, each valve control being operable to change the position of

its valve when the terminal to which its electrical device is connected assumes said potential.



2,774,366
TEMPERATURE-RESPONSIVE CHECK VALVE
John R. Dado, Whiting, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application September 24, 1954, Serial No. 458,053
3 Claims. (Cl. 137—75)

1. An excess temperature shutoff valve for use on an impulse line for direct pressure-operated control valves which comprises in combination a generally cylindrical casing, conduit engaging means at opposite ends of said casing, a ribbed sleeve slidably positioned within said casing, a ball check within said casing, a plurality of low melting restraining pins carried by the downstream ends of the ribs of said sleeve and restraining said ball check within said sleeve under normal operating temperature conditions, fluid flow channels in said sleeve permitting flow about said ball check when restrained by said pins, a valve port adjacent the downstream end of said casing below said sleeve and adapted to be closed by said ball check to prevent flow through said casing when said restraining pins are deformed by hot fluids passing successively through said flow channels and through said valve port in said casing, and coupling means external of said casing for retaining said sleeve within said casing.



2,774,367
AIR-OPERATED CONTROLLER HAVING MANUALLY ADJUSTABLE RESTRICTIONS GIVING INTEGRAL OR RESET, DIFFERENTIAL OR RATE, AND PROPORTIONAL BAND-ADJUSTMENT MODES OF OPERATION
Edward C. Gregan, Philadelphia, Pa., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application August 7, 1952, Serial No. 303,070
23 Claims. (Cl. 137—86)

1. An elastic-fluid-pressure-actuated controller, including, means to derive a process variable force proportional to the deviation of a process variable from a predetermined value, means responsive to said process variable force to create a second force containing a component proportional to said process variable, means responsive to said second force to create a third force containing a component proportional to said process variable plus the derivative of said deviation with respect to time, means to oppose said second force and said third force to each other to create a fourth force proportional to said derivative of said deviation with respect

to time, means to integrate said fourth force proportional to the derivative of said deviation with respect to time so as to create a fifth force proportional to said deviation, and means to oppose said process variable force and said fifth force to said third force to produce an output force which is the resultant of said forces.

2,774,368
BLAST FURNACE WIND DISTRIBUTION CONTROL
Sam H. Jones, Flossmoor, Ill., assignor to Askania Regulator Company, Chicago, Ill., a corporation of Illinois
Application September 10, 1954, Serial No. 455,257
9 Claims. (Cl. 137—100)

6. A system for maintaining selected ratios of volume rate of flow of blast air to multiple tuyeres of a blast furnace through plural leg pipes individually supplying the tuyeres from a common blast main and each of which leg pipes has a valve that is adjustable to vary rate of air flow through it and a relay arranged for adjusting that valve to more open and closed conditions respectively in response to decrease and increase in that flow rate; said system comprising a bleeder line in communication with said blast main for discharging a pilot flow of air, means for measuring the volume flow rate of said pilot flow, developing a master signal proportional to that rate and applying said signal to all of said leg pipe valve-controlling relays in a sense to adjust said leg pipe valves toward more open and closed conditions respectively in response to preselected opposite senses of variation of said pilot flow and master signal, a bleeder valve in said bleeder line that is adjustable to vary said pilot flow volume rate and said master signal, an electric motor operatively connected with said bleeder valve for adjusting it toward more open and more closed positions respectively by running in opposite directions and a pair of motor circuits respectively closable for operating the motor in opposite directions and maintaining said motor stopped while both are open, a first motor-control relay having motive means having a movable output member and actuable in response to all said leg pipe valves to move that member to a first position when all said leg

pipe valves are closed to positions corresponding to a preselected degree and to a second position when one of said leg pipe valves is open to that degree, a first motor switch connected in the one of said motor circuits that is closable to operate the motor in the direction to adjust said leg pipe valve and vary said master signal in senses to open said leg pipe valves, and said motor switch being connected with said output member for being closed and opened respectively as it is moved to its first and second positions, and a relay switch connected with said output member and that is opened and closed respectively as said output member is moved to its first and second positions, a second relay having a solenoid and a second motor switch that is connected in the second said motor circuit and that is closed and opened respectively in response to energization and deenergization of said solenoid, a third relay having motive means provided with a movable output element and responsive to the positions of all of said leg pipe valves for maintaining said element in a first position while all of said leg pipe valves are more closed than a preselected limit condition more widely open than said preselected degree and to move said element to a second position when any leg pipe valve is opened to said limit condition, a second relay switch operable by said output element and opened and closed respectively in the first and second positions thereof, and a circuit for energizing said solenoid and including said first and second switches in series connection.

---

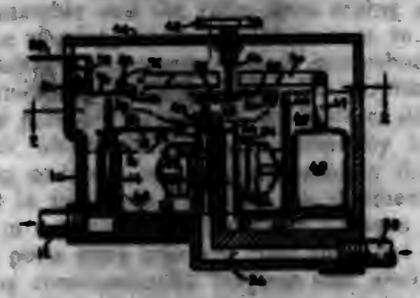
2,774,369
VALVE
Dominic A. Di Tirro, Royal Oak, Mich., assignor to Ross Operating Valve Company, Detroit, Mich., a corporation of Michigan
Application March 18, 1955, Serial No. 495,229
31 Claims. (Cl. 137—102)

14. In a device of the class described, a housing having a pair of ports for connection to separate sources of intermittent fluid pressure, a chamber in said housing, a port leading from said chamber for connection to a device to be actuated by said intermittent pressure sources, a pair of vent passages in said housing, a pair of oppositely disposed piston operated vent valves between said chamber and said vent passages, resilient means normally holding said valves in closed position, passages in said valves leading from the chambers formed by the valve pistons to said first-mentioned chamber, said valve piston chambers being connected to said first-mentioned ports, a pair of elements disposed within said last-mentioned passages, said elements each being movable between a normally open position permitting fluid flow in either direction in said passage and a position closing said passage, the passage of fluid from said valve piston chambers toward said first-mentioned chamber urging said elements toward their closed positions, and means interconnecting said elements so as to hold the elements simultaneously in their open positions when the forces on said elements are substantially equal, a differential in said forces causing one of said elements to move into its closed position, whereby continued fluid pressure from its corresponding first-mentioned port will cause the corresponding vent valve to move into its open position.

2,774,370
MAKE-AND-BREAK DEVICE FOR PERIODIC OR CYCLIC APPLICATION OF FLUID PRESSURE
Howard L. McCombs, Jr., South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application May 16, 1952, Serial No. 287,200
8 Claims. (Cl. 137—103)

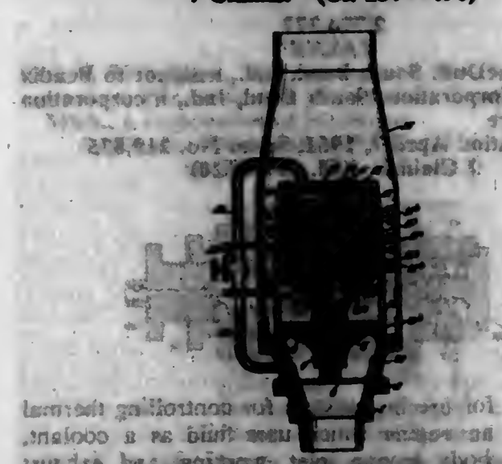
1. A device adapted to be interposed in a fluid pressure or suction conduit between a source of pressure and a point of applied pressure for producing fluid pressure pulsations at said point, comprising a housing, a flexible wall in said housing dividing the interior thereof into first and second chambers, a passageway connecting said first chamber with said conduit, a port in said housing formed to connect said first chamber with a source of higher pressure, means for connecting said second chamber with said conduit posterior said first chamber, a valve in said housing adapted to control the communication between said port and said passageway, the effective area of said valve exposed to conduit pressure being less than that of said flexible wall, and means operatively connecting said wall and said valve.

---



2,774,371
SLUICE VALVE
Allan Grassmann, Stockholm, Sweden
Application July 3, 1952, Serial No. 297,124
Claims priority, application Sweden July 10, 1951
1 Claim. (Cl. 137—243)

Sluice valve to be used in pulp lines, comprising a case having a flow passage extending therethrough, a disc movable in an opening in said case intersecting said flow passage, two sharp-edged ledges arranged inside said valve case bordering said opening, one at each side of said disc providing a seal between said disc and said case, said ledges starting from diametrically opposite sides of said flow passage and extending beyond each other only a short distance at the bottom of the case, the bottom end of said disc having a central peripheral groove, so that two acute-angled cutting edges are formed, each cooperating with the sharp edge on the corresponding ledge.



2,774,372
TILTABLE CONTROL VALVE HAVING SAFETY TRIP-OUT
Lourdes W. McCarty, Milwaukee, Wis., assignor, by mesne assignments, to Controls Company of America, Schiller Park, Ill., a corporation of Delaware
Application January 18, 1955, Serial No. 482,576
7 Claims. (Cl. 137—460)

1. A constant level control valve comprising, a casing having an inlet, a valve for the inlet, an annular float in the casing and connected to the valve for regulating the valve action to maintain a constant level in the casing, an outlet from the casing located substantially centrally of the float, a valve for regulating flow through said outlet, a wall defining an overflow chamber in the casing and having sufficient height to preclude flow over the wall, a safety float in the chamber, a striker plate above the inlet valve, means biasing the striker towards the valve to close the valve, means retaining the striker in an inoperative position and connected to the safety float to release the striker when the level in the overflow chamber reaches a predetermined level, and conduit means originating substantially centrally of the annular float and terminating in the chamber, said conduit means originating at an overflow level above said constant level so liquid in the casing will flow through the conduit means into the overflow chamber when the level in the casing reaches the overflow level.

---

2,774,373
SAFETY VALVE, NOTABLY FOR HYDROCARBON RESERVOIRS AND PIPINGS
Henri Fievet, Sens, France, assignor to Societe Technique et Commerciale d'Installations Industrielles Lacoste, Sens (Yonne), France
Application January 24, 1955, Serial No. 483,583
Claims priority, application France January 30, 1954
7 Claims. (Cl. 137—490)

1. A safety valve disposed between two rooms each of which contains a gaseous fluid under pressure, comprising, in combination, a valve assembly having a substantially tubular valve-body secured on the wall separating the rooms and formed with a valve-seat facing a first room, a valve member part of which faces the second room, a spring applying said valve member against said valve-seat as long as the fluid pressure in said first room remains between two predetermined limits, a cylinder with a closed end secured on said valve-body and located within the second room, a hollow differential piston having a head end and an open end and being slidably mounted in said cylinder to define a chamber therewith and secured on the part of said valve member facing said second room, said hollow piston defining an inner cavity, means for separating the inner cavity of said hollow piston from the second room, means for connecting said inner cavity to said first room, pressure responsive means for connecting said chamber to said cavity in response to the fluid pressure in the first room attaining the upper limit whereby the valve assembly is instantaneously opened, pressure responsive means for connecting said chamber exclusively to the second room in response to the falling of the fluid pressure in the first room under said upper limit whereby the valve assembly is instantaneously closed, and means for opening the valve assembly in response to the fluid pressure in said first room falling under the lower limit, said piston being formed with ducts respectively connecting its inner cavity to the first and second rooms, said piston being formed with an orifice through its head end, the pressure responsive means for connecting the chamber to said cavity comprising a needle valve housed in said piston and closing said orifice, a deformable bellows housed in said piston, operatively connected to said needle valve, and having its outer face submitted to the fluid pressure in the first room through the ducts connected to the first room, the inner face of the bellows being submitted to the fluid pressure in the second room through the ducts connected to the second room, means for separating the two spaces defined by said bellows in the piston cavity, and adjustable means for resiliently applying said needle valve against the piston bottom.

---

2,774,374
PULSATION SMOOTHING VALVE
Edgar R. Schneider, Sullivan, Mo.
Application February 21, 1951, Serial No. 212,158
5 Claims. (Cl. 137—505.29)

1. A device that is adapted to receive fuel from the fuel pump of an engine and to direct said fuel toward the mixing jet of the carburetor of said engine while minimizing pulsations in the pressure and flow of said fuel and that comprises a liquid-tight container to receive and confine fuel, an inlet opening for said container, an outlet opening for said container, a valve seat and a movable valve element intermediate said inlet and outlet openings, said movable valve element being movable away from said valve seat to permit fuel to flow from said inlet opening to said outlet opening and being movable toward said valve seat to valve the flow of fuel from said inlet opening to said outlet opening, a fulcrum, a low weight and small mass lever that is movable about said fulcrum to move said movable valve element relative to said valve seat, a pressure-responsive element that is in communication with the interior of said container, a link that is mounted on and carried by said pressure-responsive element and that extends between said pressure-responsive element and said lever and is movable by said pressure-responsive element to move said lever and thereby move said movable valve element toward said valve seat, a spring that biases said pressure-responsive element

and said link for movement to a position that permits said lever and said movable valve element to move away from said valve seat, said spring being yieldable to permit the pressure on fuel in said container to act upon said pressure-responsive element and move said pressure-responsive element and said link and thereby move said lever and said movable valve element toward said valve seat, a lost motion connection between said link and said lever that permits said pressure-responsive element and said link to move toward said position independently of said lever and said movable valve element, and a second spring that acts between said pressure-responsive element and said lever to normally take up the lost motion in said lost motion connection, said link acting upon said lever intermediate said fulcrum and said movable valve element to multiply the movement imparted to said movable element by said lever in response to movement of said pressure-responsive element and said link, the first said spring being at one face of said pressure-responsive element, said second spring being at the opposite face of said pressure-responsive element, said second spring being a helical compression spring, said second spring surrounding and having its axis parallel to said link, the first said spring being a helical compression spring, the first said spring and said second spring have their axes disposed in end to end alignment, the first said spring and the pressure on the fuel in said container maintaining said link and the portion of said pressure-responsive element engaged by said link in a floating position in said container whereby said pressure-responsive element and said link can move quickly when the pressure on said fuel falls, said pressure-responsive element being substantially completely under the control of the pressure on the fuel in said container and of the first said spring, whereby said device can be operated in any position.

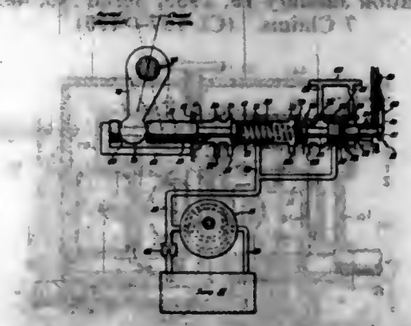
---

**2,774,375**

## AUTOMATIC SHUT-OFF VALVES

Raoul Bernat and Henri Bernat, Bordeaux, France; said Henri Bernat, sole heir of said Raoul Bernat, deceased

Application April 22, 1953, Serial No. 350,448
In France February 19, 1946
Section 1, Public Law 690, August 8, 1946
Patent expires February 19, 1966
3 Claims. (Cl. 137—516.19)



1. A valve arrangement comprising, in combination, a valve member having valve openings arranged in an annular row therein opening in a face of said valve member and having on said face valve seat means about said valve openings; a plurality of spaced permanent magnet means arranged in said valve member both within and outside of said annular row of valve openings with poles thereof located in the region of said valve seat means so as to form in the region of said valve seat means a plurality of independent points of magnetic attraction along said valve openings; a thin laminar annular magnetizable valve closure member arranged on said valve seat means attracted to the same by said spaced permanent magnet means at a plurality of points of magnetic attraction so as to be seated thereon, but movable away from said valve seat means against action of said permanent magnet means by pressure of fluid passing through said valve opening means, said annular magnetizable valve closure member at least partially overlying the permanent magnet means both within and outside of said annular row of valve openings; and stop means limiting movement of said magnetizable valve closure member away from said valve seat means.

**2,774,376**

## TRANSMISSION CONTROL

Richard E. Young, Muncie, Ind., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois

Application May 24, 1951, Serial No. 228,038
2 Claims. (Cl. 137—620)

1. In a fluid pressure regulating system the combination of a manually positionable control lever depressible from one limit position toward another, a spring for returning the lever to its said one limit position upon the manual release of the lever, a source of fluid pressure, fluid pressure control means connected with said source and including a first valve and a second valve resiliently connected with the first valve, linkage positively connecting said first valve and said control lever and including a pivotal member having a rounded portion that fits into a slot in the first valve so that movement of the control lever pivots the pivotal member and moves the first valve longitudinally, said first valve functioning upon depression of the control lever to bias the second valve away from a retracted position, a land on said second valve and one side of the land being effective for metering the fluid pressure supplied by said source and supplying a fluid pressure substantially proportional to the degree of displacement of the second valve from its retracted position, and means for applying the last-mentioned fluid pressure to the opposite side of said land on said second valve to oppose the bias on the second valve by the first valve through the resilient connection, said first valve being returned to a retracted position by the action of said spring upon the manual release of said lever to thereby relieve the bias on the second valve away from its said retracted position and said last-mentioned fluid pressure at this time being effective to urge the second valve toward its said retracted position.

---

**2,774,377**

## VALVE

Stanley I. MacDuff, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware

Application April 7, 1951, Serial No. 219,875
2 Claims. (Cl. 137—620)

1. A valve for use in a system for controlling thermal conditions in an engine which uses fluid as a coolant, comprising a body having inlet, working, and exhaust ports therein, a partition member in the body separating the inlet and working ports from the exhaust port, forming work and exhaust chambers, a portion of said body including a wall which forms work and control chambers, a passage in said partition member communicating the working port and the exhaust port, a valve stem reciprocable in a bore through the portion of the body forming the work and control chambers and extending into said chambers, said valve stem having a passageway therein which communicates the inlet port with the working port, a conical valve seat on said stem on the end extending into said working chamber for controlling the communication between the aforementioned inlet and working ports, a spring operatively associated with the partition member and the valve stem urging said stem toward the control chamber, said passage in the partition including a valve seat adjacent said exhaust chamber, an abutment extending from the partition at the end of the passage leading into the work chamber, said valve seats, abutment, passage, passageway and valve stem being co-lipear, a ball engageable in the conical valve seat in said stem and with the abutment on said partition to establish communication between the inlet and work ports when unseated from the valve seat, and establishing communication between said work and exhaust ports when seated in the valve seat on the stem and in contact with the abutment, a second ball engageable with the valve seat in the partition member and operative to control communication between the work and exhaust port when the first mentioned ball engages said abutment, a spring in said exhaust chamber urging said second ball to a seated position in its cooperating valve seat, said spring being of a greater strength than the first mentioned spring, a reciprocable pin in the passage of the partition and having a greater length than said passage, said pin being in contact with each of the aforementioned ball members and operative to unseat the second ball from its valve seat, permitting communication between the working and exhaust ports when sufficient force is exerted on the stem in the control chamber, overcoming the spring force in the exhaust chamber, and when the first mentioned ball is seated on the abutment, the end of the passage opposite to that containing the valve seat for the second ball including radial grooves adjacent the abutment permitting the aforementioned communication between the working and exhaust ports when the pin unseats the second ball due to force on the stem in the control chamber, and an adjustable pressure responsive means contained in said control chamber in engagement with the end of the stem extending into the control chamber, said last mentioned means operative to control communication between the inlet and work ports or the work and exhaust ports depending on preset conditions of said last mentioned means.

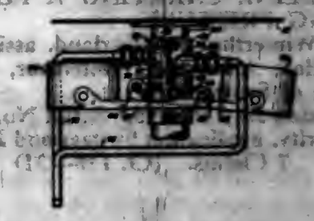
**2,774,378**

## VALVE

Earl F. Mekelburg, Wauwatosa, and Carl B. Sohns, Milwaukee, Wis., assignors to Square D Company, Detroit, Mich., a corporation of Michigan

Application March 10, 1951, Serial No. 214,962
13 Claims. (Cl. 137—623)

1. In an electrically operated device for controlling the flow of pressurized fluid, a valve body having a plurality of passages therein through which said fluid passes, means within said valve body for directing the flow of fluid through said passages, means biasing said directing means toward one position, and electromagnetic means including an armature and core for controlling the position of said directing means, said armature having a connection to said directing means which decreases in mechanical advantage as said armature approaches said core whereby the shock associated with closing of said armature upon said core is minimized.



---

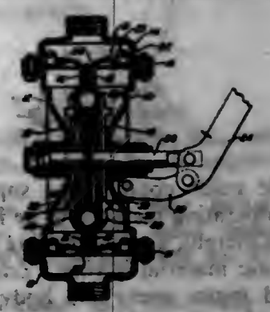
**2,774,379**

## DUAL VALVE FOR CONTROLLING LIQUID LEVEL

Morgan L. Sweeney, Jr., Los Angeles, Calif., assignor to The Parker Appliance Company, Cleveland, Ohio, a corporation of Ohio

Application May 24, 1950, Serial No. 163,919
8 Claims. (Cl. 137—637)

8. A fluid flow control device comprising a casing having a main fluid passage therethrough, said passage including a valve chamber and inlet and outlet ports at opposite sides of said valve chamber, said ports being in axial alignment with each other, a pair of oppositely acting fluid pressure operated inlet and outlet valves within said chamber, the inlet valve controlling the flow of fluid from the inlet port to the valve chamber and the outlet valve controlling the flow of fluid from the valve chamber to the outlet port, a pressure chamber associated with each of said valves, a bypass duct leading from each pressure chamber and other ducts for conducting fluid from said passage to each of said pressure chambers the inlet valve having an area exposed to fluid in the inlet port for opening the inlet valve when the pressure of fluid in the inlet is greater than the pressure of fluid in the respective pressure chamber, the outlet valve having an area exposed to fluid in the valve chamber for opening the outlet valve when the pressure of the fluid in the valve chamber is greater than the pressure of fluid in the respective pressure chamber, and a pilot valve associated with each bypass duct for controlling discharge of fluid from the pressure chambers.



---

**2,774,380**

## DIAPHRAGM ANNULUS WITH A SPRING THEREIN

William L. Hudson and Harold Lee, Fort Wayne, Ind., assignors to Tokheim Corporation, a corporation of Indiana

Application April 28, 1952, Serial No. 284,722
7 Claims. (Cl. 137—793)

1. A pump diaphragm assembly, comprising a working annulus extending between an outer peripheral rim and a central piston adapted to be reciprocated axially with respect to the rim, said annulus comprising opposite outwardly convex walls of flexible material defining a space of substantially circular cross-section, and an endless helical spring ring within said space and of smaller cross-section than said space and said spring being substantially

incompressible across its section, extending circumferentially around said annulus between said annulus walls and the turns of said spring being spaced from each other and contacting each wall in a substantially circular series of points so that said ring will stretch and contract along its helical axis and will provide mutual support between the walls during reciprocation of said piston relative to said rim.

---

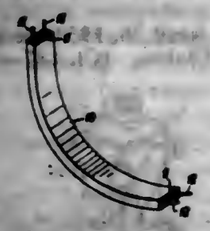
2,774,381

**DEVICE FOR REDUCING PRESSURE INCREMENTS IN A PIPELINE CARRYING A FLUID UNDER PULSATING PRESSURE**

Alfred Burl, Winterthur, Switzerland, assignor to Sulzer Freres, Societe Anonyme, Winterthur, Switzerland, a corporation of Switzerland

Application July 16, 1953, Serial No. 367,336
Claims priority, application Switzerland July 12, 1952
7 Claims. (Cl. 138—31)

1. A device for reducing pressure increments in a conduit carrying a fluid under pulsating pressure, comprising, in combination, a vapor cushion chamber, means for producing a vapor cushion within said chamber, a hollow cylinder connecting said chamber with the conduit, a piston adapted to reciprocate within said cylinder, means affording a restricted fluid communication between the conduit and said vapor cushion chamber, and means connected with said piston for supplying forces adapted to freely floatingly retain said piston in middle position within said cylinder.



---

2,774,382

**GUIDING CONDUIT**

James Sydney Bentley, London, England, assignor to Teleflex Incorporated, Wilmington, Del., a company of Delaware

Application June 12, 1953, Serial No. 361,377
5 Claims. (Cl. 138—56)

1. A flexible guide conduit and support for an elongated flexible operating member to be housed therein and shifted relative thereto, and comprising an elongated body of flexible plastic material having a cross section presenting major and minor axes, said body having extending longitudinally therethrough a bore which is relatively small as compared to the cross section of the body along its major axis whereby to leave a substantial amount of material along the major axis of the body outside of the bore to add stiffness to the body for supporting the flexible operating member within the said bore, and an elongated reinforcing element embedded in the plastic body and extending longitudinally and substantially from end to end thereof and disposed between the bore and a narrow edge of the body for resisting stretching or collapsing of the body, the material of the body along the major axis thereof being resistant to bending therealong but facilitating bending of the body along the minor axis thereof and twisting of the body along its longitudinal axis to enable the conduit to negotiate curved installations.

---

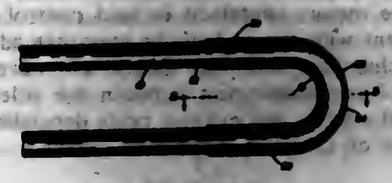
2,774,383

**INSULATION FOR UNDERGROUND CONDUITS AND METHOD OF PRODUCING THE SAME**

Alexander C. Kidd, South Orange, N. J., assignor to Insul-Fil Co., Inc., New York, N. Y., a corporation of New Jersey

Application June 3, 1955, Serial No. 512,953
8 Claims. (Cl. 138—68)

1. The combination of a metal conduit, an inner annular plastic layer of a mixture of about 50% by volume of a hydrocarbon having a high softening point in Fahrenheit degrees of about 280 to 310 and of about 50% by volume of expanded perlite particles coated with a similar high softening point hydrocarbon in contact with and surrounding said conduit, and an outer substantially solidified layer of a sintered mass of said mixture.



---

2,774,384

**HEAT EXCHANGER U-TUBES**

Robert M. Wallace, Massillon, Ohio, assignor to The Griscom-Russell Company, Massillon, Ohio, a corporation of Delaware

Application September 15, 1953, Serial No. 380,236
2 Claims. (Cl. 138—69)

1. Heat exchanger U-tube construction including, a primary metallic tube having a substantially U-bend portion intermediate the ends thereof, the U-bend being formed on a relatively small radius such as to cause thinning of the tube wall at the bend, said primary tube having walls of uniform thickness throughout the unbent portions thereof sufficient to withstand the pressure to which those portions are subjected and a thinner wall at the U-bend portion insufficient in thickness to withstand the pressure to which the parallel portions are subjected, a secondary metallic tube section telescoped over the U-bend portion of said primary tube, the secondary tube having a thinned wall in the U-bend portion thereof, the combined thickness of the thinned walls of the primary and secondary tubes in the U-bend portions thereof providing sufficient metal thickness to withstand the pressure to which the parallel primary tube portions are subjected, the metal constituting the secondary tube section having a smaller coefficient of expansion than the metal constituting the primary tube, the metal constituting the secondary tube section having a greater tensile strength than the metal constituting the primary tube, and the primary tube being expanded into the secondary tube section to bring the interface surfaces of said two tubes into intimate metal-to-metal heat transfer contact.

2,774,385

**VALVE CAP**

Juan Costas Rabassada, Barcelona, Spain

Application July 13, 1954, Serial No. 442,995
3 Claims. (Cl. 138—89.3)

1. A valve cap comprising a cylindrical member provided with a threaded drill hole adapted for engagement with the outer threads of a pneumatic inner tube valve stem and having an end wall opposite the hole, an outer member provided with open ends guided for free rotation over the cylindrical member, a coupling and retaining device operatively connecting said members so that after the cylindrical member has been turned by the outer member to tightly screw the cap onto the valve stem, turning movement of the outer member in the opposite direction is not imparted to the cylindrical member, and means on the end wall of the cylindrical member engageable by a loosening key, so that the cap cannot be unscrewed in the absence of such key, the coupling and retaining device including a piece resiliently connected to one of said members and formed with a sharp end permanently contacting the facing surface in the other member, the material forming said facing surface being softer than the material forming the sharp end, whereby the latter may bite into said surface thus forming notches with which it is engaged operatively for locking the cap.

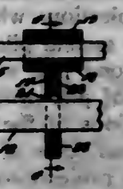
---

2,774,386

**PROFILE ELEMENT FOR HARNESS FRAMES**

Paolo Formenti, Cavalo Bolzanin (Milan), Italy

Application June 27, 1951, Serial No. 233,784
Claims priority, application Italy June 28, 1950
4 Claims. (Cl. 139—91)



1. A profiled element for use in heddle frames comprising a single folded metal sheet provided with an intermediate body, and with opposite T-shaped end pieces, said intermediate body being provided with at least one portion offset with respect to the longitudinal center line passing through the webs of said T-shaped end pieces, said T-shaped end pieces including each two web-forming strip parts substantially parallel to each other and substantially symmetrical with respect to said center line, furthermore two substantially flat flange-forming strip parts extending from said web-forming strip parts in opposed direction to each other and substantially perpendicular to said longitudinal center line, at least one of said T-shaped end pieces being provided with a flat cross-strip part interconnecting said two flange-forming strip parts adjacent the outermost ends thereof, said flange-forming strip parts of said T-shaped end pieces being in height substantially coextensive with said offset portion and extending in planes substantially parallel to each other.

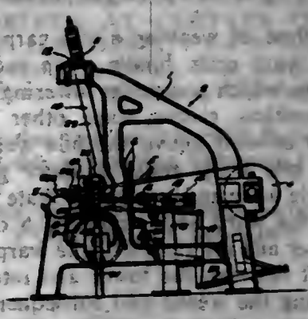
2,774,387

**HEDDLE FRAMES**

Abbott S. Gainher, North Andover, and James T. Trowbaim, Andover, Mass., assignors to Emmons Loom Harness Company, Lawrence, Mass., a corporation of Massachusetts

Application November 17, 1954, Serial No. 469,528
8 Claims. (Cl. 139—92)

1. In a heddle frame for looms having slidable members therein for supporting the heddle bars intermediate their ends, said slidable members being made of moldable plastic material and each comprising a horizontal portion shaped for sidewise movement in the frame, and a vertically extending portion having a recess within which the heddle bar is positioned, and an internal reinforcing member within said vertically extending portion.



---

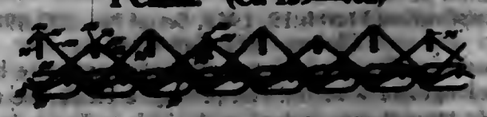
2,774,388

**SHUTTLE CONTROL**

Herman C. Frantzel, Shorewood, Wis.

Application September 3, 1953, Serial No. 378,259
41 Claims. (Cl. 139—126)

1. In a shuttle control for a loom the combination comprising a shuttle box, a shuttle brake having a first brake member and a second brake member frictionally engageable and disengageable with respect to said first brake member adapted to slip with respect to the first brake member when engaged therewith to develop braking friction and cooperatively engageable with a shuttle entering said box to impart braking drag thereto, brake disengaging means responsive to relative position of said braking members, and shuttle homing means having a member movable along said box to move a shuttle therein after braking of the shuttle.



---

2,774,389

**PILE FABRIC**

Frank W. E. Hasselhorth, Carlisle, Pa., assignor to C. H. Masland & Sons, Carlisle, Pa., a corporation of Pennsylvania

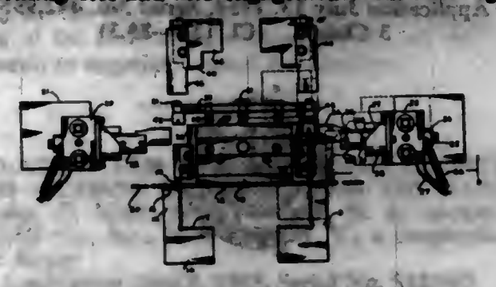
Original application March 3, 1952, Serial No. 274,866, now Patent No. 2,731,988, dated January 24, 1956. Divided and this application June 22, 1953, Serial No. 363,254
1 Claim. (Cl. 139—402)

A velvet pile carpet having a plurality of contrasting pile warp sets, stuffer warp ends, binder warp ends and wefts interwoven together, all of the ends of the pile warp sets being raised in the pile in successive transverse

rows of pile projections in the fabric, the fabric having a plurality of first pile areas distributed in spaced relation, and a plurality of second pile areas distributed in spaced relation, the pile warp ends of the first pile warp set forming in each of the first pile areas, rows of pile projections which extend above the pile projections of the second pile warp set, and forming in the second pile areas rows of pile projections whose tops are below the pile projections of the second pile warp set, and the pile warp ends of the second pile warp set forming in the first pile areas, rows of pile projections whose tops are below the pile projections of the first pile warp set and in the second pile areas rows of pile projections which extend above the pile projections of the first pile warp set, whereby in one pile area the pile projections formed by one pile set have the heights which the pile projections of the other pile warp set have in a different pile area.

---

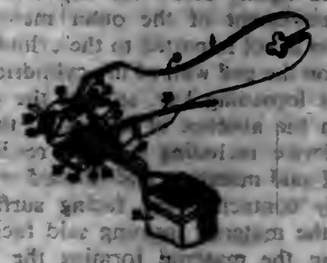
2,774,390
**FLOAT UNDER THE WIRE**
Frank W. E. Hoosibeath, Carlisle, Pa., assignor to C. H. Masland & Sons, Carlisle, Pa., a corporation of Pennsylvania
Application July 5, 1955, Serial No. 519,747
6 Claims. (Cl. 139—403)



1. The method of weaving a pile carpet, using a plurality of pile warp ends, binder warp ends, stuffer warp ends and wefts, which comprises lowering pile warp ends into lower position, raising some other warp ends, inserting a shot of weft above the pile warp ends; raising some of the pile warp ends to upper position, raising some of the pile warp ends to intermediate position, lowering some of the warp ends, inserting a cutting wire between the upper and intermediate pile warp ends, inserting a shot of weft between the lower and intermediate warp ends; continuing the weave and subsequently raising different pile warp ends to the upper position, maintaining the same ends which were previously in the intermediate position again in the intermediate position and lowering the ends previously in the upper position to the lower position, inserting a cutting wire in the upper position and inserting a shot of weft in the lower position; continuing the weave and finally lowering the pile warp ends previously in the intermediate position to the lower position, raising some other warp ends half way and inserting a shot of weft above the pile warp ends formerly in the intermediate position to terminate a low float, the low float extending over at least two wefts in the face of the fabric, the pile warp ends having a weight of between 20 and 45 yards per ounce and the height of the cutting wires being not in excess of 0.150 inch, and withdrawing the cutting wires to cut the pile over the wires and release the low floats to rise above the cut pile.

---

2,774,391
**DEVICE FOR FORMING WIRE HANDLES**
Francis C. Bertram, Maryville, N. Y., assignor, by mesne assignments, to Reif-Rexoll, Inc., Buffalo, N. Y., a corporation of New York
Application March 19, 1952, Serial No. 277,498
7 Claims. (Cl. 140—75)



1. A device for producing a multiple bend wire handle from a length of wire rod comprising, a block, die means movable toward one end of said block to bend the ends of a length of wire rod therearound and form the hand grip and leg portions of a handle, forming dies, means mounting said forming dies for movement toward said block on one side of said leg portions, means for then rotating said forming dies to partially bend said leg portions, and slidable dies mounted for movement toward said forming dies and into engagement with such leg por-

tions to complete bending thereof by moving said leg portions relative to said forming dies in a manner and to an extent further rotating said forming dies.

---

2,774,392
**WIRE WORKING TOOL**
Dustin C. Cerne, Lannsville, Ohio
Application August 26, 1953, Serial No. 376,577
3 Claims. (Cl. 140—124)

1. An improvement in wire working tools of the type having a handle, a head rotatably mounted on the handle and having an axially extending wire-receiving opening therethrough and a peripheral wall, said improvement comprising, in combination, means formed on a side portion of said head and adapted to unwrap a coil of wire from around a strand of wire, said means including a groove for liftingly engaging the wire being unwrapped, said groove including a bottom surface for applying force to said wire, and spaced side surfaces for retaining said wire on said bottom surface and a cam surface adjacent an inner open end of said groove to guide and provide clearance for the wire being unwrapped; a ratchet formed on said head; a spring-pressed pawl pivotally mounted on the handle and in unidirectional driving engagement with said ratchet for operating said means upon actuation of said handle.

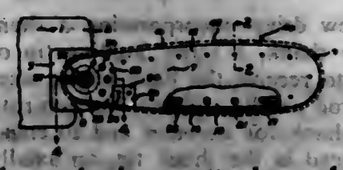
---

2,774,393
**FRUIT JUICE DISPENSER**
William S. Swan, New York, N. Y.
Application October 20, 1955, Serial No. 541,710
3 Claims. (Cl. 141—18)

2. A multiple variety liquid dispenser comprising a container housing having a lid thereon, a removable wire rack divided vertically into container receiving trays to support containers thereon, the lower tray being spaced vertically from the bottom of the rack and having a plurality of equi-spaced fluid storage container recesses and an upper tray spaced above the container recesses and having a horizontal tray area for supporting a number

of fluid supply containers thereon, individual storage container dispensers insertable into the recesses in said lower tray, a plurality of individual spigots projecting outwardly from said container housing and communicating each with an individual fluid storage container through the housing, fluid supply receiving containers having bottom pour spouts selectively positioned in the containers so that each pour spout communicates with an individual storage container therebelow, said fluid supply receiving containers being supported on said horizontal tray area above the fluid storage container recesses and fluid storage containers, liquid supply can puncturing means positioned within the fluid supply receiving containers whereby upon depressing a fluid filled can onto the puncturing means, fluid will flow into a fluid supply receiving container and through the pour spout and then into the storage container below.

---



2,774,394
**EXHAUST SYSTEM**
Ellen N. Meese, Swampscott, and Lloyd E. Shaw, Newburyport, Mass., assignors to Columbia Broadcasting System, Inc., Salem, Mass., a corporation of New York
Application August 18, 1951, Serial No. 242,547
10 Claims. (Cl. 141—65)

1. An exhaust system comprising, a member to be evacuated, a pump having an intake stack, a tube connecting said intake stack to said member, and a trap connected to said intake stack, said tube penetrating said trap and terminating in an open end therein, said tube having a lateral aperture formed therein preventing the passage of solid material, but permitting the free flow of gases therethrough.

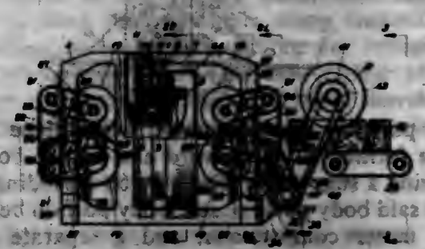
---

2,774,395
**CHAIN SAWS**
Charles J. Tweedie, Fanny Bay, British Columbia, Canada
Application March 23, 1956, Serial No. 573,482
4 Claims. (Cl. 143—32)

1. In a chain saw having a cutter bar and a saw chain adapted to encircle the cutter bar, said cutter bar having side plates defining a peripheral channel, each of said side plates having a groove spaced from the edge of the cutter bar to form a pair of ball races, said chain being formed with links connected together in a single plane, each of said links having a pair of apertures, a bearing ball loosely retained in each of the apertures, said links being located in the channel and said balls being located in the races.

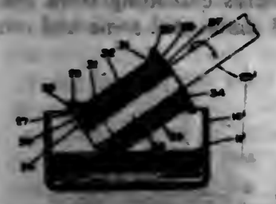
---

2,774,396
**SAW CHAIN, TOOTH THEREFOR AND METHOD OF CUTTING**
Dewey E. Gemmel, Indianapolis, Ind., assignor, by mesne assignments, to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application February 19, 1951, Serial No. 211,742
21 Claims. (Cl. 143—139)



1. A saw chain comprising a plurality of pivotally-joined links, certain of said links having formed thereon laterally-extending slicing elements extending from one marginal edge of said chain toward, and traversing the longitudinal median plane of said chain, said certain links being longitudinally spaced in said chain and some of them having their slicing elements extending from one marginal edge of said chain while others of them have their slicing elements extending from the opposite marginal edge of said chain, said some and other certain links

having their slicing elements disposed so as to intersect the path of the next preceding slicing element so as to separate completely an independent chip from the material sawed, and a depth gauge for each slicing element positioned in said chain ahead of the corresponding slicing element to control the depth of cut of such slicing element comprising means defining an active end portion adapted to engage the surface of the material sawed created by the immediately preceding slicing element.



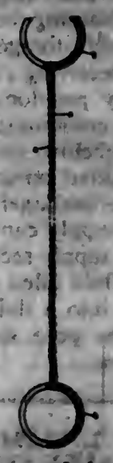
---

2,774,397
**BARKING MACHINE HAVING FEED ROLLER POWER-DRIVEN AT CERTAIN PERIPHERAL SPEED OR LOG-DRIVEN AT HIGHER SPEED**
Nils Gustav Leffler, Sundsvall (near Sundsvall), Sweden, assignor to Svenska Cellulosa Aktiebolaget, Stockholm, Sweden
Original application October 31, 1952, Serial No. 317,980. Divided and this application February 12, 1954, Serial No. 409,912
Claims priority, application Sweden November 3, 1951
5 Claims. (Cl. 144—247)

1. An improvement in a barking machine of the kind having at least one barking tool movable into and out of engagement with an axially fed log, the barking tool and the log being relatively rotatable about a longitudinal axis of an axially fed log, and said machine having conventional means for feeding a log at a given axial speed, said improvement comprising at least one rotatably driven member located in a feeding path of an axially fed log, means connecting said member to a driving mechanism which rotates said member at a certain peripheral speed not exceeding said given axial speed of a log, means supporting said member for rotation about an axis transverse to and spaced from said longitudinal axis of a fed log, said supporting means being swingable about a second transverse axis spaced from that side of said longitudinal axis opposite to said first transverse axis and also spaced from said log-feeding path, an oncoming log engaging said member and swinging said supporting means about said second transverse axis until said member rests against a log, whereby said driving mechanism will cause said member to drive a log forward only when the axial speed of a log, because of too much feeding resistance, drops below said certain peripheral speed.

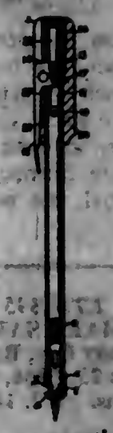
2,774,398
**METHOD OF PRODUCING PLASTIC RIM SPOOLS**
Louis H. Morin, Bronx, N. Y., assignor to Coats & Clark Inc., a corporation of Delaware
Application March 5, 1951, Serial No. 213,968
7 Claims. (Cl. 144—309)

1. The herein described method of forming a spool which consists in mounting a spool body on a mandrel disposed at an acute angle to the surface of a settable coating fluid, submerging a flange end of the spool body in the coating fluid to an extent submerging one corner portion only of a flange end, rotating the mandrel and spool body, thus submerged, to apply a ring-like deposit of the fluid on the flange end of the spool body, thus completely enveloping the flange thereof, then raising the spool body above the level of fluid while continuing rotation of said body to displace excess fluid, leaving a deposit of the fluid on said spool body, setting the deposit, and nicking said flange end of the spool body by cutting through the set deposit to form a non-chippable, thread-holding nick in said end.



2,774,399
**POWER OPERATED WOOD PLANE WITH CHIP AND SHAVING DISCHARGE MEANS**
Arthur N. Emmons, Nedrow, N. Y., assignor to The Porter-Cable Machine Company, Syracuse, N. Y., a corporation of New York
Application March 15, 1955, Serial No. 494,353
8 Claims. (Cl. 145—4)

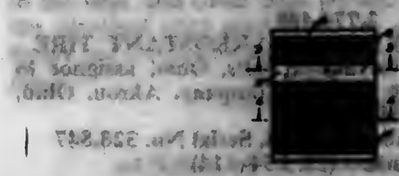
1. A portable power-operated wood plane comprising a frame formed at its forward end with a body portion and having a supporting shoe portion extending rearwardly from said body portion, said body portion being formed with a cutter compartment and a separate chip compartment located forward of said cutter compartment, the lower portions of said compartments being in communication, said compartments extending transversely of the frame and being open at like ends for the discharge of shavings and chips therefrom, said cutter compartment having an opening in the bottom wall thereof, a motor mounted on the frame at the ends of said compartments opposite to said like ends and having a power shaft extending into said cutter compartment, a cutter mounted on said shaft and being exposed through the opening in the bottom wall of said cutter compartment, and a depth adjustment shoe mounted at the forward end of said body portion for movement vertically toward and from the plane of said supporting shoe.



2,774,400
**POCKET-SAW WITH WIRE-REINFORCED BLADE**
Werner Frichleben, Schweppenhausen, Germany
Application October 20, 1954, Serial No. 463,456
Claims priority, application Germany April 29, 1954
2 Claims. (Cl. 145—31)

1. A pocket-saw comprising a saw blade toothed at both edges with the teeth of the opposite edges pointing in opposite directions, at least two steel wires twisted in spaced parallel relation with the saw blade, the terminal portions of the blade being toothless and wound together

with the terminal portions of the said wires round rings forming the handles of the saw.



2,774,401
**SCREW-HOLDING DRIVERS**
Arthur Blakey Hallam, Leeds, England, assignor to Chas. F. Thackray Limited, Leeds, England, a British company
Application July 20, 1953, Serial No. 369,179
Claims priority, application Great Britain July 28, 1952
7 Claims. (Cl. 145—52)

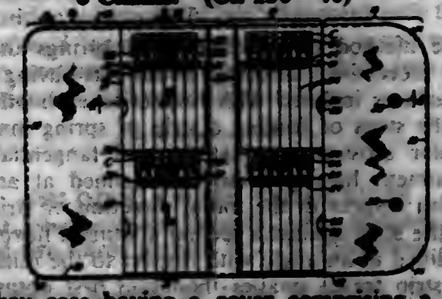
1. A screw driver incorporating a shank, means for rotating the shank, a screw holding tip on the end of said shank to receive the head of the screw, a pressure applicator rod axially slidable but non-rotatably mounted in said shank for its outer end to engage and clamp the screw head in the shank tip, an axially displaceable spring loaded driver tip in said clamping end of the rod to engage the screw head and rotate with the rod, a pivoted lever connected by a link to the rod to give it axial movement and apply pressure on the screw head, said lever being connected through its fulcrum to a mounting element, an adjustable thrust member engaging the said element to make the pressure applicator rod initially adjustable in relation to a screw head, and means providing resilience of the operating lever adjacent its fulcrum between the latter and the pivot of its link connection to the rod to ensure a firm grip on a screw head and allow for slight variations in screw heads.

2,774,402
**VENTILATED PLASTIC BAG**
Richard H. White, Adrian, Ga.
Application December 1, 1951, Serial No. 259,347
3 Claims. (Cl. 150—1)

1. A ventilated bag made of plastic sheet material, said sheet material having an imperforate border portion, perforate portions lying within said border portion and integrally formed therewith, and an imperforate intermediate portion lying within said border portion between said perforate portions, said perforate portions each comprising

a plurality of filaments which are integrally connected in a manner to form ventilating openings therebetween, said sheet being joined together at opposite portions and sealed against itself along at least one other portion.

2,774,403
**SHORT BAG GOLF CLUB CARRIER**
Norman Bruce Williamson, Portland, Oreg., assignor to Jarman-Williamson Company, a partnership
Application April 27, 1953, Serial No. 351,440
1 Claim. (Cl. 150—1.5)



An attachment for golf carts comprising a short bag for the handle ends of clubs, said bag having a bottom wall, a peripheral side wall with a top rim and a vertical dividing wall forming two compartments within the bag, said dividing wall being deflectable in opposite directions into one or the other of said compartments to form a large mouth in the opposite compartment, a flap on the upper end of said dividing wall adapted to overlie the rim of said peripheral wall, releasable fastener means on said flap and rim, a rigid supporting hoop for said side wall, the upper edge of said side wall being folded over said hoop to form said top rim, and a clamp on said hoop for securing the bag on a cart.

2,774,404
**WALLET OF UNITARY CONSTRUCTION**
David B. Hoggatson, Leslie, Ark.
Application November 22, 1955, Serial No. 548,335
5 Claims. (Cl. 150—36)

1. A wallet comprising a back panel, a front panel, a first intermediate panel, and a second intermediate panel, said back and front panel being connected along the lower edges thereof, the first intermediate panel being connected to the top edge of the back panel and disposed against the inner surface thereof, the second intermediate panel being connected to the top edge of the front panel and disposed against the inner surface thereof, an outwardly extending tab on each end of said back panel, an outwardly extending tab on one end of said first intermediate panel, means on said front panel for interlocking engagement with the tab on the first intermediate panel and the tab on the end of the back panel remote from the tab on the first intermediate panel, said tab on the other end of said back panel adapted to bridge the free ends of the wallet for retaining the wallet in folded relation.

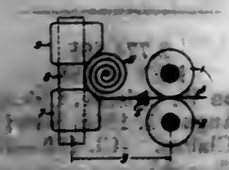
2,774,405
**KEY CASE**
Sherman W. Grisolle, Chicago, Ill.
Application August 1, 1955, Serial No. 525,424
6 Claims. (Cl. 150—40)

1. A key case having a cover comprising a pair of laminated flexible plastic sheets joined together along the peripheral edges thereof, said cover having a pair of transversely extending inner sections adjacent each other and a pair of transversely extending outer sections at opposite ends thereof, at least one key-holding assembly being mounted upon each of said inner sections and providing a longitudinal series of transversely extending swivel key hooks adapted to hold a plurality of keys, a transparent sheet of flexible plastic being mounted upon said inner sections and interposed between said inner sections and said key-holding assemblies, said transparent sheet being secured to said inner sections along transverse lines extending along adjacent portions of said inner sections, and along longitudinally extending lines on opposite side edges of said inner sections and adjacent said series of key-holding assemblies, said outer and inner sections being foldable along transverse fold lines extending between said sections for bringing said series of key-holding assemblies into facing alignment with one of said outer sections interposed therebetween, and fastening means for securing said sections in folded relation.

2,774,406
**METAL CONTAINER BODY SIZER**
Thomas A. McCoy, Stockton, Calif., assignor to Caruado Machine Works, Stockton, Calif., a partnership
Application January 14, 1954, Serial No. 404,073
3 Claims. (Cl. 153—45)

1. A device for sizing an open-ended cylindrical container body by expanding the same, said device comprising a pair of opposed alined units relatively movable toward and from each other into and out of the body to be sized from the ends thereof, and means to so move the units; each unit including a plurality of shoes, longitudinally flat on their outer faces, and arranged in a circumferential row to fit into the container body before the latter is expanded and means to move the shoes radially out after they are disposed within the container body whereby to expand the same; the shoes of the two units meeting each other in end to end alinement when the units are fully moved toward each other and together having a length not less than that of the body.

2,774,407



## METHODS OF AND MACHINES FOR WINDING SPIRAL SPRINGS

William I. B. Isaacson, Paris, France

Application April 26, 1951, Serial No. 222,973

Claims priority, application Switzerland April 27, 1950

7 Claims. (Cl. 153—65)

1. The method of winding spiral springs utilizing a series of successively arranged abutments having flat frictional surfaces inclined with respect to each other comprising the steps of forcing a strip of spring material of rectangular cross-section against and tangentially of a first abutment having a surface inclined at an obtuse angle with respect to the initial direction of strip travel, forcing the strip against a second abutment having a surface inclined at an angle with respect to the initial direction of strip travel smaller than said first obtuse angle, forcing the strip against a third abutment having a surface inclined at an acute and even smaller angle with respect to the initial direction of strip travel, the included angles between said three successive abutment surfaces being progressively smaller whereby the frictional resistance of the surfaces causes the strip limit of elasticity to be surpassed resulting in permanent deformation of said strip to curvilinear form, and finally relatively displacing the abutments as the winding progresses to increase the spacing of the regions of the adjacent pairs of friction surfaces contacted by said strip, thereby to increase the spring diameter.

2,774,408

## FLARING TOOL

George E. Franck, Riverside, Ill., assignor to The Imperial Brass Manufacturing Company, a corporation of Illinois

Application May 4, 1953, Serial No. 352,929

6 Claims. (Cl. 153—79)

5. A tube flaring tool comprising a frame including means providing an axially elongated opening, a force applying member mounted in said opening and accurately guided thereby for axial movement, said force applying member terminating at one end in a flaring cone head, tube clamping means rigid with said frame for holding a tube to be flared in axial alignment with said force applying member, a carrier movably mounted on said frame and a flare forming adapter loosely carried by the carrier for movement relative to said carrier in the direction of movement of said force applying member and limitedly in a plane normal to its own direction of movement during the primary tube flaring operation, said adapter at one end being shaped to produce a flare on a tube in the clamping means when forced against the tube by said force applying member and at the other end having a recess complementary to the shape of and receiving the head of said force applying member with a close fit therein to be thereby placed and held in accurate alignment with the tube to be flared and said force applying member.

2,774,409

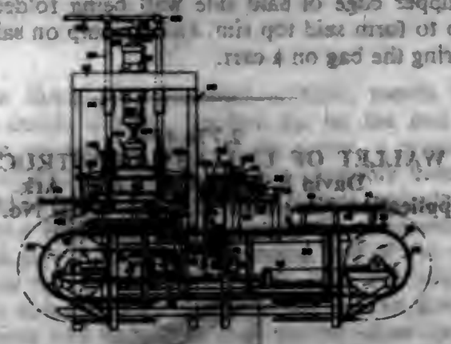
## METHOD OF MAKING SKID-RESISTANT TIRE

Frank O. Skidmore, Cuyahoga Falls, Ohio, assignor to The General Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

Application December 31, 1952, Serial No. 328,847

7 Claims. (Cl. 154—14)

3. A process of retreading a tire comprising the steps of buffing off the tread of said tire to form a buffed crown of substantially uniform width, buffing off the tread of a second tire and cutting the shoulders thereof to form a strip of substantially uniform thickness having a width substantially the same as that of said buffed crown and a length several times said width, assembling the cut strip over said buffed crown with a vulcanizable adhesive compound disposed between said crown and said strip and with the fabric side of the strip providing a road-engaging surface, placing the assembled tire in a retread mold, and vulcanizing the adhesive compound in said mold.



2,774,410

## METHOD AND APPARATUS FOR TENSIONING AND EDGE TURNING THE COVER MATERIAL OF AUTOMOBILE DOOR LAMINATED PANELS

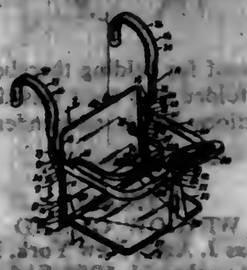
Clarence J. Davies, Detroit, Mich., assignor to National Automotive Fibres, Inc., Detroit, Mich., a corporation of Delaware

Application August 31, 1953, Serial No. 377,338

19 Claims. (Cl. 154—41)

1. Apparatus for tensioning and edge turning a cover of a laminated panel, which comprises a support conforming closely in size and shape to the panel against which the panel with its cover is positioned with the cover interposed between the panel and support with marginal portions of the cover extending beyond the edges of the panel and support, a frame movable relative to said support perpendicular to the plane of the panel, a friction device on said frame movable across the edges of the support in frictional engagement with the marginal portion of the cover to tension the cover, a pressure pad movable toward and away from said support and engageable with the panel to press the cover and panel against said support to retain tension in the cover while said friction device remains in contact with the marginal portion of the cover, said frame being movable past said

support to release the marginal portion of the cover and movable in reverse direction to start to form the marginal portion of the cover around the panel, and flexible diaphragm means actuated by fluid pressure to conform to the edge and cover edge portion of the panel to turn the marginal edge portion of the cover and to press it firmly and uniformly against the rear edge portion of the panel.



2,774,411

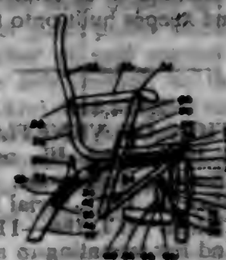
## AUXILIARY AUTOMOBILE SEAT

Dennis Berlin, Philadelphia, Pa.

Application March 29, 1954, Serial No. 419,363

3 Claims. (Cl. 155—79)

1. A foldable auxiliary seat adapted for attachment to the back of a chair, said auxiliary seat comprising a back member, a movable seat member movably attached to said back member, a child restraining bar movably attached to one side of said back member and detachably attached to the other side of said back member, said detachable attachment of said restraining bar permitting lateral movement of said restraining bar for the placement or removal of the child into and out of the confines of said auxiliary seat, said back member being of metal having outwardly extending upper portions, vertical pivots therethrough, attachment hooks mounted upon the pivots, a recess at one side of the back member and a U-shaped member vertically pivoted in said recess, and one end of said restraining bar attached to said U-shaped member, a seat supporting strap detachably connected to said restraining bar and said back and being adapted to serve as a seat per se whereby said seat can be dropped beneath said supporting strap.



2,774,412

## RECLINING CHAIR WITH EXTENSIBLE SECTIONAL LEG REST

Johannes Lachhardt, Berlin-Dahlem, Germany, assignor, by mesne assignments, to Norman P. Martin and Otto L. Walter as trustees of Delta Trust, Lake Worth, Fla.

Application July 6, 1953, Serial No. 366,988

11 Claims. (Cl. 155—110)

3. An article of repose for supporting the body of a person, comprising in combination: a support, a seat swingably arranged on said support, controlling means movably arranged on said support, said controlling means and said seat being in operative relation to each other so as to perform movements in predetermined relation to each other, a leg-rest structure including a main portion and an extension movably joined at adjacent ends, the main portion of said leg-rest structure being swingably mounted on the front end portion of said seat, said controlling means being operatively engaged with said main portion of the leg-rest structure so as to effect movements of the latter in coordination with movements of said seat, said extension of the leg-rest structure being in a folded position relative to said main portion of the leg-rest structure when the latter is in a sitting position, and a double-armed lever swingably mounted on said main portion of said leg-rest structure, a first link pivoted at one of its ends to one arm of said double-armed lever and at its other end to said extension, and a second link pivoted at one of its ends to the other arm of said double-armed lever and at its other end to said seat, whereby said extension of the leg-rest structure is swung from its folded position substantially into alignment with the main portion of said leg-rest structure during a movement of said main portion from said sitting position into another end position by said controlling means.

2,774,413

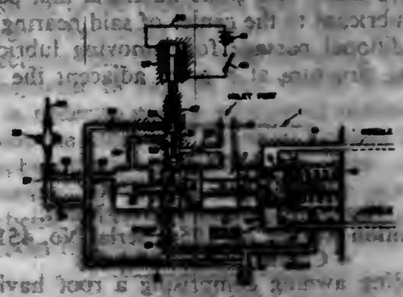
## FOLDING CHAIR STRUCTURE

William L. Shepherdson, Phoenix, Ariz., assignor of sixty-six and two-thirds percent to J. E. Meacham, Phoenix, Ariz.

Application January 26, 1956, Serial No. 561,411

3 Claims. (Cl. 155—196)

1. A folding chair structure including a leg assembly having a cross rail, dowel pin means on the top of said rail, a seat, means on the under side of said seat to receive said dowel pin means, a link pivotally connected to said leg assembly below said cross rail and pivotally connected to the underside of said seat at a point inwardly from said cross rail, and a latch means between said rail and the under side of said seat having a point of clamping pressure located within a triangle defined by the pivotal connections of the ends of said link and the point of engagement of said dowel pin means with said seat.



2,774,414

## FUEL FLOW EQUALIZER VALVE

Sigmund Maschinski, Penasco, N. Y., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware

Application April 26, 1950, Serial No. 158,274

3 Claims. (Cl. 158—36)

1. For use in distributing fuel equally to a plurality of fuel nozzles for a variable speed engine; the combination comprising a fuel flow regulating valve having a plurality of variable size orifices controlled thereby to regulate flow of fuel to each of said nozzles, a spring biasing said regulating valve in a sense to close said orifices to the flow of fuel, input fuel pressure responsive means for biasing said regulating valve in a sense for opening said orifices to the flow of fuel to said nozzles so as to main-

tain substantially equal flow of fuel to said nozzles, stop means for limiting the movement of the valve in said closing sense, a drain line controlled by said valve, operator-operative means to actuate said stop means to an inoperative position, a control valve for said pressure responsive means, said actuating means operatively connected to said control valve so as to cause the pressure responsive means to permit the spring to effect movement of said regulating valve in a sense to connect said nozzles to the drain line upon the actuation of said stop means to an inoperative position.

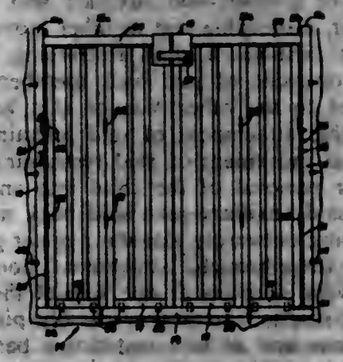
---

**2,774,415**
**EVAPORATOR**
Harold H. Belcher, Orange, Mass., assignor to Rodney Hunt Machine Company, Orange, Mass., a corporation of Massachusetts
Application October 25, 1951, Serial No. 253,126
15 Claims. (Cl. 159—6)

1. In an evaporator, including a chamber having a substantially vertical cylindrical wall, a rotor rotatably mounted in said chamber substantially coaxial with said wall, a plurality of vanes radially spaced around said rotor and extending outward therefrom into close proximity with said wall, means for rotating said rotor, means at the upper end of said chamber for introducing liquid to be evaporated, and heating means on said wall below said inlet; a substantially flat plate detachably secured to said chamber and closing the lower end thereof; and said plate having a plurality of circumferentially spaced outlets for unevaporated concentrate, a downwardly and outwardly flared member secured at its base to said plate within said chamber substantially centrally of said chamber, the outer edge of said member being adjacent said outlets to deflect the concentrate outward toward said outlets and bearing structure for said rotor rigidly secured to said plate, said plate having a first passage for supplying lubricant to the center of said bearing structure and an additional passage for removing lubricant from said bearing structure at a point adjacent the periphery thereof.

---

**2,774,416**
**FOLDING AWNING**
Harvey L. Angus, Havre, Mont.
Application August 24, 1954, Serial No. 451,774
4 Claims. (Cl. 160—68)



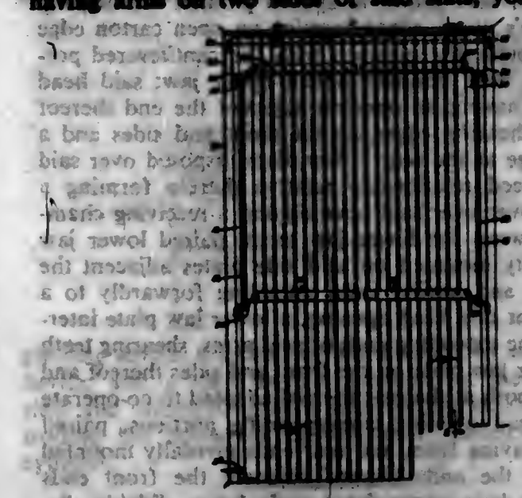
1. A folding awning comprising a roof having upper and lower sections and being movable between a raised, folded position and a lowered, opened position, means hingedly supporting the upper section by its upper portion for vertical swinging movement, means hingedly connecting the upper end of the lower section to the lower end of the upper section for relative swinging and folding movement, a brace pivoted at one end to the lower end of the lower section and at its other end supported for vertical swinging movement for joint movement with the roof, a foldable end hinged to said roof, said end comprising a pair of end sections each hinged to one of said roof sections at the outer edge and to

the underside thereof for folding therebetween when said roof sections are folded into their raised and folded position, said end sections being independent of each other.

---

**2,774,417**
**WINDOW GUARD**
Thomas J. Agar, New York, N. Y.
Application December 31, 1954, Serial No. 479,010
1 Claim. (Cl. 160—104)

A window guard for double-hung windows, comprising side frame members and a base portion adapted to be securely fastened to a window frame; a grille made up of two foldable halves having lugs, adapted to interlock into openings in the base portion; a pair of top frame members adapted to fit over the upper portions of the grille halves, said grille being capable of fitting within the frame formed by the said top frame members, side frame members, and base portion; and a link, having a portion adapted to fit over and receive the top of the grille assembly, and said link having another portion adapted to fit under and receive the lower end of a window frame, said link having a removable section adapted to be attached to said link by means of a hook and keeper built onto the components of said link.



---

**2,774,418**
**CONSTRUCTION OF VENETIAN BLINDS**
Walter Turkewski, Hollywood, Ill., assignor to Walter Turkewski and Bernice Turkewski, Hollywood, Ill.
Application May 25, 1951, Serial No. 228,161
6 Claims. (Cl. 160—118)

1. A window blind for mounting in a rectangular window frame including a U-shaped frame having a horizonal top cross frame member and vertical side frame members, a rod in said top cross-frame member having its ends extending beyond both ends of said top cross-frame member and adapted to support said window blind on brackets in said window frame, a plurality of vertically positioned slats, each having means for supporting said slats on said rod for sliding movement longitudinally of said rod and for pivotal movement of said slats on their individual axes, and means for imparting sliding movement to said slats to gather the same together adjacent

a side frame member, turning the same about their longitudinal axes, or draping the same adjacent their lower ends, said means including a control member having arms on two sides of said slats, yoke members

pivotally connected between said arms, said slats extended through said yokes, a lever connected to a side frame member, said arms pivotally connected to said lever and said lever vertically slidably mounted in said side frame member.

---

**2,774,419**
**VENETIAN BLIND**
Hans Börje Thysell, Anderslev, Sweden
Application October 28, 1953, Serial No. 387,173
Claims priority, application Sweden October 23, 1952
6 Claims. (Cl. 160—168)

1. A Venetian blind comprising head and bottom rails, a plurality of slats therebetween, ladder tapes including opposed side members and slat supporting cross rungs extending between said slide members, shafts in the head rail longitudinally thereof and having screws formed on part thereof, means in said head rail disposed adjacent each of the ends of said shafts and carrying said ladder tapes, a slide reciprocable in said head rail and provided with apertures adapted to the cross-sectional form and size of the screws on said shafts which are introduced into said apertures of the slide, cord pulley means in said slide, guide pulley means in said head rail, a pair of control cords extending from the bottom rail of the blind over said guide pulley means to the cord pulley means in said slide, one of said control cords passing from said cord pulley means in said slide outside the blind at one side thereof, and further guide pulley means in said head rail for leading the other of said control cords outside the blind at the same side thereof, so that when a pull is exerted on one control cord only the slats of the blind will be set at the desired angles, while a pull exerted on both control cords simultaneously results in a raising of the blind, and a release of both control cords simultaneously in a lowering of the blind.

---

**2,774,420**
**COVER FOR HATCHES, WAGGONS AND THE LIKE**
Claude Lisowski, Villeneuve-sur-Verre, France, assignor to International MacGregor Organization (I. M. G. O.), Casablanca, Morocco, a body corporate of Morocco
Application January 4, 1955, Serial No. 479,757
Claims priority, application France January 22, 1954
4 Claims. (Cl. 160—193)

1. In ship's hatches, railway waggons and the like comprising an opening with longitudinally extending lateral parallel guideways flanking the opening formed by plane surfaces and constituting a straight open rolling path, a cover arrangement comprising a plurality of separate cover sections adapted to ride on said guideways and to spread over said opening while forming an unbroken sheet over said latter, rolling means mounted on the edges of said sections in rolling engagement with said guideways, said rolling means resting on said guideways by the virtue of the weight of the corresponding section and freely rolling thereon to close and open said opening, a stowage space at one end of said opening with lateral longitudinal runways for locating said sections in the folded condition when the hatch is open, said sections resting in said stow-

age space in a vertical position and substantially on an edge, rigid link means for pivotally interconnecting any two separate and adjacent sections and transmitting operating thrusts and tractions, pivot means connecting each of said link means at one of its ends to the rear end portion of the section of said pair which is remotest from the stowage space, and at a substantially intermediate portion of the other section of the pair, said sections resting in said stowage space on the said runways by means of said pivot means which belong to the rear portion of the relevant sections, and rope means connected at least to the section which is remotest from the stowage space for ensuring the control of all said sections.

---

**2,774,421**
**HEAT-REFLECTING LIGHT-TRANSMITTING WINDOW SHADE OR THE LIKE AND MATERIAL FOR USE IN MANUFACTURING THE SAME**
Kurt S. Lion, Watertown, Mass.
Application October 6, 1937, Serial No. 167,493
4 Claims. (Cl. 160—238)

1. A shade for a window of a room comprising a carrier medium and a metal medium carried thereby that is highly reflective to rays in the infra-red portion of the spectrum in order to prevent substantial radiation of heat from outside the room into the room through the window, that is highly non-absorptive of the said rays in order to prevent substantial transfer of absorbed heat from the shade to the room, and that is thin enough to be substantially transparent to rays in the visible portion of the spectrum, the carrier medium being also substantially transparent to rays in the visible portion of the spectrum in order to permit substantial radiation of light from outside the room into the room through the window though substantially preventing the heat outside the room entering the room through the window, and the shade being dulled in order to diffuse the light radiated into the room through the window.

---

**2,774,422**
**TIME DELAY MECHANISM**
Eric Clay Fielding, London, England, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application September 14, 1953, Serial No. 380,055
Claims priority, application Great Britain September 16, 1952
4 Claims. (Cl. 161—1)

4. Time-delay electric switching apparatus comprising a source of electrical power, a gear-wheel bearing a dial

for indicating intervals of time, a switch operating means coupled to said gear wheel for operating an electrical switch after an interval of time as indicated by said dial; an electric motor coupled to said power source for driving a gear-train, clutching means coupled to said gear train for driving said gear wheel in one direction from a starting position, to operate said switch and to wind up a spring; an electro-magnetic means for controlling said clutching means; means in said switch for disconnecting

electric power from said motor upon operation of said switch; means in said gear train operable via said clutching means for preventing unwinding of said spring when said electric motor is disconnected; a balance-wheel and escapement means for controlling the rate of unwinding of said spring and driving said gear wheel in the opposite direction to said starting position, upon the failure of electric power to said electro-magnetic means; and means for preventing the operation of said escapement means during the forward driving process of said gear wheel.

---

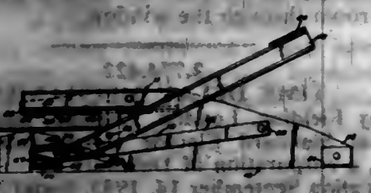
2,774,423

## SAFETY DEVICE FOR USE IN THE PRODUCTION OF TOW

Ernest J. Griest, Jr., Asheville, N. C., assignor to American Enka Corporation, Enka, N. C., a corporation of Delaware

Application October 27, 1954, Serial No. 464,986
6 Claims. (Cl. 164—36)

1. In tube spinning apparatus for tow, guiding means defining a straight line tow path beyond the end of the last tube in the system, yieldable means normally modifying said straight line path, a knife extending in cutting relation to said straight line path whereby when the tension is excessive the resilient means yields and moves the tow into contact with the knife.



---

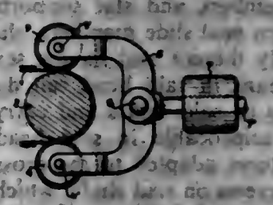
2,774,424

## CORRUGATED CARTON HANDLE FORMING MACHINE

Joseph E. McNamara, Detroit, Mich.

Application April 18, 1956, Serial No. 581,921
4 Claims. (Cl. 164—43)

1. A corrugated carton handle forming machine comprising spaced parallel vertical side plates having lower edges forming a supporting base, a front end, a rear end, upper edges on said plates, means interconnecting said plates adjacent their lower edges, neck portions on said plates intermediate the ends thereof rising above said plates, a head portion disposed between said plate neck portions and cantilevered forward to a point adjacent the front ends of said plates in spaced parallel relationship to said plate's upper edges forming an open carton edge receiving mouth therebetween with the cantilevered portion of said head constituting an upper jaw; said head jaw portion having an opening adjacent the end thereof defined by shearing edges on the front and sides and a crimping edge at the rear; a top plate disposed over said head in spaced relationship relative thereto forming a protective cover over said opening and a receiving chamber therebetween for lower jaw teeth, paired lower jaw arms pivotally mounted on said side plates adjacent the rear thereof and having ends extending forwardly to a point adjacent said head opening, a lower jaw plate interconnecting the extending ends of said arms, shearing teeth on said lower jaw plate on the front and sides thereof and a crimping tooth at the rear thereof adapted to co-operate with said head opening corresponding portions; paired lever arms having front and rear ends pivotally mounted intermediate the ends thereof adjacent the front ends thereof; said lever arms front ends being slidably disposed beneath said lower jaw plate; a pad member interconnecting said lever arm rear ends, a spring mounted on said lower jaw adapted to urge said lower jaw and associated linkage out of association with said head to maintain the mouth area normally open, and a resilient member in said head opening area adapted to prevent the lanced and crimped portion of a carton from entering said head opening.



---

2,774,425

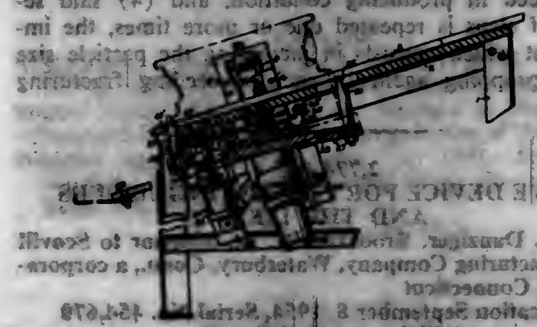
## MEANS FOR LONGITUDINALLY SLITTING WEBS OF PAPER OR OTHER FLEXIBLE MATERIAL

Victor Hermstein, Duesseldorf-Lohausen, and Karl Schelp, Duesseldorf-Werdan, Germany, assignors of one-half to Jagenberg-Werke Akt.-Ges., Duesseldorf, Germany

Application December 18, 1953, Serial No. 399,138
15 Claims. (Cl. 164—60)

1. Means for slitting a web of paper or other flexible material longitudinally thereof comprising a smooth counter-cylinder around which a web to be slit passes, disk-knife means movably mounted with respect to the axis of the counter-cylinder and cooperating with one portion of the counter-cylinder for slitting the web, said disk-knife means having an axis parallel to the cylinder axis, additional means freely rotatable about an axis parallel to the aforementioned axes and cooperating with an opposite portion of the counter-cylinder and means operably coupling the said additional means to the disk-knife means so as to constitute a distance sustainer for the disk-knife means.

---



2,774,426

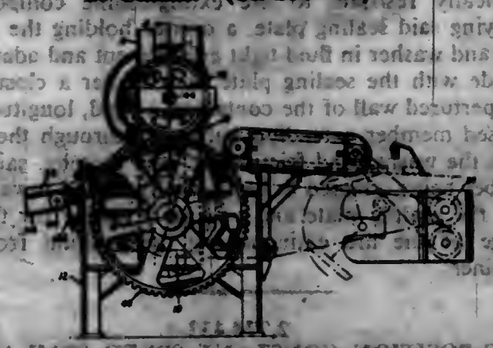
## PIERCING MACHINE

Frederick P. Sharpe, Dearborn, Mich., assignor to Kelsey-Hayes Wheel Company, Detroit, Mich., a corporation of Delaware

Application November 30, 1953, Serial No. 395,004
5 Claims. (Cl. 164—87)

1. A machine for piercing rims comprising a guide along which the rims are movable, a device for piercing successive rims, a stop device having stops spaced longitudinally of said guide for alternate engagement with adjacent rims to stop the rims successively in registration with said piercing device, a fluid pressure operated cylinder for operating said stop device, a switch actuated by the successive rims for controlling the operation of said

piercing device, a second switch actuated by said piercing device, and a third switch actuated by the successive rims and cooperating with said second switch for controlling the operation of said fluid pressure operated cylinder.



---

2,774,427

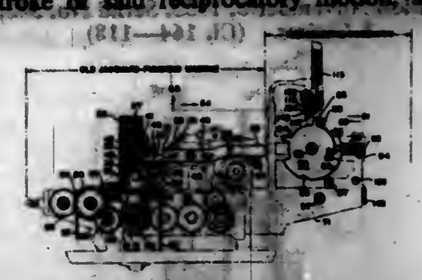
## CONTINUOUS ROTARY CARTON PERFORATING MACHINE

Kenneth L. Crabtree, Fairfield, Maine, assignor to Keyes Fibre Company, Portland, Maine, a corporation of Maine

Application March 17, 1954, Serial No. 416,573
15 Claims. (Cl. 164—49)

1. A perforating machine comprising a conveyor having holding means thereon for positively engaging a workpiece at a predetermined loading station and conveying said workpiece to a perforating position, said holding means being provided with perforating means thereon in a position to contact the workpiece at all times during which the workpiece is on said holding means, movable clamping means adapted to move into timed coinciding and compressive relationship with said holding means at said perforating position whereby said perforating means is caused to pierce said workpiece, stripping means movable with said holding means for stripping said workpiece from said holding means, means for actuating said stripping means when said holding means reaches a predetermined unloading station, and conveyor means for removing said workpiece from said unloading station.

---



2,774,428

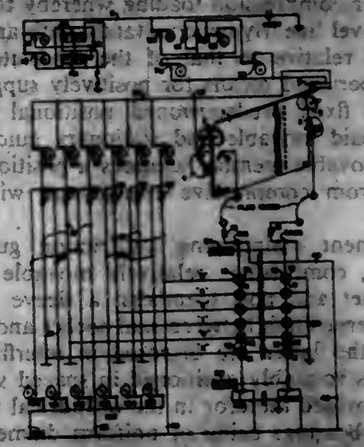
## SELECTOR MECHANISM FOR JACQUARD-PUNCHING MACHINE AND THE LIKE

Frank B. Ware, Moorestown, N. J., assignor to Tarton Knitting Mills, Inc., Philadelphia, Pa., a corporation of Pennsylvania

Application September 9, 1952, Serial No. 308,577
3 Claims. (Cl. 164—112)

1. Selector mechanism for jacquard-punching machines and the like, said selector mechanism including a plurality of individually and selectively movable selectors for actuating corresponding punch-activating elements of said jacquard-punching machine, each of said selectors having an initial or retracted inoperative position, an operative position, and a second inoperative position, means for automatically reciprocating said selectors in unison, means for causing said selectors to move from their operative positions to their second inoperative positions by the return stroke of said reciprocatory motion, and means

for automatically moving said selectors in unison from the last-mentioned position to their initial inoperative positions by any return stroke of the aforesaid reciprocatory motion if such return stroke follows the arrival of all selectors in the aforesaid second inoperative position.



---

2,774,429

## MAGNETIC CORE CONVERTER AND STORAGE UNIT

Edward J. Rabenda, Poughkeepsie, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application May 28, 1953, Serial No. 358,101
10 Claims. (Cl. 164—115)

1. A record converter comprising in combination, sensing means adapted to read information represented by perforations in a record card having columns of information representing index positions in accordance with a first code wherein said index positions are sensed in succession, a storage matrix adapted for storage of information in accordance with a second code and employing a plurality of bistable magnetic elements arranged in columns with the number of elements in each column conforming to said second code and with the information represented as relative stable states of magnetic remanence, means coupling said sensing means and said storage matrix, means operated in synchronism with said sensing means for activating certain combinations of said elements during the sensing of successive index positions whereby information read by said sensing means is simultaneously converted to said second code and stored in said matrix, means for reading information from said matrix in the form of electrical impulses and further means for restoring the elements to the remanence state attained prior to interrogation so that the information may be recorded in a portion of one or more duplicated records having columns of information representing index positions in accordance with said second code, said further means including apparatus for activating certain combinations of said elements subsequent to operation of said means for reading information and in coincidence with said electrical impulses.

2,774,430

## LATCHING MEANS FOR DIE SET RETAINERS

William J. Blazek, New Lexington, Ohio, assignor to Lempco Products, Inc., Bedford, Ohio, a corporation of Ohio

Application November 8, 1955, Serial No. 545,694
8 Claims. (Cl. 164—118)

1. Guide mechanism for the die sets of presses, comprising: a stationary member; a movable member disposed in coaxial order with the stationary member and movable longitudinally into and out of interfitting relationship therewith; a retaining sleeve occupying an annular space formed between said members when the latter are disposed in interfitting order; ball elements rotatably movable in socket-forming openings provided therefor in the wall of said sleeve and having antifriction guiding engagement with the adjacent wall surfaces of said members defining said space, said elements when in simultaneous contact with said member surfaces being placed under compression loading whereby to cause said sleeve to travel linearly concomitantly with and at a controlled rate relative to that of the associated movable guide member; and means for positively supporting said sleeve in a fixed predetermined positional order with respect to said movable and stationary guide members when the movable member assumes a position removing the same from compressive engagement with the ball elements.

3. Alignment maintaining antifriction guide means for die sets, comprising: relatively movable axially arranged socket and post members; a sleeve formed for movable interposition between said socket and post members when the latter are disposed in interfitting order; ball bearings rotatably positioned in spaced seat-forming openings provided therefor in the cylindrical wall of said sleeve, said bearings being of uniform diameter and arranged in said sleeve openings to project equidistantly beyond the inner and outer wall surfaces of the sleeve for simultaneous compressive contact with adjacent wall surfaces of said socket and post members during interfitting longitudinal movement of one of said last-named members with respect to the other, whereby to produce movement of the sleeve in a linear direction concomitantly with relative movement between said members; and means operative when said members attain relative positions in which the bearings of said sleeve are relieved of sustaining compressive forces produced by simultaneous contact of said bearings with said members to effect the support of said sleeve in a definite operational position relative to said members.

2,774,431

## METHOD FOR INCREASING PRODUCTION FROM WELLS

John E. Sherborne, Whittier, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Application August 25, 1954, Serial No. 452,229
15 Claims. (Cl. 166—22)

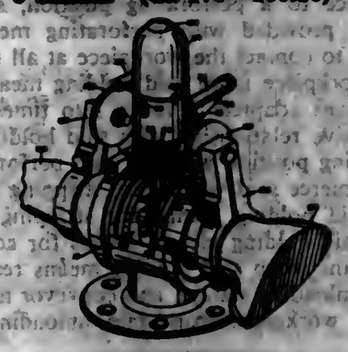
1. In a process for increasing the productivity of a subterranean oil-producing formation penetrated by a well bore wherein (1) a viscous fluid containing a particulate solid propping agent is forced down said well and into said formation under a pressure sufficient to fracture said formation, (2) said fluid is thereafter withdrawn from the fractures so formed leaving said propping agent deposited within said fractures, (3) said well is thereafter placed in producing condition, and (4) said sequence of steps is repeated one or more times, the improvement which consists in increasing the particle size of said propping agent in each succeeding fracturing step.

2,774,432

## VALVE DEVICE FOR FIRE EXTINGUISHERS AND THE LIKE

Joseph L. Danziger, Brooklyn, N. Y., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut

Application September 8, 1954, Serial No. 454,670
4 Claims. (Cl. 169—31)



1. A valve device for attachment to an apertured wall of a container adapted to hold a fire extinguishing composition under pressure, comprising a unitary assembly of an imperforate frangible sealing plate, a washer formed of elastomeric, dimensionally stable material which is chemically resistant to fire extinguishing compositions overlying said sealing plate, a carrier holding the sealing plate and washer in fluid-tight engagement and adapted to provide with the sealing plate and washer a closure for the apertured wall of the container, a rigid, longitudinally recessed member extending outwardly through the opening in the washer and frictionally held thereby, said rigid member being adapted to be manually forced inwardly to burst the sealing plate and provide a nozzle for the discharge of the fire extinguishing composition from the container.

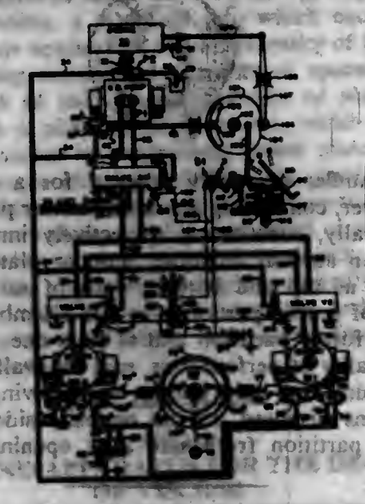
2,774,433

## TWO-POSITION CONSTANT SPEED SEMI-AUTOMATIC PROPELLER PITCH CONTROL

Clinton Corum, San Diego, Calif.

Application September 8, 1952, Serial No. 308,437
8 Claims. (Cl. 170—160.16)

2. Constant propeller speed maintaining means characterized by having dual settings, comprising a guided plunger movable parallel to the propeller axis of rotation, fly-weights operatively connected to said plunger, a fly-weight counterbalancing spring means operatively connected with said plunger to bias the plunger in one direction, connection means for operatively connecting said plunger to the blades of a propeller for pitch control such that movement of the plunger in said one direction reduces the pitch of the blades, and means to add to the fly-weight counterbalancing force of said spring means comprising an auxiliary spring and a spring stop means both connected to said plunger for normally moving with the plunger, and means for arresting said spring stop means temporarily to render said auxiliary spring effective and additive to said spring means.



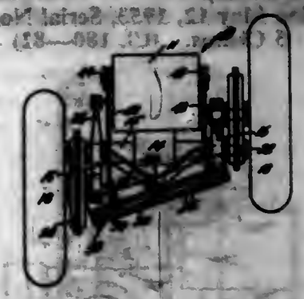
2,774,434

## STEERING CONTROL FOR INDUSTRIAL TRUCK WITH HYDRAULIC WHEEL DRIVE MOTORS

Walter Ferris, Milwaukee, Wis., assignor to The Oilgear Company, Milwaukee, Wis., a corporation of Wisconsin

Original application September 28, 1951, Serial No. 248,830. Divided and this application May 11, 1953, Serial No. 354,293
13 Claims. (Cl. 180—6.3)

1. A drive for a vehicle having a body, a plurality of wheels for supporting said body and including a pair of driving wheels, and means for steering said vehicle including a steering wheel; said drive comprising two hydraulic motors each of which is connected to one of said driving wheels and has means for varying its displacement, means for supplying motive liquid to both of said motors to enable the same to rotate said driving wheels, a cam wheel having a cam track thereon, means for rotating said cam wheel in response to rotation of said steering wheel, control means for effecting operation of the displacement varying means of each of said motors and including an element for adjusting said control, and a cam follower carried by each of said elements and engaging said cam track to cause said elements to adjust said control means in response to rotation of said cam wheel; said cam track being so shaped that during rotation of said cam wheel in either direction from a neutral position said track will hold the element of the control means for one of said motors stationary and will move the element of the control means for the others of said motors in a direction to cause that control means to effect a reduction in the displacement of said other motor.



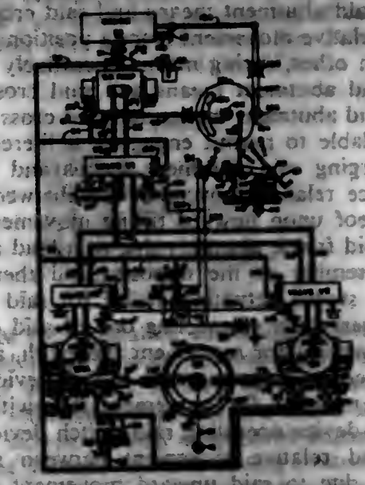
2,774,435

## LEVELING TRACTOR AND DRAWBAR CONSTRUCTION

Owen J. Mattson, Connell, Wash., assignor of one-fourth to Arthur C. Johnson, Connell, Wash.

Application March 28, 1955, Serial No. 497,153
2 Claims. (Cl. 180—41)

1. In a leveling tractor the combination with a frame; a pair of power driven traction wheels supporting the tractor, manually controlled powered means for movement of the wheels to selective vertical positions in the planes of said wheels; and a taut cable having its ends anchored relative to the axes of said wheels and extending downwardly under and supporting said frame; of a laterally extending vertically tiltable guidebar journaled substantially at the lateral center of said tractor on a horizontal longitudinal axis; a drawbar pivotally united to said tractor spaced from its forward end, the rearward end of said drawbar being associated with and guided for lateral swinging movements by said guidebar; cables



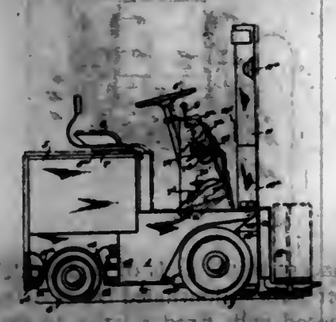
anchored adjacent to the ends of said guidebar extending upwardly over pulleys journaled on said frame and having their opposed ends fixed relative to the axes of said wheels, whereby the guidebar is maintained in substantially parallel relationship to the surface of the ground over which the tractor traverses.

2,774,436

## HYDRAULIC DRIVE FOR INDUSTRIAL TRUCKS AND COMBINED ENGINE AND PUMP CONTROL THEREFOR

Walter Ferris, Milwaukee, Wis., assignor to The Oilgear Company, Milwaukee, Wis., a corporation of Wisconsin

Application September 26, 1951, Serial No. 248,830
3 Claims. (Cl. 180—66)



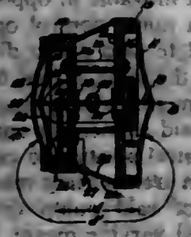
1. A drive for a vehicle having a pair of driving wheels, said drive comprising a hydraulic motor connected to each of said wheels, a pump for supplying motive liquid to said motors and having means for varying its displacement, fluid channels connecting said pump to both of said motors including two reversing valves each of which is connected between one of said motors and said pump, means for shifting each of said valves to reverse the flow of liquid to each of said motors and thereby reverse each of said motors, an internal combustion engine connected to said pump to drive the same and having means for varying its speed, an element movable in opposite directions from a neutral position, a pump control operable by said element and connected to said pump displacement varying means for operating the same, means for transmitting motion from said element to said speed varying means, means for moving said element in opposite directions selectively from its neutral position to cause said pump control and said motion transmitting means to effect simultaneous operation of said pump displacement varying means and said speed varying means, and means responsive to movement of said element in one of said directions from its neutral position for effecting operation of said valve shifting means.

2,774,437

## OVERLOAD RESPONSIVE SWITCH MECHANISM FOR INDUSTRIAL ELEVATING TRUCK

Edward H. Rands, Cleveland, Ohio, assignor, by mesne assignments, to The Baker-Raulang Company, a corporation of Delaware

Application May 12, 1953, Serial No. 354,524
5 Claims. (Cl. 186—82)



1. In a vehicle having a frame assembly, means for supporting one end of said frame assembly comprising a wheel, means for connecting said wheel to said frame assembly including a longitudinal member extending longitudinally of said frame assembly, means connecting one end of said longitudinal member to said frame assembly and comprising a cross member carried by said longitudinal member at said one end thereof and extending transversely thereof and on opposite sides thereof, abutment means fixed to said frame assembly on opposite sides of said longitudinal member, said cross member being positioned below said abutment means, means connecting said abutment means and said cross member for limited relative movement from a position in engagement with each other, spring means operatively connected between said abutment means and said cross member for urging said abutment means and said cross member apart and yieldable to permit engagement thereof, said spring means urging said abutment means and cross member to produce relative movement therebetween and separation thereof upon upward tilting movement of said one end of said frame assembly due to a load applied to said frame assembly at the opposite end thereof, a switch device, a switch actuating device for said switch device, means operatively connecting one of said devices to said frame assembly for movement therewith, and means operatively connecting the other of said devices to said longitudinal member for movement therewith, said switch actuating device operating said switch device upon a predetermined relative movement between said abutment members due to said upward movement of said frame assembly.

2,774,438

## MECHANICAL DAMPING MEANS FOR THE DIAPHRAGMS OF MICROPHONES, SPEAKERS, AND THE LIKE

Benjamin B. Bauer, Oak Park, Ill., assignor to Shure Brothers Incorporated, Chicago, Ill., a corporation of Illinois

Application April 25, 1951, Serial No. 222,747
7 Claims. (Cl. 181—31)

1. In a sound translating device including a diaphragm adapted to vibrate, energy-absorbing means for damping such diaphragm vibrations throughout the ordinary sound frequency spectrum comprising non-gaseous dissipative means, and means for connecting said diaphragm to such damping means including a rigid member attached to said diaphragm over a relatively small area thereof.

2,774,439

## MUFFLER FOR LAWN MOWER

Cecil E. Chaney, Hebron, Ohio, assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York

Application September 28, 1954, Serial No. 458,888
2 Claims. (Cl. 181—66)

1. A muffler especially adapted for a motor driven lawn mower, comprising a pair of circular plates arranged concentrically, constituting respectively inner and outer walls of an annular chamber, annular plates serving respectively as top and bottom walls of said chamber, a plurality of spaced partitions in said chamber comprising one imperforate partition and at least one partition having a plurality of perforations, said top wall having a gas inlet opening and said bottom wall having a group of perforations disposed on the opposite side of said imperforate partition from said inlet opening.

2,774,440

## GAS DISENGAGER

Eric V. Bergstrom, Short Hills, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York

Application December 6, 1954, Serial No. 473,232
2 Claims. (Cl. 183—1)

1. An apparatus for removing granular solids from a high pressure contacting chamber and reducing the gaseous pressure associated with said solids, which comprises in combination: an upright cylindrical disengaging chamber, a depressuring leg conduit of substantially less cross-sectional area than said contacting chamber and said disengaging chamber extending from said contacting chamber into the upper end of said disengaging chamber and terminating centrally on a downwardly facing open discharge end therein, a solid upright frusto-conical shaped hood with sides extending downwardly and outwardly at an angle with the horizontal greater than 30 degrees to a region at least adjacent the walls of said disengaging chamber to thereby prevent substantially all free surface flow of granular solids as the solids issue from said conduit, a first plurality of vertically spaced horizontal plates all situated below said hood and all equipped with a plurality of uniformly spaced rectangular apertured, the uppermost of said first plurality of plates being situated immediately below said hood, a plurality of nipples of rectangular cross-sectional shape depending from each of said plates, one such nipple depending from each of said apertures and said nipples from each plate terminating on a common level intermediately between the plate from which the nipples depend and the one next below so that a horizontally continuous gas space is formed above the lower ends of the nipples and a horizontally continuous accumulation of contact material is formed on the plate below the nipples, a plurality of passageways extending from said chamber below each of said plates but above the lower end of each row of nipples so that gas will be removed from each of said gas spaces at a plurality of points, a manifold into which each of said gas passageways connects, a second plurality of horizontal plates extending across said chamber at spaced vertical intervals, each of said second plurality of plates being equipped with a plurality of apertures, which apertures decrease in number in successively lower plates and are arranged in staggered relationship to one another so that each plate below the upper receives proportional solids flow from the one above and the uppermost of said second plurality of plates being positioned immediately below the lower ends of the nipples extending downwardly from the lowermost of said first plurality of plates, and a central solids outlet conduit extending downwardly from the bottom of said chamber.

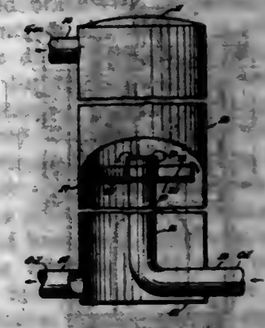
2,774,441

## PROCESS AND APPARATUS FOR THE DEGASSING OF VISCOSE

Aart Boersma, Velp, Netherlands, assignor to American Enka Corporation, Enka, N. C., a corporation of Delaware

Application November 30, 1953, Serial No. 395,161
Claims priority, application Netherlands February 9, 1953
5 Claims. (Cl. 183—2.5)

4. The method of degassing spinning solutions that comprises, passing succeeding volumes of a spinning solution upwardly through a column and spilling the same into a zone at the top of the column while adjusting the temperature of the viscose entering the column and the pressure in said zone to cause boiling to occur in the column but to terminate before the solution spills into said zone and recovering the degassed solution from said zone.



2,774,442

## GAS SEPARATOR

Harold H. Wright, Tulsa, Okla., assignor to Gulf Oil Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

Application April 29, 1954, Serial No. 426,467
6 Claims. (Cl. 183—2.7)

1. In a device for continuously separating entrained and occluded hydrocarbon gases from crude petroleum comprising an enclosing shell, an inlet connection to said shell to permit the introduction therein to of a mixed stream of liquid and gas, a connection from a high point of said shell to permit the discharge of separated gas therefrom, a connection from a low point of said shell to permit the discharge of liquid therefrom, the improvement which comprises: a tray positioned in said shell, laterally concentric therewith, spaced from the walls

thereof, and vertically intermediate of the said inlet connection and the said liquid discharge connection; pierced areas in the deck of said tray; a movable plate positioned on the deck of the said tray, having pierced areas corresponding in position to those in the deck of the said tray, and rotatably movable over the deck of the said tray to vary the relative positions of pierced areas of tray and plate from full coincidence to zero coincidence.

2,774,443

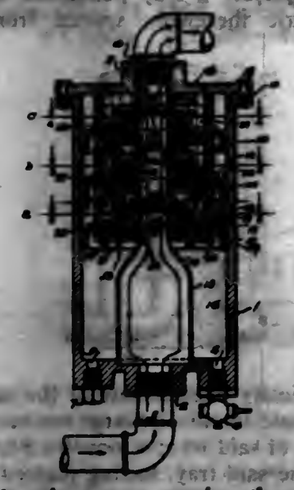
## GAS SEPARATOR

James Slayter, Newark, Ohio, assignor to Owens-Corning Fiberglas Corporation, a corporation of Delaware

Application June 23, 1953, Serial No. 363,516
5 Claims. (Cl. 183—51)

1. Apparatus for separating entrained particles from a gas stream including, in combination, an elongated bag-like unit, said unit being formed of an assemblage of relatively fine interfelted glass fibers, a frame including a rectangularly shaped portion adapted to engage the unit at the open end thereof, said unit having a retroflexed portion forming inner and outer walls of glass fibers, the end of the retroflexed portion being closed and the closed zone disposed adjacent the entrance of the unit, a plurality of rods having end portions secured to the frame, said rods being shaped to engage the unit at spaced zones shaping the unit into a plurality of chambers of substantially triangular cross-section.

2,774,444



## AIR SEPARATOR

Thomas C. Scully, Chicago, Ill., assignor to Chicago Railway Equipment Company, Chicago, Ill., a corporation of Illinois

Application June 18, 1954, Serial No. 435,752
6 Claims. (Cl. 183—91)

1. An air separator comprising an elongated casing having an inlet near one end for laden air and a discharge opening near the other end for cleansed air, at least two cleaning units provided in said casing and arranged sequentially with said air inlet for movement therethrough of the air to the discharge opening, each cleaning unit comprising an air distributing member having a plurality of passageways disposed in a plane normal to the longi-

tudinal axis of the casing and forming a part of the path of travel of the air through the separator, interceptor vanes on the casing forming bucket-like recesses opposing but spaced from the outer ends of said passageways, said passageways being curved, whereby relatively heavy

particles in the air stream passing therethrough will be directed into said recesses, the cross section area of the passageways in the air distributing member of the cleaning unit nearest the air inlet being greater than that of the passageways in the next air distributing member.

---

2,774,445

**BRAKE ADJUSTOR**

George W. Prentiss III, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware

Application October 31, 1951, Serial No. 254,049

19 Claims. (Cl. 188—79.5)

17. An adjusting device comprising a first member, a second member threadedly received on said first member, a third member carried by said second member and having limited movement therewith, and stationary means providing predetermined abutments engageable with said third member at one side to produce rotation of said third member and at the other side to produce rotation of said second member.

**SHOCK ABSORBERS**

Christian Marie Lucien Louis Bourcier de Carbon, Neuilly-sur-Seine, France

Application October 14, 1952, Serial No. 314,714

Claims priority, application France May 5, 1952

2 Claims. (Cl. 188—88)

1. A double acting shock absorber of the class of those adapted to function as energy-dissipating brakes for cushioning the relative movement between two members without contributing to any substantial degree to the support or springing of said members; said shock absorber comprising, in combination, an air-tight and liquid-tight casing adapted to be connected to one of said members and enclosing a single substantially cylindrical working chamber, a working piston disposed in said chamber and adapted to reciprocate therein upon relative movement of the members, a slender piston rod of the conventional small diameter relative to the diameter of the cylinder which characterizes this class of shock absorber as opposed to fluid suspension devices, said piston rod having one end fixed to said piston and its opposite end secured to the other of said members, said rod passing through a packed opening in one end of said casing, a body of working liquid in said working chamber within which liquid the piston moves, and means providing severely restricted by-passing of the working liquid past the piston in both directions as the piston moves respectively in its compression and rebound strokes, and an anti-cavitation provision comprising the

following: a fixed body of compressible gaseous fluid within the single working chamber of the casing at the opposite end thereof, said fixed body of compressible gaseous fluid being under a permanent high pressure of at least about five atmospheres and a maximum pressure only sufficient to prevent the occurrence of cavitation in the working fluid upon movement of the piston and not enough to afford suspension means for the members, said provision also affording compensation in volume for the displacement of working liquid occasioned by the entrance of successive portions of the piston rod upon the compression stroke of the shock absorber, the sole operative agencies controlling the damping of the piston movement, comprising the liquid by-passing means and the compressible gaseous fluid body, being contained within the said chamber.

---

2,774,447

**SHOCK ABSORBER**

Christian Marie Lucien Louis Bourcier de Carbon, Neuilly-sur-Seine, France

Application April 17, 1952, Serial No. 282,812

Claims priority, application France December 10, 1951

3 Claims. (Cl. 188—88)

1. A shock absorber for use in damping the relative movements of two members, which comprises a housing

enclosing a working chamber, a body of working fluid in said chamber, an element adapted to reciprocate within said working fluid in said chamber, and means connecting said housing and said reciprocating element respectively with the two members, said fluid consisting of a pneumatic emulsion comprising an intimate mixture of liquid and gas under a pressure greater than atmospheric pressure even when the device is at rest.

---

2,774,448

**INERTIA RESPONSIVE SHOCK ABSORBER**

Clifford T. Hutton, Ashington, Va.

Application April 28, 1953, Serial No. 351,762

7 Claims. (Cl. 188—88)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A double acting shock absorber comprising a cylinder and piston, fluid storage means in connection with said cylinder, hydraulic fluid in said cylinder and storage means, valve means in connection with said cylinder, which valve means serves to bleed fluid around said piston through a by-pass upon rapid longitudinal acceleration of said cylinder, said valve means comprising a weighted sleeve surrounding said cylinder and being longitudinally spring centered to hold said by-pass in a closed position, a limiting mechanism in connection with said sleeve valve which permits the sleeve valve to move in either direction to the end of its travel thereby to open the by-pass when the cylinder is rapidly accelerated in either direction, but which limiting mechanism prevents the sleeve valve from returning beyond its centered and closed position when the cylinder is immediately and rapidly accelerated in the opposite direction.

2,774,449

**DOUBLE-ACTING TYPE SLACK ADJUSTER FOR BRAKES**

Bert Henry Brownell, Malmö, Sweden, assignor to Svenska Aktiebolaget Bromsregulator, Malmö, Sweden, a corporation of Sweden

Application January 7, 1955, Serial No. 480,323

6 Claims. (Cl. 188—196)

1. An automatic slack adjuster of the character described for brakes on railway cars and the like, comprising a brake rod included in the brake rigging and comprising a first non-rotatably part, a second non-rotatable part and an intermediate rotatable section having a non-effecting screw connection with said second part of said brake rod and being rotatable in both directions for increasing and reducing, respectively, the slack said adapted to be rotated in the direction for increasing the slack through the stress arising in said brake rod when braking, coacting clutch faces on said first part and said rotatable section of said brake rod for locking said rotatable section against rotation under the action of stress in said brake rod, a rotatable member on said brake rod, actuating means connected to the brake structure and adapted to rotate said rotatable member in one direction during application and in the other direction during release of the brake, clutch means between said rotatable member and said rotatable section of said brake rod for clutching said rotatable section to said rotatable member during rotation thereof in the direction in which said rotatable section is to be rotated for reducing the slack, movable abutment means on said first part of said brake rod, abutment means on said rotatable member coacting with said movable abutment means on said first part of said brake rod and shiftable angularly in relation thereto into one and the other of two different positions by the beginning of the rotation of said rotatable member occurring at application and release, respectively, of the brake, and said coacting abutment means on said first part of said brake rod and said rotatable member being adapted, when in said one of said two angularly different positions, in relation to one another, to prevent said clutch faces on said first part and said rotatable section of said brake rod from engaging one another up to a certain point of the rotation of said rotatable member occurring during application of the brake and, when in said other of said two angularly different positions in relation to one another, to permit said clutch faces to engage one another at any point of rotation of said rotatable member for locking said rotatable section against rotation under the action of stress arising in said brake rod at released brake.

---

2,774,450

**FOLDABLE, LIMP-WALLED ARTICLE OF LUGGAGE**

Harry R. Smallberg, New York, N. Y.

Application February 13, 1954, Serial No. 410,694

4 Claims. (Cl. 190—43)

1. In a foldable, limp-walled article of luggage of the character described, including limp front wall, rear wall and side walls and rigid top and bottom walls, said top and bottom walls and said side walls secured at right angles to one another, means for rigidifying the end sections of said article of luggage to enable it to rest erectly on its top and bottom walls when in folded state, comprising flat, rigid stiffening elements of a width equal approximately to the width of a side wall and of a height less than the height of a folded section of said article of luggage, and means for removably retaining one of said stiffening elements in each corner of said article of luggage flatly against the inner face of the side wall at said corner, said means for retaining the outer wall of each folded section in distended position comprising a relatively stiff resilient bar element the width of the outer wall of said article of luggage and a pocket formed on the outer wall portion of each folded section, transversely thereof, for retaining said resilient bar element in place.

## 2,774,481
## SHIFTABLE CLUTCH IN CHANGE-SPEED TRANSMISSION

Erwin Stumpp, Stuttgart-Untertürkheim, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany

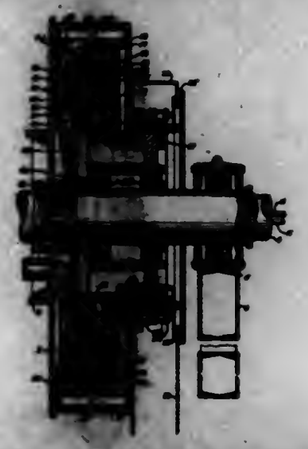
Application October 28, 1950, Serial No. 192,690
Claims priority, application Germany October 31, 1949
6 Claims. (Cl. 192—48)

1. In a transmission, the combination comprising two co-axially mounted spaced gears provided with external clutch teeth on their adjacent ends, an externally splined rotary member mounted between said gears co-axial therewith, the external splines of said member being formed with reduced ends and with a widened central section located between and contiguous with said ends and forming a pair of stop shoulders on either side face of said splines, and an internally splined clutch member mounted on and slidably engaging said rotary member, the internal splines of said clutch member having end surfaces and smooth sides, said clutch member being adapted to be shifted from a central neutral position in which it rides on said widened central section being disengaged from said gears to either one of two positions in which it engages said clutch teeth of one of said gears and the adjacent ones of said reduced ends of said external splines and with the end surfaces of the internal splines of said clutch member abutting said stop shoulders.

## 2,774,482
## MAGNETIC CLUTCH AND CONTROL THEREFOR

Franklin O. Winston, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware

Application February 11, 1952, Serial No. 270,985
13 Claims. (Cl. 192—84)



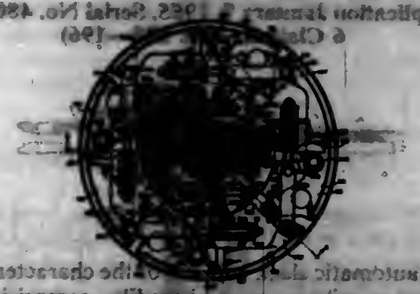
1. In a clutch having two rotatable members provided with surfaces for frictional engagement therebetween, magnetically controlled means for bringing the members into engagement, said means including an armature supported on one of the members for limited movement relative thereto and providing a magnetic circuit therewith, a pressure pad arranged contiguously said other member and attached to said one member for rotation therewith and having a force transmitting connection to said armature, centrifugally actuated mechanism interposed in the connection between said pad and armature for adjusting said connection as one of the surfaces wears, said mechanism comprising a screw threadedly engaging said connection, a weight responsive to centrifugal force for rotating said screw to thereby force said pressure pad and armature apart, means for preventing rotation of said screw in one direction, and means for detecting wear of said one surface.

## 2,774,483
## PNEUMATIC CLUTCHES

Sakio Hara Wilson, Wheaton Hills, Ill.

Continuation of application Serial No. 60,865, November 23, 1948. This application December 8, 1954, Serial No. 473,943

6 Claims. (Cl. 192—88)

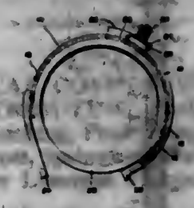


1. In a fluid pressure actuated clutch assembly for use in a recess formed in a drum flange, a rotary drive member, a rotary driven member, coacting friction discs interposed between said drive and driven members, certain of said friction discs being engageable with said drive member and certain of said friction discs being engageable with said driven member, said discs being axially movable within said recess, an attachable plate mounted on the outer end of said recessed drum flange, an axially expansible tube member disposed intermediate the outermost of said friction discs and said plate for actuating said friction discs, said outermost friction discs and said plate being non-rotatable relative to said axially expansible tube member, means conducting a pressure fluid to the inner axial side of said drum flange recess, and means including a flexible conduit for conducting said pressure fluid from said means to the outer axial face of said axially expansible tube member.

## 2,774,484
## CLUTCHES

Hale Kinchloe, Drexel Hill, Pa.

Application August 28, 1953, Serial No. 376,290
8 Claims. (Cl. 192—105)



1. A clutch comprising a driving member, a driven member having a drum, a plurality of spaced driving brackets carried by said driving member, each of said driving brackets having an abutment member thereon, a plurality of shoe members corresponding to said bracket members for engagement with said drum, a pivotal connection from each of said shoe members to the next driving bracket in one direction, a second pivotal connection from each of said shoe members to the next driving bracket in the opposite direction, said said shoe members having portions for driving engagement by said abutment member.

## 2,774,485
## CLUTCH OR BRAKE BAND

David N. Goldsmith, Wheeling, W. Va.

Application June 16, 1953, Serial No. 361,933
6 Claims. (Cl. 192—107)

1. In a clutch or brake band, semi-circular band sections having overlapping ends, means interconnecting said ends for relative pivotal movement about a radial axis, said interconnecting means including means permitting limited bodily relative radial movement between the ends of the sections.

## 2,774,486
## DUMP CHUTE FOR WAGONS

James Lawrence Pentler, Van Wert, Ohio

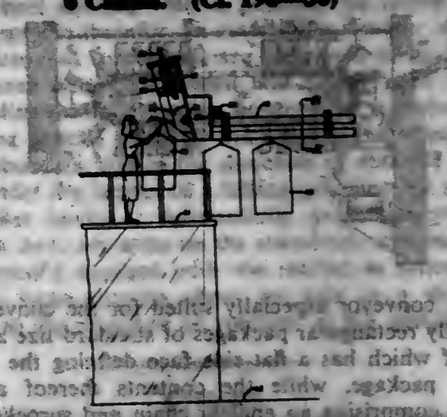
Application December 28, 1951, Serial No. 263,917
7 Claims. (Cl. 193—6)

1. A discharge-chute structure for incorporation in a wagon or like vehicle, comprising a body open at its top and having opposed side walls projecting downwardly from such top, a chute having a bottom wall and side walls overlapping those of the body, a pivot member, said chute side-walls having pairs of aligned openings arranged in rows generally parallel to said bottom wall for selective positioning of said chute in desired projecting relation laterally of said body and in desired angular relation to said body, each pair of said aligned openings being adapted to receive said pivot member, and means on said body for supporting said pivot member in fixed position adjacent the bottom of said body.

## 2,774,487
## FRONT FEED DEVICE FOR BUSINESS OFFICE MACHINES

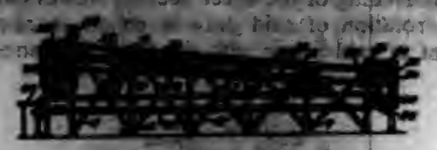
Andreas Schlieger, Rosenheim am Main, Germany, assignor to Toepfer-Werke Aktiengesellschaft, Fabrik für Büro- und Schreibmaschinen, Rosenheim am Main, Rodenbüttel, Germany, a German company

Application August 17, 1953, Serial No. 374,741
Claims priority, application Germany August 16, 1952
3 Claims. (Cl. 197—127)



1. A front feed device for business office machines comprising draw-in rollers for feeding a front feed sheet having at least one perforation therein, a feeler finger movable between an inoperative position remote from the feeding path of the front feed sheet and an operative position projecting across said path for engaging in a perforation of the front feed sheet to move with the latter during the feeding of the sheet, locking means effective to limit the rotation of said draw-in rollers in response to movement of said finger with the front feed sheet in the direction of feeding of the latter, spring means operative to urge said finger to said operative position thereof and in the direction of feeding of the front feed sheet, and control means normally rendering said spring means inoperative and effective, during the operation of said draw-in rollers, to release said spring means for urging said finger in the direction of feed of the sheet so that the tendency of the finger engaged in a perforation of the sheet to tear the sheet is thereby avoided.

## 2,774,488
## SEGREGATOR CONVEYOR

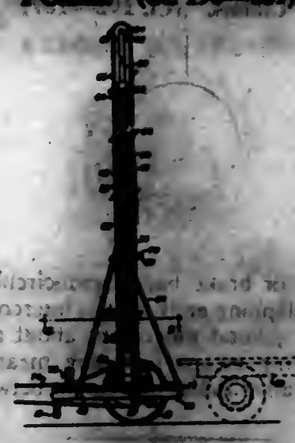


William J. Kaiser, Cincinnati, Ohio, assignor to The National Marking Machine Company, Cincinnati, Ohio, a corporation of Ohio

Application November 24, 1953, Serial No. 393,992
6 Claims. (Cl. 198—36)

1. In an apparatus for classifying garments on coat hangers into a plurality of different categories wherein there is provided a conveyor for transporting the garments from a loading zone to a distributing zone, and a plurality of rails at the distributing zone for receiving the garments from the conveyor, each rail being adapted to receive garments belonging to a particular category, the combination of a transverse carrier on said conveyor, means on said carrier for receiving the hooks of the coat hangers and supporting the garments in their travel from the loading zone to the distributing zone, and a plurality of dividers spaced at equal intervals along said carrier to divide said receiving means into as many slots as there are rails, said dividers being in the general form of flat, upstanding blocks, the side faces of which are parallel to the side faces of adjacent dividers to form transversely extending slots spaced along the carrier for receiving the hooks of the coat hangers.

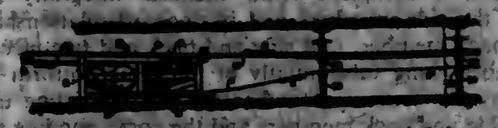
2,774,459
**RACK FOR COOLING FRESHLY GALVANIZED PIPE**
Oscar R. Olsen, Pittsburgh, Pa.
Application April 22, 1953, Serial No. 350,371
2 Claims. (Cl. 198—34)



1. A rack for cooling lengths of freshly galvanized pipe sections which comprises, a frame with upper and lower track levels and a transfer therebetween at one end, a pipe receiving station on the upper track level and a pipe discharge station on the lower track level at the opposite end of said frame from said transfer, conveyor means along said track levels having spaced abutments to shove separated pipe sections from the receiving to the discharge station and causing the pipe sections to rotate due to their frictional contact with the track to maintain a uniform distribution of the galvanize before it cools and hardens, said upper track level being disposed on a lateral slope at the pipe receiving station and horizontal at said transfer end, whereby to drain any excess galvanizing fluid from the rotating pipe sections and to match the inclination of the pipe sections when delivered at the receiving station.

2,774,460
**QUICK-FREEZE CONVEYORS**
Charles L. Speerhouse, Seattle, Wash.; Jean E. Speerhouse, administratrix of said Charles L. Speerhouse, deceased, assignor to Lewis Refrigeration & Supply Company, Seattle, Wash., a partnership
Application March 16, 1953, Serial No. 342,481
6 Claims. (Cl. 198—131)

1. A conveyor especially suited for the conveyance of generally rectangular packages of standard size and shape each of which has a flat side face defining the thickness of the package, while the contents thereof are being frozen, comprising an endless chain and sprocket wheels over which said chains run, the whole arranged with the chain's upper and lower runs generally horizontally disposed, and blades spaced along said chain at intervals somewhat exceeding the thickness of the package, each blade including three rigidly connected portions, namely, an inner base portion secured rigidly to a chain link, and having an upper package-supporting surface slanted, in the upper run, downwardly and forwardly with respect to the direction of advance, a connecting portion extending in the main approximately at a right angle to the chain's upper run, from the forward edge of the base portion's slanted package-supporting of surface, being that edge which is nearer the chain, and said connecting portion being of a height overall somewhat in excess of the height of the package, and an outer flange portion extending rearwardly from the outer edge of the connecting portion back over the base portion, and generally at a right angle to said connecting portion, and being of a width to leave less spacing between itself and the next blade, in the horizontal runs of the chain, than the thickness of the package, the spacing between connecting portions of successive blades being such, with relation to the upright dimension of the package, that with the package's side face resting upon the base's slanted package-supporting surface the upper forward edge of the package will lean against the upright connecting portion of the same blade.



2,774,461
**TOBACCO ELEVATOR**
Stanley Odell Young, Cynthiana, Ky.
Application March 22, 1954, Serial No. 417,799
1 Claim. (Cl. 214—139)

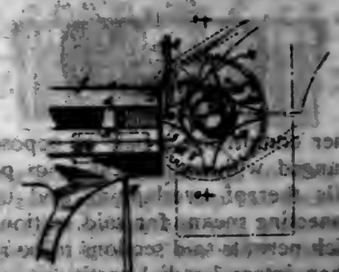
A tobacco elevator comprising a wheeled frame, an elongated tubular support fixed to said frame and extending upwardly therefrom, said support having a longitudinal slot extending downwardly from the upper end thereof, upper and lower telescoping members mounted within said elongated tubular support for raising and lowering movement with respect thereto, said lower telescoping member being tubular and having a longitudinal slot formed therein intermediate its ends in alignment with the longitudinal slot of said tubular support, a pin extending transversely outwardly from the lower end of said lower telescoping member through said support slot, said upper telescoping member being tubular and having a transverse handle extending from the lower portion thereof outwardly through said aligned slots, aperture means on said lower telescoping member cooperating with said handle for holding said upper telescoping member in vertically adjusted position with respect to said lower telescoping member, means on said frame connected with said pin for raising and lowering said telescoping members within said support while said telescoping members are held in a relative adjusted position and an endless chain conveyor extending between the bottom of said support and the top of said upper telescoping member, said endless chain being adjustable in length so as to operate at different heights within a slanted roof barn in accordance with the relative adjustment of said telescoping members and their vertical position with respect to said support.

2,774,462
**SPOOLED RIBBON SUPPORTED EXTENSIBLE BELT CONVEYOR**
William N. Peterkin, Morgantown, W. Va., assignor to Pittsburgh Consolidation Coal Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application September 1, 1950, Serial No. 551,941
12 Claims. (Cl. 198—139)

1. An extensible straight line belt conveyor comprising a mobile loading tailpiece at the loading terminal, material discharge means at the discharge terminal, ribbon material mounted on and extensible from a spool at one terminus, means at the other terminus for securing the free end of said ribbon material, means for supporting said ribbon material between the termini in a generally troughed shape, an endless single strand of flexible conveyer belting slidable along said ribbon material, said

strand being laced over said ribbon material in surface contact therewith, through each terminus and beneath said ribbon material out of contact therewith, and means beneath said ribbon material for supporting said conveyer belting between the said terminal.

2,774,463
**TYPOGRAPHICAL COMPOSING, CASTING AND DISTRIBUTING MACHINES**
Louis Rossetto, Flushing, Paul Hilpman, Garden City, and William B. Abbott, Springfield Gardens, N. Y., assignors to Mergenthaler Linotype Company, a corporation of New York
Application September 9, 1950, Serial No. 184,672
10 Claims. (Cl. 199—11)



1. A typographical composing, casting and distributing machine equipped with a main shaft and provided with a series of cams controlling the operation of various organs of the machine and adapted to make one complete rotation at each cycle of operation of the machine, means for driving said main cam shaft at a rate of speed of the order of twelve cycles per minute, a series of rotary cams for operating matrix releasing devices and adapted to make one complete rotation at each matrix releasing operation, a continuously rotating roll for operating said cams, means for driving the roll at a rate of speed of the order of 550 R. P. M., a continuously moving assembling belt to receive the matrices as they are released from their storage magazine and deliver them to the assembler, means for operating said belt at a rate of speed of the order of 125" per second, a continuously rotating star wheel located beyond the assembling belt to act upon the matrices as they leave therefrom and stack them in the assembler, means for rotating the star wheel at a rate of speed of the order of 375 R. P. M., a distributor comprising a set of continuously rotating screws for advancing the matrices along the distributor bar for return to their storage magazine, and means for rotating the distributor screws at a rate of speed of the order of 510 R. P. M.

5. In a typographical casting machine, the combination of a main shaft provided with a series of cams controlling the operation of various organs of the machine and adapted to make one complete rotation at each cycle of operation of the machine, means for driving said main cam shaft at a rate of speed substantially in excess of seven cycles per minute in order to cast slugs at a corresponding rate, a rotatable mold disk provided with two identical molds disposed diametrically opposite thereon, and means operated from the main cam shaft for imparting to the mold disk two one-quarter turns in each machine cycle whereby the molds are brought alternately into casting position in successive machine cycles to avoid overheating of the molds as a result of the increased rate of speed in the casting of successive slugs.

8. In a typographical composing machine, the combination of a matrix storage magazine arranged at an inclination of the order of 70°, an assembling belt to receive the matrices as they are released from their storage magazine and deliver them to the assembler, the angle of inclination of said belt being of the order of 17° 45' minutes, and means for driving the assembling belt at a rate of speed of the order of 125" per second.

2,774,464
**ASSEMBLING MECHANISM FOR TYPOGRAPHICAL COMPOSING MACHINES**
Paul Hilpman, Garden City, N. Y., assignor to Mergenthaler Linotype Company, a corporation of New York
Application May 11, 1953, Serial No. 353,957
3 Claims. (Cl. 199—27)

1. Assembling mechanism for typographical machines equipped with gravitational matrices and expansible spacebands, including, in combination, a constantly rotating starwheel formed with a plurality of radial arms, a driving spindle therefor, an assembling elevator wherein the matrices and spacebands are composed in line under the influence of the starwheel, and a pawl and ratchet free-wheeling driving coupling between the starwheel and the driving spindle whereby the starwheel is capable of turning about its axis in the direction of rotation of the spindle under the impact of a falling spaceband or matrix, said ratchet having a substantially greater number of teeth than there are arms on the starwheel, and said pawl being normally engaged with the ratchet to prevent the starwheel from turning about its axis in a direction opposite to the direction of rotation of the spindle.

2,774,465
**LINE STOP FOR TYPOGRAPHICAL CASTING MACHINES**
Charles G. Inglish, Corpus Christi, Tex., assignor to Mergenthaler Linotype Company, a corporation of New York
Application July 17, 1953, Serial No. 368,758
8 Claims. (Cl. 199—59)

1. A line stop for the first elevator or line transporter of a typographical casting machine, said transporter being formed in its opposite side walls with a pair of opposed horizontally disposed matrix supporting grooves as well as with a distinct pair of opposed horizontally disposed spaceband supporting grooves, which spaceband

supporting grooves are of less vertical height and are more widely spaced apart than the matrix supporting grooves but are located within the vertical limits of said grooves, characterized in that said line stop comprises an elongated, U-shaped resilient member shaped and spaced for a sliding movement in the spaceband supporting grooves, and a pair of thin and narrow abutment plates shaped and spaced for a sliding movement in the matrix supporting grooves, said abutment plates being made separate from but united to the two leg portions of the U-shaped resilient member at its open end, and said U-shaped resilient member being stressed at its closed end to exert a separating force upon its two leg portions when the line stop is inserted into the line transporter and thus to hold the abutment plates under lateral pressure in frictional face contact with the vertical walls of the matrix supporting grooves for braking purposes.

2,774,466

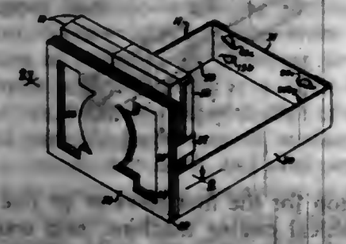
## CONTAINER

Andrew J. Lisko, Flint, Mich.

Application April 22, 1954, Serial No. 424,336

1 Claim. (Cl. 206—42)

A container comprising a pair of opposed cup-shaped sections arranged with cylindrical brim portions at the circular walls thereof overlapping and underlying one another, connecting means for said sections at said brim portions which permits said sections to be rotated relative to one another, integral radial partitions in the hollow of the section having the underlying brim portion and extending beyond the brim portion thereof and into the hollow of the other section and with the free edges thereof conforming to the general concaved contour of the interior of said other section, said partitions dividing the interiors of both of the sections into compartments, said underlying brim portion having a plurality of notches in its edge that extend different depths at different compartments into its respective cupped portion, said overlapping brim portion having a single notch in its edge and extending into its respective cupped portion a depth at least equal to that of the notch of greatest depth in said underlying brim portion, said notch in said overlapping brim portion being adapted to be registered with any one of the different size notches in the underlying brim portion by said rotation and thereby providing dispensing openings of different sizes to different compartments of the container.



2,774,467

## DISPENSING DEVICE FOR PACKAGED MERCHANDISE

Joseph Michiel, Long Beach, N. Y.

Substitute for abandoned application Serial No. 191,863, October 24, 1950. This application August 31, 1956 Serial No. 606,177

1 Claim. (Cl. 206—44.12)

A dispensing tray in combination with containers for merchandise, the tray comprising a substantially rigid bottom member to accommodate the containers arranged upright in at least one row; the tray further comprising side members in opposed relationship and a back member, said members being integrally formed with the bottom member and in planes substantially perpendicular thereto, a two-piece front member integrally formed with the side members and in opposed relationship with the back member, said side and back and two-piece front member being substantially of the same uniform height, means for securing together the corresponding ends of the side and back members and the corresponding ends of the two-piece front member; the tray further comprising a one-piece front member integrally formed with the bottom member and in juxtaposition with the outer surface of the two-piece front member, the one-piece front member having a height less than the height of the containers and greater than the height of the other members, a decorative member superposed on the outer surface of said one-piece front member, said decorative member having an opening made in each side thereof, a rectangular elastic member extending from each opening and around the containers, and a slit retaining member for each end of said rectangular elastic member coacting with the openings in the side of said decorative member.

2,774,468

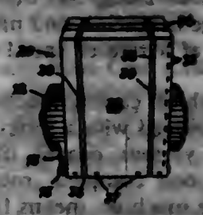
## CAN DISPLAY PACKAGE WITH LOCKING TABS

Ben Rous, Brooklyn, N. Y., assignor to Federal Carton Corporation, North Bergen, N. J., a corporation of New York

Application December 15, 1954, Serial No. 475,528

3 Claims. (Cl. 206—45.14)

2. A package comprising a cylindrical container having transversely outwardly extending, peripheral end beads, and a carton adapted for packaging and displaying said container, said carton being generally rectangular and comprising a bottom wall and four side walls connected to said bottom wall, said carton being open at its top, said container being mounted within said carton with one of its beads resting upon said bottom wall, the upper end portion of said container extending above the side walls of said carton, opposed walls having bottom tabs hingedly connected thereto and extending downwardly and inwardly from their hinge lines into frictional engagement with the upper surface of the lower bead, opposed walls having upper tabs hingedly connected to their upper edges and extending upwardly and inwardly into frictional engagement with the lower surface of the upper bead.



2,774,469

## PACKAGE PUMP UNIT

Kenneth R. Lang, Dayton, Ohio, assignor to The Tait Manufacturing Company, a corporation of Ohio

Application August 23, 1954, Serial No. 451,342

4 Claims. (Cl. 206—46)

3. A pump and package assembly comprising a cylindrical tank, a pump and motor of substantially less length than said tank mounted on the side of said tank, a base, means for securing said tank to said base with said tank extending horizontally and with said pump and motor uppermost thereon, a carton of substantially the same height as the distance from said base to the top of said pump and motor, said carton being of such width as to enclose said tank and of substantially lesser length than said tank to enclose said pump and motor with the ends of said tank projecting therebeyond, said carton having cutouts in both end walls thereof for receiving the ends of said tank therethrough, and means for securing the bottom edges of said carton to said base to complete said package.

2,774,470

## DISPENSING CARTON FOR PILLS OR OTHER SMALL ARTICLES

John H. O'Part, Toronto, Ontario, Canada

Application June 14, 1951, Serial No. 231,532

1 Claim. (Cl. 206—56)

A pill shipping and display package of the dispensing type comprising a box of rectangular shape with front, back, side, top and bottom walls, said front wall terminating above the bottom wall and thereby providing a slot across its lower edge for the full width thereof excepting for the thickness of the side walls, an elongated dispensing member adapted to extend for the greater part of its length through the slot and to be worked therein for the purpose of dispensing the pills therefrom, said dispensing member being of a length substantially equal to the height of the front wall of the box, of a width substantially equal to the width of the slot and of a cross-section conforming to the slot area, said dispensing member being disposed flush against the front wall of the box and over the slot, thereby providing a temporary closure to retain the pills within the box during shipment and display, and means for releasably securing the dispensing member to the box in its slot closing position.

2,774,471

## ANNULAR STRAND PACKAGE WITH FABRIC COVER

James E. Williams, Springfield, Pa., assignor to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware

Application March 6, 1953, Serial No. 340,847

6 Claims. (Cl. 206—59)

1. In combination with an annular wound strand package, a tubularly-woven cover therefor comprising an intermediate section constituted of a plurality of layers of fabric that are generally concentrically superposed with respect to the axis of the package and extend over the entire inner surface of the package, and two sections joined to the intermediate section at the opposite ends thereof, each of the latter two sections comprising a single layer of fabric, said layers of the intermediate section being relatively movable and free of interconnection except for juncture with said latter-named sections, the cover extending from the inner surface of the package over both end surfaces thereof to dispose said latter-named sections in adjacent relationship along the outer peripheral surface of the package, said cover comprising a continuous yarn system extending progressively from one end of the cover to the other without seams throughout all of said sections and the layers thereof.

2,774,472

## SLIDE CARRYING MEANS

Frank C. Badalich, Chicago, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois

Application August 24, 1954, Serial No. 451,898

1 Claim. (Cl. 206—62)

Slide holding means comprising, in combination, an elongated tray having an open top and rectangular vertical and horizontal cross sections and transversely extending septums for separating slides which extend above the open top, the ends of said tray having U-shaped openings and downwardly and upwardly facing shoulders in the region of the upper portion thereof, and a cover telescoped with the upper portion of said tray, the ends of said cover having upwardly facing shoulders along the lower edges thereof and downwardly facing shoulders spaced upwardly from the lower edges thereof cooperating respectively with said shoulders on said tray to hold said cover thereon and to space its top side above the upper edges of the projecting slides, the end portions of said cover carrying the shoulders cooperating with said downwardly facing shoulders on said tray being sufficiently flexible to permit engagement and disengagement thereof and said U-shaped openings extending below said end portions of said cover to facilitate the insertion of an operating member to engage the inner side of either end portion to flex the same outwardly to effect disengagement of said shoulders.

## SUPPORT-PROTECTOR FOR FRAGILE ARTICLES

Philip M. Williams, Oakland, Maine, assignor to Keyes Fibre Company, Portland, Maine, a corporation of Maine

Application January 31, 1952, Serial No. 269,210

2 Claims. (Cl. 206—65)

2. A package comprising a rectangular box-like crate, a first rectangular support sheet within said crate, said sheet being constructed of molded-pulp material and having a set of deep, tangential, dome-shaped cavities and a set of arcuate segments of shallow dish-shaped cavities formed therein between adjacent dome-shaped cavities, each of said sets of cavities depending in the same direction, a plurality of truncated cone portions

formed integral with each of said shallow, disk-shaped cavities, there being a plurality of circular bosses formed integral with the central bottom portions of said dome-shaped cavities, said circular bosses depending from and projecting beyond the lower portions of said dome-shaped cavities down to the level of the lower ends of said cone portions, the lower ends of said circular bosses and of said cone portions resting on the bottom of said crate, a plurality of fragile objects supported within the cavities and segments of cavities in spaced relation to the bottom of said crate, a second support sheet identical with said first support sheet and turned end-for-end with respect thereto, said second support sheet overlying said fragile articles supported by said first support sheet to form an enclosed bottom layer and adapted to support a similar enclosed layer thereupon within said crate.

PACKAGING DEVICE FOR CYLINDRICAL OBJECTS
David B. Phillips, Berea, Ohio
Application August 2, 1954, Serial No. 447,269
2 Claims. (Cl. 206—65)

1. A shipping package of axially inflexible elongated articles having a flat base and a tapered nose section, comprising; a flat base plate having the upper flat surface thereof provided with at least one recessed horizontal seat against which the flat base of said inflexible article is seated; a flat cover plate of approximately equal dimensions to said base plate having at least one through aperture interconnecting the opposed flat faces thereof; and means for drawing said base and cover plates toward each other when positioned with respect to said article; said aperture being substantially concentrically disposed above said seat when said cover plate is superimposed over said base plate in vertically spaced relationship; said aperture having a plurality of radial dimensions along its axial length receiving the tapered nose section therein; said nose section projecting through and above the upper-most plane of said cover plate.

VALVE PACKAGE
Carl H. Morken, West Elmira, N. Y., assignor to The Kennedy Valve Mfg. Co., Elmira, N. Y., a corporation of New York
Application January 24, 1955, Serial No. 483,726
3 Claims. (Cl. 206—65)

1. A valve package comprising a plurality of valves of roughly T-form with a casing having oppositely extending portions to which pipe connections may be made and a stem portion to which is secured a gland nut through which a valve stem extends, a U-shaped inner liner of corrugated board having a web portion and flanges substantially normal thereto, said flanges having spaced sets of aligned apertures in the opposite sides thereof to receive the ends of the oppositely extending portions of the respective valves with the web portion of said liner adjacent the under portion of said valves, and a positioning member of corrugated board bent to hollow rectangular form snugly fitted about said liner and having overlapping end portions with spaced sets of aligned slots therein embracing said valve stems.

MACHINE FOR CLASSIFYING AND SEPARATING MATERIALS
William T. Doyle, Boston, Mass., assignor to Sturtevant Mill Company, Boston, Mass., a corporation of Massachusetts
Application October 25, 1954, Serial No. 464,442
9 Claims. (Cl. 209—139)

1. An improved centrifugal separator including a casing formed with a feed inlet for receiving a finely divided material, a material classifier mechanism mounted within the casing, a fan located on the casing above the classifier mechanism in a position to induce the flow of air upwardly through the classifier, upper and lower conduit means defining converging apertures for guiding material along reversely directed spiralling paths of movement, and said casing being formed with discharge outlet means for selectively releasing classified material carried in said spiralling paths of movement.

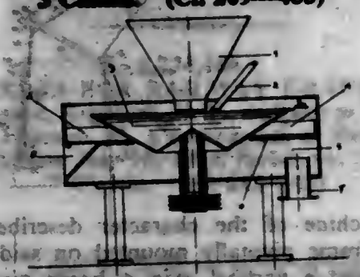
SCREEN CLAMPING MECHANISM
Harold C. Pollitz, Cedar Rapids, Iowa, assignor to Iowa Manufacturing Company of Cedar Rapids, Iowa, Cedar Rapids, Iowa, a corporation of Iowa
Application December 6, 1954, Serial No. 473,400
2 Claims. (Cl. 209—403)



1. Screen tightening apparatus for positioning a screen in a plane comprising in combination, a peripheral support frame surrounding said screen, a plurality of screen supports attached to said frame and having one surface thereof positioned in said plane for supporting said screen at a plurality of points, first means associated with said frame for attachment to the peripheral edge of said screen, second means for drawing said first means upwardly and outwardly toward said frame, third means for contact with said screen on the opposite side thereof from said support and inwardly from the peripheral edge of said screen for urging the central body of said screen downwardly securely against said supports when said second means is drawn toward said frame, and fourth means positioned substantially under said third means on the side of said screen opposite from said third means for contact with said screen whereby drawing said second means toward said frame clamps said screen tightly against said fourth means at a point inwardly of the peripheral edge of the screen.

CENTRIFUGAL OLIVE WASHER AND SEPARATOR
Giorgio Diefenbach, Monza, Italy
Application February 21, 1955, Serial No. 489,510
Claims priority, application Italy February 22, 1954
3 Claims. (Cl. 209—453)

1. A centrifugal washer for olives and other fruits, comprising a rotary basin, means for supplying said fruits into said basin, means for feeding water thereinto, a casing enclosing said basin from the side and bottom in spaced relationship, a perforated metal sheet dividing the space between said basin and said casing in a substantially horizontal plane, means for rotating said basin, an outlet in the bottom of said casing below said perforated sheet for discharging said water, an outlet in the sidewall of said casing for discharging said fruits above said perforated sheet, said basin being shaped to facilitate deposits of heavy foreign matter onto the bottom of said basin by gravity and carrying substantially radial arms to push said fruits towards said outlet above said sheet.

FILTERING APPARATUS
Ross Cummings, Berkeley, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission
Application January 5, 1945, Serial No. 571,421
6 Claims. (Cl. 210—184)

4. A pressure differential filtering apparatus, comprising a vertically movable tubular support mounted upon a supporting framework, a hollow porous filter element rotatably mounted on said tubular support, a valve unit having a rotatable portion attached to said filter element and a non-rotatable portion attached to said tubular support, a tube communicating with one side of said valve unit and extending into the interior of said filter element, a plurality of conduits housed within said tubular support and communicating with the other side of said valve unit, and a passage through the rotatable portion of said valve unit adapted to place said tube in communication with each of said plurality of conduits individually in a predetermined sequence upon rotation of the filter element.

BEVERAGE AND SNACK DISPENSER FOR AUTOMOBILES
Herbert Bunyan, Wallkill, N. Y.
Application October 21, 1953, Serial No. 388,318
12 Claims. (Cl. 211—86)

1. A serving tray device adapted to be mounted on an automobile instrument panel and comprising a bracket, means for attaching the bracket to an instrument panel, a serving tray, said bracket having a hollow cylindrical portion having a horizontally extending axis, a pair of members mounted within opposite ends of said cylindrical portion and projecting outwardly therefrom, means fixedly securing one of said members to said cylindrical portion against movement, means for mounting said other member for limited non-rotating sliding movement inwardly of said cylindrical portion toward said one member, a coil compression spring within said cylindrical portion and between said pair of members urging said other member outwardly in a direction away from said one member, said tray having a pair of extending arms, means pivotally connecting the ends of said tray arms with said pair of members respectively for rotation about the horizontal axis of said cylindrical portion, and means on said one member for releasably engaging the respective adjacent tray arm to maintain the tray against rotation in an outwardly extending operative horizontal position.

ARTICLE SUPPORTING RACK
Bernice E. Sievers and Eldred D. Sievers, Winona, Minn.
Application July 22, 1953, Serial No. 369,627
2 Claims. (Cl. 211—89)
